State Purchasing Bureau
1526 K Street, Suite 130
Lincoln, Nebraska 68508

Telephone: (402) 471-6500
Fax: (402) 471-2089

CONTRACT NUMBER
59912 04

PAGE 1 of 9	ORDER DATE 06/14/16
BUSINESS UNIT 25670163	BUYER JENNIFER CROUSE (AS)
VENDOR NUMBER: 1896057	
VENDOR ADDRESS: WIPRO LLC 2 TOWER CENTER BLVD STE 2200 EAST BRUNSWICK NJ 08816-1100	

THE CONTRACT PERIOD IS:

JULY 01, 2014 THROUGH JUNE 30, 2020

THIS SERVICE CONTRACT HAS BEEN AMENDED PER THE FOLLOWING INFORMATION:

THIS CONTRACT IS NOT AN EXCLUSIVE CONTRACT TO FURNISH THE SERVICES SHOWN BELOW, AND DOES NOT PRECLUDE THE PURCHASE OF SIMILAR SERVICES FROM OTHER SOURCES.

THE STATE RESERVES THE RIGHT TO EXTEND THE PERIOD OF THIS CONTRACT BEYOND THE TERMINATION DATE WHEN MUTUALLY AGREEABLE TO THE VENDOR/CONTRACTOR AND THE STATE OF NEBRASKA.

Original/Bid Document 4544 Z1

Contract to replace the functionality of the current Medicaid Eligibility and Enrollment (E&E) System with a modern COTS-based Eligibility and Enrollment Solution (EES) that meets the CMS Seven Standard and Conditions for the State of Nebraska as per the attached specifications for a six (6) year period from date of award. The contract may be renewed for two (2) additional two (2) year periods when mutually agreeable to the vendor and the State of Nebraska.

Vendor Contact: Thomas Stockdale
Phone: 813-335-0084
Fax: 573-659-0201
E-Mail: Thomas.Stockdale@Wipro.com

AMENDMENT TWO
59912 O4
Medicaid Eligibility and Enrollment (E&E) System for the State of Nebraska
Between
The State of Nebraska and Wipro, LLC

This Amendment (the "Amendment") is made by the State of Nebraska and Wipro, LLC, parties to Contract 59912 O4 (the "Contract"), and upon mutual agreement and other valuable consideration the parties agree to and hereby amend the contract as follows:

1. Vendor information is hereby superseded and replaced by:

Vendor Name: Wipro, LLC

2. The following contract lines will be amended per Attachment A upon signing of Contract Amendment:
 - a. Lines 101-103 are hereby deleted.
 - b. Lines 84-100 and 107-112 are hereby amended.
 - c. Lines 128 - 142 are hereby added.

This amendment and any attachments hereto will become part of the Contract. Except as set forth in this Amendment, the Contract is unaffected and shall continue in full force and effect in accordance with its terms. If there is conflict between this amendment and the Contract or any earlier amendment, the terms of this amendment will prevail.

IN WITNESS WHEREOF, the parties have executed this Amendment as of the date of execution by both parties below.

STATE OF NEBRASKA SERVICE CONTRACT AMENDMENT

State Purchasing Bureau
1526 K Street, Suite 130
Lincoln, NE 68508
Telephone: (402) 471-6500
Fax: (402) 471-2089

CONTRACT NUMBER
59912 04

PAGE 1 of 10	ORDER DATE 05/18/15
BUSINESS UNIT 25670081	BUYER JENNIFER CROUSE (AS)
VENDOR NUMBER: 1896057	
VENDOR ADDRESS: WIPRO LIMITED 2 TOWER CENTER BLVD STE 2200 EAST BRUNSWICK NJ 08816-1100	

THE CONTRACT PERIOD IS:

JULY 01, 2014 THROUGH JUNE 30, 2020

THIS SERVICE CONTRACT HAS BEEN AMENDED PER THE FOLLOWING INFORMATION:

THIS CONTRACT IS NOT AN EXCLUSIVE CONTRACT TO FURNISH THE SERVICES SHOWN BELOW, AND DOES NOT PRECLUDE THE PURCHASE OF SIMILAR SERVICES FROM OTHER SOURCES.

THE STATE RESERVES THE RIGHT TO EXTEND THE PERIOD OF THIS CONTRACT BEYOND THE TERMINATION DATE WHEN MUTUALLY AGREEABLE TO THE VENDOR/CONTRACTOR AND THE STATE OF NEBRASKA.

Original Contract/Bid Document 4544 Z1

Contract to replace the functionality of the current Medicaid Eligibility and Enrollment (E&E) System with a modern COTS-based Eligibility and Enrollment Solution (EES) that meets the CMS Seven Standard and Conditions for the State of Nebraska as per the attached specifications for a six (6) year period from date of award. The contract may be renewed for two (2) additional two (2) year periods when mutually agreeable to the vendor and the State of Nebraska. The State reserves the right to extend the period of this contract beyond the termination date when mutually agreeable to the vendor and the State of Nebraska.

The State may request that payment be made electronically instead of by state warrant. ACH/EFT Enrollment Form can be found at: <http://www.das.state.ne.us/accounting/forms/achenrol.pdf>

The Contractor is required and hereby agrees to use a federal immigration verification system to determine the work eligibility status of employees physically performing services within the State of Nebraska. A federal immigration verification system mean the electronic verification of the work authorization program authorized by the Illegal Immigration Reform and Responsibility Act of 1996, 8 U.S.C. 1324a, known as E-Verify Program, or an equivalent federal program designed by the United States Department of Homeland Security or other federal agency authorized to verify the work eligibility status of a newly hired employee.

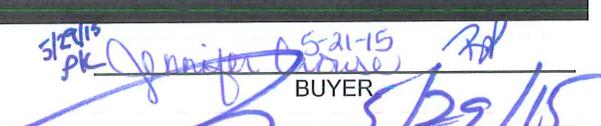

The contractor, by signature to the Request For Proposal, certifies that the contractor is not presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded by any federal department or agency from participating in transactions (debarred). The contractor also agrees to include the above requirements in any and all subcontracts into which it enters. The contractor shall immediately notify the Department if, during the term of this contract, contractor becomes debarred. The Department may immediately terminate this contract by providing contractor written notice if contractor becomes debarred during the term of this contract.

If the Contractor is an individual or sole proprietorship, the following applies:

1. The Contractor must complete the United States Citizenship Attestation Form, available on the Department of Administrative Services website at: http://das.nebraska.gov/lb403/attestation_form.pdf
2. If the Contractor indicates on such attestation form that he or she is a qualified alien, the Contractor agrees to provide the US Citizenship and Immigration Services documentation require to verify the Contractor's lawful presence in the United States using the Systematic Alien Verification for Entitlements (SAVE) Program.

3. The Contractor understands and agrees that lawful presence in the United States is required and the Contractor may be disqualified or the contract terminated if such lawful presence cannot be verified as required by Neb. Rev. Stat. §4-108.

