Bid Rejected

Lucid, Inc.-see attached for justification

Lucid's bid is non-compliant for the following reasons:

(Lucid is a distributor bidding Technalogix television translators.)

The RF tuner section of the processor is a 50 ohm input, not 75 ohm as required in the bid.

The specifications stated that the bidder must provide an external weatherproof enclosure for the translator systems for the Blair and Niobrara sites. Lucid did not supply a bid for these two (2) external enclosures as required.

Performance Bond - Lucid did not provide the option for the State to request a certified check or performance bond as stated in the specifications. Lucid's response was "the state will receive and accept goods prior to payment."

Lucid only submitted a list of three references to include address (station), contact name and telephone number versus the five requested. Lucid provided a list of testimonials, but contact information was not provided. NETC attempted to contact all three references numerous times over a three week period. One of the contacts responded, but reported that the Technalogix systems must be kept in a controlled environment because the frequency tends to drift with temperature changes. The responder told NETC that he had six (6) of these systems and they all have this problem. NETC has a real concern with this as none of the translator sites in question have an a controlled environment. The temperature at each location will be the same as ambient outside temperature. The translators are in locations where NETC does not have technicians on site. Translator systems with these issues cannot be considered by NETC for use at these sites.