The contract resulting from the Request for Proposal shall incorporate the following documents:

1. Amendment to Contract Award with the most recent dated amendment having the highest priority;
2. Contract Award and any attached Addenda;
3. The signed Request for Proposal form and the Contractor's proposal;
4. Amendments to RFP and any Questions and Answers; and
5. The original RFP document and any Addenda.

These documents constitute the entirety of the contract.

Unless otherwise specifically stated in a contract amendment, in case of any conflict between the incorporated documents, the documents shall govern in the following order of preference with number one (1) receiving preference over all other documents and with each lower numbered document having preference over any higher numbered document: 1) Amendment to Contract Award with the most recent dated amendment having the highest priority, 2) Contract Award and any attached Addenda, 3) the signed Request For Proposal form and the Contractor's proposal 4) Amendments to RFP and any Questions and Answers, 5) the original RFP document and any Addenda.

Any ambiguity in any provision of this contract which shall be discovered after its execution shall be resolved in accordance with the rules of contract interpretation as established in the State of Nebraska.

Once Requests For Proposal are opened they become the property of the State of Nebraska and will not be returned.

It is understood by the parties that in the State of Nebraska's opinion, any limitation on the contractor's liability is unconstitutional under the Nebraska State Constitution, Article XIII, Section III and that any limitation of liability shall not be binding on the State of Nebraska despite inclusion of such language in documents supplied by the contractor's bid response.

AMENDMENT ONE
59912 O4
Medicaid Eligibility and Enrollment (E&E) System for the State of Nebraska
Between
The State of Nebraska and Wipro Limited

This Amendment (the "Amendment") is made by the State of Nebraska and Wipro Limited, parties to Contract 59912 O4 (the "Contract"), and upon mutual agreement and other valuable consideration the parties agree to and hereby amend the contract as follows:

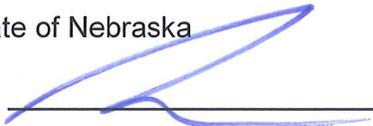

1. The following contract lines will be amended per Attachment A upon signing of Contract Amendment:
 - a. Lines 4, 19, 21, 71, and 74 – 83 are hereby deleted.
 - b. Lines 3, 6, 12-17, 20, 22-70, and 72-73 are hereby amended.
 - c. Lines 104 - 127 are hereby added.

This amendment and any attachments hereto will become part of the Contract. Except as set forth in this Amendment, the Contract is unaffected and shall continue in full force and effect in accordance with its terms. If there is conflict between this amendment and the Contract or any earlier amendment, the terms of this amendment will prevail.

IN WITNESS WHEREOF, the parties have executed this Amendment as of the date of execution by both parties below.

STATE OF NEBRASKA SERVICE CONTRACT AWARD

State Purchasing Bureau
1526 K Street, Suite 130
Lincoln, Nebraska 68508
OR
P.O. Box 94847
Lincoln, Nebraska 68509-4847
Telephone: (402) 471-6500
Fax: (402) 471-2089

CONTRACT NUMBER
59912 04

PAGE 1 of 8	ORDER DATE 06/13/14
BUSINESS UNIT 25710178	BUYER JENNIFER CROUSE (AS)
VENDOR NUMBER: 1896057	
VENDOR ADDRESS: WIPRO LIMITED 2 TOWER CENTER BLVD STE 2200 EAST BRUNSWICK NEW JERSEY 08816-1100	

AN AWARD HAS BEEN MADE TO THE VENDOR/CONTRACTOR NAMED ABOVE FOR THE SERVICES AS LISTED BELOW FOR THE PERIOD:

JULY 01, 2014 THROUGH JUNE 30, 2020

THIS CONTRACT IS NOT AN EXCLUSIVE CONTRACT TO FURNISH THE SERVICES SHOWN BELOW, AND DOES NOT PRECLUDE THE PURCHASE OF SIMILAR SERVICES FROM OTHER SOURCES.

THE STATE RESERVES THE RIGHT TO EXTEND THE PERIOD OF THIS CONTRACT BEYOND THE TERMINATION DATE WHEN MUTUALLY AGREEABLE TO THE VENDOR/CONTRACTOR AND THE STATE OF NEBRASKA.

Original/Bid Document 4544 Z1

Contract to replace the functionality of the current Medicaid Eligibility and Enrollment (E&E) System with a modern COTS-based Eligibility and Enrollment Solution (EES) that meets the CMS Seven Standard and Conditions for the State of Nebraska as per the attached specifications for a six (6) year period from date of award. The contract may be renewed for two (2) additional two (2) year periods when mutually agreeable to the vendor and the State of Nebraska. The State reserves the right to extend the period of this contract beyond the termination date when mutually agreeable to the vendor and the State of Nebraska.

The State may request that payment be made electronically instead of by state warrant. ACH/EFT Enrollment Form can be found at: <http://www.das.state.ne.us/accounting/forms/achenrol.pdf>

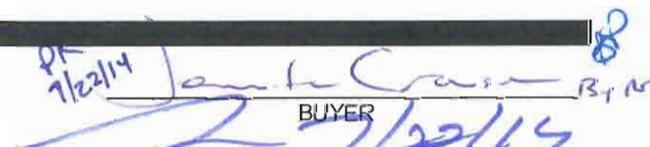

The Contractor is required and hereby agrees to use a federal immigration verification system to determine the work eligibility status of employees physically performing services within the State of Nebraska. A federal immigration verification system mean the electronic verification of the work authorization program authorized by the Illegal Immigration Reform and Responsibility Act of 1996, 8 U.S.C. 1324a, known as E-Verify Program, or an equivalent federal program designed by the United States Department of Homeland Security or other federal agency authorized to verify the work eligibility status of a newly hired employee.

The contractor, by signature to the Request For Proposal, certifies that the contractor is not presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded by any federal department or agency from participating in transactions (debarred). The contractor also agrees to include the above requirements in any and all subcontracts into which it enters. The contractor shall immediately notify the Department if, during the term of this contract, contractor becomes debarred. The Department may immediately terminate this contract by providing contractor written notice if contractor becomes debarred during the term of this contract.

If the Contractor is an individual or sole proprietorship, the following applies:

1. The Contractor must complete the United States Citizenship Attestation Form, available on the Department of Administrative Services website at: http://das.nebraska.gov/lb403/attestation_form.pdf
2. If the Contractor indicates on such attestation form that he or she is a qualified alien, the Contractor agrees to provide the US Citizenship and Immigration Services documentation require to verify the Contractor's lawful presence in the United States using the Systematic Alien Verification for Entitlements (SAVE) Program.
3. The Contractor understands and agrees that lawful presence in the United States is required and the Contractor may be disqualified or the contract terminated if such lawful presence cannot be verified as required by Neb. Rev. Stat. §4-108.

CHIEF EXECUTIVE OFFICER
DEPARTMENT OF HEALTH AND HUMAN SERVICES

BUYER
MATERIEL ADMINISTRATOR

STATE OF NEBRASKA SERVICE CONTRACT AWARD

State Purchasing Bureau
 1526 K Street, Suite 130
 Lincoln, Nebraska 68508
 OR
 P.O. Box 94847
 Lincoln, Nebraska 68509-4847
 Telephone: (402) 471-6500
 Fax: (402) 471-2089

CONTRACT NUMBER
59912 O4

PAGE 2 of 8	ORDER DATE 06/13/14
BUSINESS UNIT 25710178	BUYER JENNIFER CROUSE (AS)
VENDOR NUMBER: 1896057	

The contract resulting from the Request for Proposal shall incorporate the following documents:

1. Amendment to Contract Award with the most recent dated amendment having the highest priority;
2. Contract Award and any attached Addenda;
3. The signed Request for Proposal form and the Contractor's proposal;
4. Amendments to RFP and any Questions and Answers; and
5. The original RFP document and any Addenda.

These documents constitute the entirety of the contract.

Unless otherwise specifically stated in a contract amendment, in case of any conflict between the incorporated documents, the documents shall govern in the following order of preference with number one (1) receiving preference over all other documents and with each lower numbered document having preference over any higher numbered document: 1) Amendment to Contract Award with the most recent dated amendment having the highest priority, 2) Contract Award and any attached Addenda, 3) the signed Request For Proposal form and the Contractor's proposal 4) Amendments to RFP and any Questions and Answers, 5) the original RFP document and any Addenda.

Any ambiguity in any provision of this contract which shall be discovered after its execution shall be resolved in accordance with the rules of contract interpretation as established in the State of Nebraska.

Once Requests For Proposal are opened they become the property of the State of Nebraska and will not be returned.

It is understood by the parties that in the State of Nebraska's opinion, any limitation on the contractor's liability is unconstitutional under the Nebraska State Constitution, Article XIII, Section III and that any limitation of liability shall not be binding on the State of Nebraska despite inclusion of such language in documents supplied by the contractor's bid response.

ADDENDUM ONE to Contract Award
Terms and Conditions

Contract 59912 O4 to replace the functionality of the current Medicaid Eligibility and Enrollment (E&E) System with a modern COTS-based Eligibility and Enrollment Solution (EES) that meets the CMS Seven Standard and Conditions
Between
The State of Nebraska and Wipro LLC

The following Terms and Conditions, Addendum One of Contract 59912 O4 have been reviewed and agreed upon between Wipro LLC "Contractor" and the State of Nebraska "State". This addendum will become part of the contract to replace the functionality of the current Medicaid Eligibility and Enrollment (E&E) System with a modern COTS-based Eligibility and Enrollment Solution (EES) that meets the CMS Seven Standard and Conditions. The terms and conditions of this Addendum shall supersede, prevail and govern in the case of any inconsistencies with the Terms and Conditions indicated in Section III of the Request for Proposal.

By signing this Addendum the Contractor guarantees compliance with the provisions stated herein, agrees to the terms and conditions and certifies Contractor maintains a drug free work place environment.

A. GENERAL

The contract resulting from this Request for Proposal shall incorporate the following documents:

1. Amendment to Contract Award with the most recent dated amendment having the highest priority;
2. Contract Award and any attached Addenda;
3. The signed Request for Proposal form and the Contractor's Proposal;
4. Amendments to RFP and any Questions and Answers; and
5. The original RFP document and any Addenda.

These documents constitute the entirety of the contract.

Unless otherwise specifically stated in a contract amendment, in case of any conflict between the incorporated documents, the documents shall govern in the following order of preference with number one (1) receiving preference over all other documents and with each lower numbered document having preference over any higher numbered document: 1) Amendment to Contract Award with the most recent dated amendment having the highest priority, 2) Contract Award and any attached Addenda, 3) the signed Request for Proposal form and the Contractor's Proposal, 4) Amendments to RFP and any Questions and Answers, 5) the original RFP document and any Addenda.

Any ambiguity in any provision of this contract which shall be discovered after its execution shall be resolved in accordance with the rules of contract interpretation as established in the State of Nebraska.

Once proposals are opened they become the property of the State of Nebraska and will not be returned.

B. AWARD

All purchases, leases, or contracts which are based on competitive proposals will be awarded according to the provisions in the Request for Proposal. The State reserves the right to reject any or all proposals, wholly or in part, or to award to multiple bidders in whole or in part, and at its discretion, may withdraw or amend the Request for Proposal at any time. The State reserves the right to waive any deviations or errors that are not material, do not invalidate the legitimacy of the proposal, and do not improve the bidder's competitive position. All awards will be made in a manner deemed in the best interest of the State. The Request for Proposal does not commit the State to award a contract. If, in the opinion of the State, revisions or amendments will require substantive changes in proposals, the due date may be extended.

By submitting a proposal in response to this Request for Proposal, the bidder grants to the State the right to contact or arrange a visit in person with any or all of the bidder's clients.

Once an intent to award decision has been determined, it will be posted to the Internet at: <http://www.das.state.ne.us/materiel/purchasing/rfp.htm>

Grievance and protest procedure is available on the Internet at: <http://www.das.state.ne.us/materiel/purchasing/agencyservicesprocurementmanual/ProtestGrievanceProcedureForServices.doc>

Any protests must be filed by a vendor within ten (10) calendar days after the intent to award decision is posted to the Internet.

C. COMPLIANCE WITH CIVIL RIGHTS LAWS AND EQUAL OPPORTUNITY EMPLOYMENT / NONDISCRIMINATION

The contractor shall comply with all applicable local, State and Federal statutes and regulations regarding civil rights laws and equal opportunity employment. The Nebraska Fair Employment Practice Act prohibits contractors of the State of Nebraska, and their subcontractors, from discriminating against any employee or applicant for employment, with respect to hire, tenure, terms, conditions or privileges of employment because of race, color, religion, sex, disability, or national origin (Neb. Rev. Stat. §48-1101 to 48-1125). The contractor guarantees compliance with the Nebraska Fair Employment Practice Act, and breach of this provision shall be regarded as a material breach of contract. The contractor shall insert a similar provision in all subcontracts for services to be covered by any contract resulting from this Request for Proposal.

D. PERMITS, REGULATIONS, LAWS

The contractor shall procure and pay for all permits, licenses and approvals necessary for the execution of the contract. The contractor shall comply with all applicable local, state, and federal laws, ordinances, rules, orders and regulations.

E. OWNERSHIP OF INFORMATION AND DATA

The State of Nebraska shall have the unlimited right to publish, duplicate, use and disclose all information and data developed or derived by the contractor specifically for the State of Nebraska pursuant to this contract.

The contractor must guarantee that it has the full legal right to the materials, supplies, equipment, and other rights or titles (e.g. rights to licenses transfer or assign deliverables) necessary to execute this contract. The contract price shall, without exception, include compensation for all royalties and costs arising from patents, trademarks and copyrights that

are in any way involved in the contract. It shall be the responsibility of the contractor to pay for all royalties and costs, and the State must be held harmless from any such claims.

Retained Rights. Each Party owns, and will continue to own all right, title and interest in and to any inventions however embodied, know how, works in any media, software, information, trade secrets, materials, property or proprietary interest, that it owned prior to this Agreement, or that it created or acquired independently of its obligations pursuant to this Agreement, and in respect of any modifications or enhancements made thereto (collectively, "Retained Rights"). All Retained Rights not expressly transferred or licensed herein are reserved to the respective owner.

F. INSURANCE REQUIREMENTS

The contractor shall not commence work under this contract until he or she has obtained all the insurance required hereunder and such insurance has been approved by the State. If contractor will be utilizing any subcontractors, the contractor is responsible for obtaining the certificate(s) of insurance required herein under from any and all subcontractor(s). Contractor is also responsible for ensuring subcontractor(s) maintain the insurance required until completion of the contract requirements. The contractor shall not allow any subcontractor to commence work on his or her subcontract until all similar insurance required of the subcontractor has been obtained and approved by the contractor. Approval of the insurance by the State shall not limit, relieve or decrease the liability of the contractor hereunder.

If by the terms of any insurance a mandatory deductible is required, or if the contractor elects to increase the mandatory deductible amount, the contractor shall be responsible for payment of the amount of the deductible in the event of a paid claim.

1. WORKERS' COMPENSATION INSURANCE

The contractor shall take out and maintain during the life of this contract the statutory Workers' Compensation and Employer's Liability Insurance for all of the contractors' employees to be engaged in work on the project under this contract and, in case any such work is sublet, the contractor shall require the subcontractor similarly to provide Worker's Compensation and Employer's Liability Insurance for all of the subcontractor's employees to be engaged in such work. This policy shall be written to meet the statutory requirements for the state in which the work is to be performed, including Occupational Disease. This policy shall include a waiver of subrogation in favor of the State. The amounts of such insurance shall not be less than the limits stated hereinafter.

2. COMMERCIAL GENERAL LIABILITY INSURANCE AND COMMERCIAL AUTOMOBILE LIABILITY INSURANCE

The contractor shall take out and maintain during the life of this contract such Commercial General Liability Insurance and Commercial Automobile Liability Insurance as shall protect contractor and any subcontractor performing work covered by this contract from claims for damages for bodily injury, including death, as well as from claims for property damage, which may arise from operations under this contract, whether such operation be by the contractor or by any subcontractor or by anyone directly or indirectly employed by either of them, and the amounts of such insurance shall not be less than limits stated hereinafter.

The Commercial General Liability Insurance shall be written on an occurrence basis, and provide Premises/Operations, Products/Completed Operations, Independent Contractors, Personal Injury and Contractual Liability coverage. The policy shall include the State, and others as required by the Contract Documents, as an Additional Insured. This policy shall be primary, and any insurance or self-insurance carried by the State shall be considered excess and non-contributory. The Commercial Automobile Liability Insurance shall be written to cover all Owned, Non-owned and Hired vehicles.

3. INSURANCE COVERAGE AMOUNTS REQUIRED

a. WORKERS' COMPENSATION AND EMPLOYER'S LIABILITY

Coverage A	Statutory
Coverage B	
Bodily Injury by Accident	\$100,000 each accident
Bodily Injury by Disease	\$500,000 policy limit
Bodily Injury by Disease	\$100,000 each employee

b. COMMERCIAL GENERAL LIABILITY

General Aggregate	\$2,000,000
Products/Completed Operations Aggregate	\$2,000,000
Personal/Advertising Injury	\$1,000,000 any one person
Bodily Injury/Property Damage	\$1,000,000 per occurrence
Fire Damage	\$50,000 any one fire
Medical Payments	\$5,000 any one person

c. COMMERCIAL AUTOMOBILE LIABILITY

Bodily Injury/Property Damage	\$1,000,000 combined single limit
-------------------------------	-----------------------------------

d. UMBRELLA/EXCESS LIABILITY

Over Primary Insurance	\$1,000,000 per occurrence
------------------------	----------------------------

4. EVIDENCE OF COVERAGE

The contractor should furnish the State, with their proposal response, a certificate of insurance coverage complying with the above requirements to the attention of Buyer Name, Administrative Services, State Purchasing Bureau, 1526 K Street, Suite 130, Lincoln, NE 68508 (facsimile 402-471-2089). These certificates or the cover sheet shall reference the RFP number, and the certificates shall include the name of the company, policy numbers, effective dates, dates of expiration and amounts and types of coverage afforded. If the State is damaged by the failure of the contractor to maintain such insurance, then the contractor shall be responsible for all reasonable costs properly attributable thereto.

Notice of cancellation of any required insurance policy must be submitted to Buyer Name, Administrative Services State Purchasing Bureau when issued and a new coverage binder shall be submitted immediately to ensure no break in coverage.

G. COOPERATION WITH OTHER CONTRACTORS

The State may already have in place or choose to award supplemental contracts for work related to this Request for Proposal, or any portion thereof.

1. The State reserves the right to award the contract jointly between two or more potential contractors, if such an arrangement is in the best interest of the State.
2. The contractor shall agree to cooperate with such other contractors, and shall not commit or permit any act which may interfere with the performance of work by any other contractor.

H. INDEPENDENT CONTRACTOR

It is agreed that nothing contained herein is intended or should be construed in any manner as creating or establishing the relationship of partners between the parties hereto. The contractor represents that it has, or will secure at its own expense, all personnel required to perform the services under the contract. The contractor's employees and other persons engaged in work or services required by the contractor under the contract shall have no contractual relationship with the State; they shall not be considered employees of the State.

All claims on behalf of any person arising out of employment or alleged employment (including without limit claims of discrimination against the contractor, its officers or its agents) shall in no way be the responsibility of the State. The contractor will hold the State harmless from any and all such claims. Such personnel or other persons shall not require nor be entitled to any compensation, rights or benefits from the State including without limit, tenure rights, medical and hospital care, sick and vacation leave, severance pay or retirement benefits.

I. CONTRACTOR RESPONSIBILITY

The contractor is solely responsible for fulfilling the contract, with responsibility for all services offered and products to be delivered as stated in the Request for Proposal, the contractor's proposal, and the resulting contract. The contractor shall be the sole point of contact regarding all contractual matters.

If the contractor intends to utilize any subcontractors' services, the subcontractors' level of effort, tasks and time allocation must be clearly defined in the contractor's proposal. The contractor shall agree that it will not utilize any subcontractors not specifically included in its proposal, in the performance of the contract, without the prior written authorization of the State. Following execution of the contract, the contractor shall proceed diligently with all services and shall perform such services with qualified personnel in accordance with the contract.

The Contractor's failure to perform or delay in performing its contractual responsibilities (in whole or in part), to perform any part of the Services (whether in conformance with the Contract or at all), or to meet any agreed service levels shall be excused if and to the extent the Contractor's non-performance is solely attributable to the State's act or omission to act, delay, wrongful action, failure to provide inputs or approvals, or failure to perform its obligations under the Contract.

J. CONTRACTOR PERSONNEL

The contractor warrants that all persons assigned to the project shall be employees of the contractor or specified subcontractors, and shall be fully qualified to perform the work required herein. Personnel employed by the contractor to fulfill the terms of the contract shall remain under the sole direction and control of the contractor. The contractor shall include a similar provision in any contract with any subcontractor selected to perform work on the project.

Personnel commitments made in the contractor's proposal shall not be changed without the prior written approval of the State. Replacement of key personnel, if approved by the State, shall be with personnel of equal or greater ability and qualifications.

The State reserves the right to require the contractor to reassign or remove from the project any contractor or subcontractor employee.

In respect to its employees, the contractor agrees to be responsible for the following:

1. any and all employment taxes and/or other payroll withholding;
2. any and all vehicles used by the contractor's employees, including all insurance required by state law;
3. damages incurred by contractor's employees within the scope of their duties under the contract;
4. maintaining workers' compensation and health insurance and submitting any reports on such insurance to the extent required by governing State law; and
5. determining the hours to be worked and the duties to be performed by the contractor's employees.

Notice of cancellation of any required insurance policy must be submitted to the State when issued and a new coverage binder shall be submitted immediately to ensure no break in coverage.

K. STATE OF NEBRASKA PERSONNEL RECRUITMENT PROHIBITION

The contractor shall not, at any time, recruit or employ any State employee or agent who has worked on the Request for Proposal or project, or who had any influence on decisions affecting the Request for Proposal or project.

The State agrees that for the term of this Contract and for a period of one (1) year thereafter, the State will not directly or indirectly, recruit, solicit, discuss employment with, hire, employ or engage any of the Contractor's personnel then assigned to provide any aspect of the Services to the State or who were so assigned within the previous one (1) year period, or induce any such individual to leave the employ of the Contractor.

Contractor may waive the aforementioned restriction by providing written notice allowing the State to recruit, solicit, discuss employment with, hire, employ or engage Contractor's personnel

L. CONFLICT OF INTEREST

By submitting a proposal, bidder certifies that there does not now exist any relationship between the bidder and any person or entity which is or gives the appearance of a conflict of interest related to this Request for Proposal or project.

The bidder certifies that it shall not take any action or acquire any interest, either directly or indirectly, which will conflict in any manner or degree with the performance of its services hereunder or which creates an actual or appearance of conflict of interest.

The bidder certifies that it will not employ any individual known by bidder to have a conflict of interest.

M. PROPOSAL PREPARATION COSTS

The State shall not incur any liability for any costs incurred by bidders in replying to this Request for Proposal, in the demonstrations, or oral presentations, or in any other activity related to bidding on this Request for Proposal.

N. ERRORS AND OMISSIONS

The bidder shall not take advantage of any errors and/or omissions in this Request for Proposal or resulting contract. The bidder must promptly notify the State of any errors and/or omissions that are discovered.

O. BEGINNING OF WORK

The bidder shall not commence any billable work until a valid contract has been fully executed by the State and the successful contractor. The contractor will be notified in writing when work may begin.

P. ASSIGNMENT BY THE STATE

The State shall have the right to assign or transfer the contract or any of its interests herein to any agency, board, commission, or political subdivision of the State of Nebraska. There shall be no charge to the State for any assignment hereunder.

Q. ASSIGNMENT BY THE CONTRACTOR

The contractor may not assign, voluntarily or involuntarily, the contract or any of its rights or obligations hereunder (including without limitation rights and duties of performance) to any third party, without the prior written consent of the State, which will not be unreasonably withheld.

R. DEVIATIONS FROM THE REQUEST FOR PROPOSAL

The requirements contained in the Request for Proposal become a part of the terms and conditions of the contract resulting from this Request for Proposal. Any deviations from the Request for Proposal must be clearly defined by the bidder in its proposal and, if accepted by the State, will become part of the contract. Any specifically defined deviations must not be in conflict with the basic nature of the Request for Proposal or mandatory requirements. "Deviation", for the purposes of this RFP, means any proposed changes or alterations to either the contractual language or deliverables within the scope of this RFP. The State discourages deviations and reserves the right to reject proposed deviations.

S. GOVERNING LAW

The contract shall be governed in all respects by the laws and statutes of the State of Nebraska. Any legal proceedings against the State of Nebraska regarding this Request for Proposal or any resultant contract shall be brought in the State of Nebraska administrative or judicial forums as defined by State law. The contractor must be in compliance with all Nebraska statutory and regulatory law.

T. ATTORNEY'S FEES

In the event of any litigation, appeal or other legal action to enforce any provision of the contract, the contractor agrees to pay all expenses of such action, as permitted by law, including attorney's fees and costs, if the State is the prevailing party.

U. ADVERTISING

The contractor agrees not to refer to the contract award in advertising in such a manner as to state or imply that the company or its services are endorsed or preferred by the State. News releases pertaining to the project shall not be issued without prior written approval from the State.

V. STATE PROPERTY

The contractor shall be responsible for the proper care and custody of any State-owned property which is furnished for the contractor's use during the performance of the contract. The contractor shall reimburse the State for any loss or damage of such property, normal wear and tear is expected.

W. SITE RULES AND REGULATIONS

The contractor shall use its best efforts to ensure that its employees, agents and subcontractors comply with site rules and regulations while on State premises. If the contractor must perform on-site work outside of the daily operational hours set forth by the State, it must make arrangements with the State to ensure access to the facility and the equipment has been arranged. No additional payment will be made by the State on the basis of lack of access, unless the State fails to provide access as agreed to between the State and the contractor.

X. NOTIFICATION

During the bid process, all communication between the State and a bidder shall be between the bidder's representative clearly noted in its proposal and the buyer noted in Section II, A. Procuring Office and Contact Person of this RFP. After the award of the contract, all notices under the contract shall be deemed duly given upon delivery to the staff designated as the point of contact for this Request for Proposal, in person, or upon delivery by U.S. Mail, facsimile, or e-mail. Each bidder should provide in its proposal the name, title and complete address of its designee to receive notices.

1. Except as otherwise expressly specified herein, all notices, requests or other communications shall be in writing and shall be deemed to have been given if delivered personally or mailed, by U.S. Mail, postage prepaid, return receipt requested, to the parties at their respective addresses set forth above, or at such other addresses as may be specified in writing by either of the parties. All notices, requests, or communications shall be deemed effective upon personal delivery or three (3) days following deposit in the mail.

2. Whenever the contractor encounters any difficulty which is delaying or threatens to delay its timely performance under the contract, the contractor shall immediately give notice thereof in writing to the State reciting all relevant information with respect thereto. Such notice shall not in any way constitute a basis for an extension of the delivery schedule or be construed as a waiver by the State of any of its rights or remedies to which it is entitled by law or equity or pursuant to the provisions of the contract. Failure to give such notice, however, may be grounds for denial of any request for an extension of the delivery schedule because of such delay.

Either party may change its address for notification purposes by giving notice of the change, and setting forth the new address and an effective date.

For the duration of the contract, all communication between contractor and the State regarding the contract shall take place between the contractor and individuals specified by the State in writing. Communication about the contract between contractor and individuals not designated as points of contact by the State is strictly forbidden.

Y. EARLY TERMINATION

The contract may be terminated as follows:

1. The State and the contractor, by mutual written agreement, may terminate the contract at any time.
2. The State, in its sole discretion, may terminate the contract for any reason upon 30 days written notice to the contractor. Such termination shall not relieve the contractor of warranty or other service obligations incurred under the terms of the contract. In the event of cancellation the contractor shall be entitled to payment, determined on a pro rata basis, for products or services satisfactorily performed or provided.
3. The State may terminate the contract immediately for the following reasons:
 - a. if directed to do so by statute;
 - b. contractor has made an assignment for the benefit of creditors, has admitted in writing its inability to pay debts as they mature, or has ceased operating in the normal course of business;
 - c. a trustee or receiver of the contractor or of any substantial part of the contractor's assets has been appointed by a court;
 - d. fraud, misappropriation, embezzlement, malfeasance, misfeasance, or illegal conduct pertaining to performance under the contract by its contractor, its employees, officers, directors or shareholders;
 - e. an involuntary proceeding has been commenced by any party against the contractor under any one of the chapters of Title 11 of the United States Code and (i) the proceeding has been pending for at least sixty (60) days; or (ii) the contractor has consented, either expressly or by operation of law, to the entry of an order for relief; or (iii) the contractor has been decreed or adjudged a debtor;
 - f. a voluntary petition has been filed by the contractor under any of the chapters of Title 11 of the United States Code;
 - g. contractor intentionally discloses confidential information;
 - h. contractor has or announces it will discontinue support of the deliverable;

- i. second or subsequent documented "vendor performance report" form deemed acceptable by the State Purchasing Bureau.

Z. FUNDING OUT CLAUSE OR LOSS OF APPROPRIATIONS

The State may terminate the contract, in whole or in part, in the event funding is no longer available. The State's obligation to pay amounts due for fiscal years following the current fiscal year is contingent upon legislative appropriation of funds for the contract. Should said funds not be appropriated, the State may terminate the contract with respect to those payments for the fiscal years for which such funds are not appropriated. The State will give the contractor written notice thirty (30) days prior to the effective date of any termination, and advise the contractor of the location (address and room number) of any related equipment. All obligations of the State to make payments after the termination date will cease and all interest of the State in any related equipment will terminate. The contractor shall be entitled to receive just and equitable compensation for any authorized work which has been satisfactorily completed as of the termination date. In no event shall the contractor be paid for a loss of anticipated profit.

AA. BREACH BY CONTRACTOR

The State may terminate the contract, in whole or in part, if the contractor fails to perform its obligations under the contract in a timely and proper manner. The State may, by providing a written notice of default to the contractor, allow the contractor to cure a failure or breach of contract within a period of thirty (30) days (or longer at State's discretion considering the gravity and nature of the default) prior to the effective date of termination. Said notice shall be delivered by Certified Mail, Return Receipt Requested or in person with proof of delivery. Allowing the contractor time to cure a failure or breach of contract does not waive the State's right to immediately terminate the contract for the same or different contract breach which may occur at a different time. In case of default of the contractor, the State may contract the service from other sources and hold the contractor responsible for any excess cost occasioned thereby.

In the event of breach or default by the contractor, the State agrees to use or purchase services similar to the services provided by the contractor and will mitigate or minimize the costs associated with such recovery or replacement system.

BB. ASSURANCES BEFORE BREACH

If any document or deliverable required pursuant to the contract does not fulfill the requirements of the Request for Proposal/resulting contract, upon written notice from the State, the contractor shall deliver assurances in the form of additional contractor resources at no additional cost to the project in order to complete the deliverable, and to ensure that other project schedules will not be adversely affected.

CC. PENALTY

In the event that the contractor fails to perform any substantial obligation under the contract, the State may withhold all monies due and payable to the contractor, without penalty, until such failure is cured or otherwise adjudicated. Failure to meet the dates stipulated in the contract for the deliverables may result in an assessment of penalty due the State of \$1,000 dollars per day, until the deliverables are approved. Contractor will be notified in writing when penalty will commence.

DD. PERFORMANCE BOND

The selected contractor will be required to supply a certified check or a bond executed by a corporation authorized to contract surety in the State of Nebraska, payable to the State of Nebraska, which shall be valid for the life of the contract to include any renewal and/or extension periods. The amount of the certified check or bond must be the dollar amount of \$15,000,000.00. The check or bond will guarantee that the selected contractor will faithfully perform all requirements, terms and conditions of the contract. Failure to comply shall be grounds for forfeiture of the check or bond as liquidated damages. Amount of forfeiture will be determined by the agency based on loss to the State. The bond or certified check will be returned when the service has been satisfactorily completed as solely determined by the State, after termination or expiration of the contract.

EE. FORCE MAJEURE

Neither party shall be liable for any costs or damages resulting from its inability to perform any of its obligations under the contract due to a natural disaster, or other similar event outside the control and not the fault of the affected party ("Force Majeure Event"). A Force Majeure Event shall not constitute a breach of the contract. The party so affected shall immediately give notice to the other party of the Force Majeure Event. The State may grant relief from performance of the contract if the contractor is prevented from performance by a Force Majeure Event. The burden of proof for the need for such relief shall rest upon the contractor. To obtain release based on a Force Majeure Event, the contractor shall file a written request for such relief with the State Purchasing Bureau. Labor disputes with the impacted party's own employees will not be considered a Force Majeure Event and will not suspend performance requirements under the contract.

FF. PROHIBITION AGAINST ADVANCE PAYMENT

Payments shall not be made until contractual deliverable(s) are received and accepted by the State in accordance with the specific terms and conditions in the contract payment schedule.

GG. PAYMENT

State will render payment to contractor when the terms and conditions of the contract and specifications have been satisfactorily completed on the part of the contractor as solely determined by the State. Payment will be made by the responsible agency in compliance with the State of Nebraska Prompt Payment Act (See Neb. Rev. Stat. §81-2401 through 81-2408). The State may require the contractor to accept payment by electronic means such as ACH deposit. In no event shall the State be responsible or liable to pay for any services provided by the contractor prior to the Effective Date, and the contractor hereby waives any claim or cause of action for any such services.

HH. INVOICES

Invoices for payments must be submitted by the contractor to the agency requesting the services with sufficient detail to support payment. Invoices must be submitted to: Medicaid and Long-Term Care Division, P.O. Box 95026, Lincoln, NE 68509. The terms and conditions included in the contractor's invoice shall be deemed to be solely for the convenience of the parties. No terms or conditions of any such invoice shall be binding upon the State, and no action by the State, including without limitation the payment of any such invoice in whole or in part, shall be construed as binding or estopping the State with respect to any such term or condition, unless the invoice term or condition has been previously agreed to by the State as an amendment to the contract.

II. AUDIT REQUIREMENTS

All contractor books, records and documents relating to work performed or monies received under the contract (except the contractor's internal cost and payroll records) shall be subject to audit at any reasonable time upon the provision of reasonable notice by the State. These records shall be maintained for a period of five (5) full years from the date of final payment, or until all issues related to an audit, litigation or other action are resolved, whichever is longer. All records shall be maintained in accordance with generally accepted accounting principles.

In addition to, and in no way in limitation of any obligation in the contract, the contractor shall agree that it will be held liable for any State audit exceptions, and shall return to the State all payments made under the contract for which an exception has been taken or which has been disallowed because of such an exception. The contractor agrees to correct immediately any material weakness or condition reported to the State in the course of an audit.

JJ. TAXES

The State is not required to pay taxes of any kind and assumes no such liability as a result of this solicitation. Any property tax payable on the contractor's equipment which may be installed in a state-owned facility is the responsibility of the contractor.

KK. INSPECTION AND APPROVAL

Final inspection and approval of all work required under the contract shall be performed by the designated State officials. The State and/or its authorized representatives shall have the right to enter any premises where the contractor or subcontractor duties under the contract are being performed, and to inspect, monitor or otherwise evaluate the work being performed. All inspections and evaluations shall be at reasonable times and in a manner that will not unreasonably delay work.

LL. CHANGES IN SCOPE/CHANGE ORDERS

The State may, at any time with written notice to the contractor, make changes within the general scope of the contract. Changes in scope shall only be conducted with the written approval of the State's designee as so defined by the State from time to time. (The State retains the right to employ the services of a third party to perform any change order(s)).

The State may, at any time work is in progress, by written order, make alterations in the terms of work as shown in the specifications, require the performance of extra work, decrease the quantity of work, or make such other changes as the State may find necessary or desirable. The contractor shall not claim forfeiture of contract by reasons of such changes by the State. Changes in work and the amount of compensation to be paid to the contractor for any extra work so ordered shall be determined in accordance with the applicable unit prices of the contractor's proposal.

Corrections of any deliverable services or performance of work required pursuant to the contract shall not be deemed a modification requiring a change order.

The contractor may propose changes within the scope of the contract to address any alterations in the scope of work, or other impact to the services. Such changes shall only be approved with the written approval of the State's designee as so defined by the State from time to time.

MM. SEVERABILITY

If any term or condition of the contract is declared by a court of competent jurisdiction to be illegal or in conflict with any law, the validity of the remaining terms and conditions shall not be affected, and the rights and obligations of the parties shall be construed and enforced as if the contract did not contain the particular provision held to be invalid.

NN. CONFIDENTIALITY

All materials and information provided by the State or acquired by the contractor on behalf of the State shall be regarded as confidential information. All materials and information provided by the State or acquired by the contractor on behalf of the State shall be handled in accordance with Federal and State Law, and ethical standards. The contractor must ensure the confidentiality of such materials or information. Should said confidentiality be breached by a contractor; contractor shall notify the State immediately of said breach and take immediate corrective action.

It is incumbent upon the contractor to inform its officers and employees of the penalties for improper disclosure imposed by the Privacy Act of 1974, 5 U.S.C. 552a. Specifically, 5 U.S.C. 552a (i)(1), which is made applicable to contractors by 5 U.S.C. 552a (m)(1), provides that any officer or employee of a contractor, who by virtue of his/her employment or official position has possession of or access to agency records which contain individually identifiable information, the disclosure of which is prohibited by the Privacy Act or regulations established thereunder, and who knowing that disclosure of the specific material is prohibited, willfully discloses the material in any manner to any person or agency not entitled to receive it, shall be guilty of a misdemeanor and fined not more than \$5,000.

OO. PROPRIETARY INFORMATION

Data contained in the proposal and all documentation provided therein, become the property of the State of Nebraska and the data becomes public information upon opening the proposal. If the bidder wishes to have any information withheld from the public, such information must fall within the definition of proprietary information contained within Nebraska's public record statutes. All proprietary information the bidder wishes the State to withhold must be submitted in a sealed package, which is separate from the remainder of the proposal. The separate package must be clearly marked PROPRIETARY on the outside of the package. Bidders may not mark their entire Request for Proposal as proprietary. Bidder's cost proposals may not be marked as proprietary information. Failure of the bidder to follow the instructions for submitting proprietary and copyrighted information may result in the information being viewed by other bidders and the public. Proprietary information is defined as trade secrets, academic and scientific research work which is in progress and unpublished, and other information which if released would give advantage to business competitors and serve no public purpose (see Neb. Rev. Stat. §84-712.05(3)). In accordance with Attorney General Opinions 92068 and 97033, bidders submitting information as proprietary may be required to prove specific, named competitor(s) who would be advantaged by release of the information and the specific advantage the competitor(s) would receive. Although every effort will be made to withhold information that is properly submitted as proprietary and meets the State's definition of proprietary information, the State is under no obligation to maintain the confidentiality of proprietary information and accepts no liability for the release of such information.

PP. CERTIFICATION OF INDEPENDENT PRICE DETERMINATION/COLLUSIVE BIDDING

By submission of this proposal, the bidder certifies, that he or she is the party making the foregoing proposal that the proposal is not made in the interest of, or on behalf of, any undisclosed person, partnership, company, association, organization, or corporation; that the proposal is genuine and not collusive or sham; that the bidder has not directly or indirectly induced or solicited any other bidder to put in a false or sham proposal, and has not directly or indirectly colluded, conspired, connived, or agreed with any bidder or anyone else to put in a sham proposal, or that anyone shall refrain from bidding; that the bidder has not in any manner, directly or indirectly, sought by agreement, communication, or conference with anyone to fix the proposal price of the bidder or any other bidder, or to fix any overhead, profit, or cost element of the proposal price, or of that of any other bidder, or to secure any advantage against the public body awarding the contract of anyone interested in the proposed contract; that all statements contained in the proposal are true; and further that the bidder has not, directly or indirectly, submitted his or her proposal price or any breakdown thereof, or the contents thereof, or divulged information or data relative thereto, or paid, and will not pay, any fee to any corporation, partnership, company association, organization, proposal depository, or to any member or agent thereof to effectuate a collusive or sham proposal.

QQ. PRICES

All prices, costs, terms and conditions outlined in the proposal shall remain fixed and valid commencing on the opening date of the proposal until an award is made (and for bidder receiving award prices shall remain as bid for the duration of the contract unless otherwise so stated in the contract) or the Request for Proposal is cancelled.

Contractor also represents and warrants that all prices set forth in the contract and all prices in addition, which the contractor may charge under the terms of the contract, do not and will not violate any existing federal, state or municipal law or regulations concerning price discrimination and/or price fixing. Contractor agrees to hold the State harmless from any such violation. Prices quoted shall not be subject to increase throughout the contract period unless specifically allowed by these specifications.

RR. BEST AND FINAL OFFER

The State will compile the final scores for all parts of each proposal. The award may be granted to the highest scoring responsive and responsible bidder. Alternatively, the highest scoring bidder or bidders may be requested to submit best and final offers. If best and final offers are requested by the State and submitted by the bidder, they will be evaluated (using the stated criteria), scored and ranked by the Evaluation Committee. The award will then be granted to the highest scoring bidder. However, a bidder should provide its best offer in its original proposal. Bidders should not expect that the State will request a best and final offer.

SS. ETHICS IN PUBLIC CONTRACTING

No bidder shall pay or offer to pay, either directly or indirectly, any fee, commission compensation, gift, gratuity, or anything of value to any State officer, legislator or employee based on the understanding that the receiving person's vote, actions or judgment will be influenced thereby. No bidder shall give any item of value to any employee of the State Purchasing Bureau.

Bidders shall be prohibited from utilizing the services of lobbyists, attorneys, political activists, or consultants to secure the contract. It is the intent of this provision to assure that the prohibition of state contact during the procurement process is not subverted through the use

of lobbyists, attorneys, political activists, or consultants. It is the intent of the State that the process of evaluation of proposals and award of the contract be completed without external influence. It is not the intent of this section to prohibit bidders from seeking professional advice, for example consulting legal counsel, regarding terms and conditions of this Request for Proposal or the format or content of their proposal.

If the bidder is found to be in non-compliance with this section of the Request for Proposal, they may forfeit the contract if awarded to them or be disqualified from the selection process.

TT. INDEMNIFICATION

1. GENERAL

The contractor agrees to defend, indemnify, hold, and save harmless the State and its employees, volunteers, agents, and its elected and appointed officials (“the indemnified parties”) from and against any and all claims, liens, demands, damages, liability, actions, causes of action, losses, judgments, costs, and expenses of every nature, including investigation costs and expenses, settlement costs, and attorney fees and expenses (“the claims”), sustained or asserted against the State due to third party claims, arising directly and proximately out of, the willful misconduct, negligence, error, or omission of the contractor, its employees, subcontractors, consultants, representatives, and agents, except to the extent such contractor liability is attenuated by any action of the State which directly and proximately contributed to the claims.

2. INTELLECTUAL PROPERTY

The contractor agrees it will at its sole cost and expense, defend, indemnify, and hold harmless the indemnified parties from and against any and all third party claims, to the extent such claims arise out of, result from, or are attributable to the actual or alleged infringement or misappropriation of any patent, copyright, trade secret, trademark, or confidential information of any third party by the contractor or its employees, subcontractors, consultants, representatives, and agents; provided, however, the State gives the contractor prompt notice in writing of the claim. The contractor may not settle any infringement claim that will affect the State’s use of the Licensed Software without the State’s prior written consent, which consent may be withheld for any reason.

If a judgment or settlement is obtained or reasonably anticipated against the State’s use of any intellectual property for which the contractor has indemnified the State, the contractor shall at the contractor’s option and sole cost and expense promptly modify the item or items which were determined to be infringing, acquire a license or licenses on the State’s behalf to provide the necessary rights to the State to eliminate the infringement, or provide the State with a non-infringing substitute that provides the State the same functionality. At the State’s election, the actual judgment may be treated as a breach of warranty by the contractor, and the State may receive the remedies provided under this RFP.

3. PERSONNEL

The contractor shall, at its expense, indemnify and hold harmless the indemnified parties from and against any third party claim with respect to withholding taxes, worker’s compensation, employee benefits, or any other claim, demand, liability, damage, or loss of any nature relating to any of the personnel provided by the contractor.

UU. NEBRASKA TECHNOLOGY ACCESS STANDARDS

Contractor shall review the Nebraska Technology Access Standards, found at <http://nitc.nebraska.gov/standards/2-101.html> and ensure that products and/or services provided under the contract comply with the applicable standards. In the event such standards change during the contractor's performance, the State may create an amendment to the contract to request that contract comply with the changed standard at a cost mutually acceptable to the parties.

VV. ANTITRUST

The contractor hereby assigns to the State any and all claims for overcharges as to goods and/or services provided in connection with this contract resulting from antitrust violations which arise under antitrust laws of the United States and the antitrust laws of the State.

WW. DISASTER RECOVERY/BACK UP PLAN

The contractor shall have a disaster recovery and back-up plan, of which a copy should be provided to the State, which includes, but is not limited to equipment, personnel, facilities, and transportation, in order to continue services as specified under these specifications in the event of a disaster.

XX. TIME IS OF THE ESSENCE

Time is of the essence in this contract. The acceptance of late performance with or without objection or reservation by the State shall not waive any rights of the State nor constitute a waiver of the requirement of timely performance of any obligations on the part of the contractor remaining to be performed.

YY. RECYCLING

Preference will be given to items which are manufactured or produced from recycled material or which can be readily reused or recycled after their normal use as per state statute (Neb. Rev. Stat. §81-15, 159).

ZZ. DRUG POLICY

Contractor certifies it maintains a drug free work place environment to ensure worker safety and workplace integrity. Contractor agrees to provide a copy of its drug free workplace policy at any time upon request by the State.

AAA. EMPLOYEE WORK ELIGIBILITY STATUS

The Contractor is required and hereby agrees to use a federal immigration verification system to determine the work eligibility status of employees physically performing services within the State of Nebraska. A federal immigration verification system means the electronic verification of the work authorization program authorized by the Illegal Immigration Reform and Immigrant Responsibility Act of 1996, 8 U.S.C. 1324a, known as the E-Verify Program, or an equivalent federal program designated by the United States Department of Homeland Security or other federal agency authorized to verify the work eligibility status of a hired employee.

If the Contractor is an individual or sole proprietorship, the following applies:

1. The Contractor must complete the United States Citizenship Attestation Form, available on the Department of Administrative Services website at www.das.state.ne.us.

2. If the Contractor indicates on such attestation form that he or she is a qualified alien, the Contractor agrees to provide the US Citizenship and Immigration Services documentation required to verify the Contractor's lawful presence in the United States using the Systematic Alien Verification for Entitlements (SAVE) Program.
3. The Contractor understands and agrees that lawful presence in the United States is required and the Contractor may be disqualified or the contract terminated if such lawful presence cannot be verified as required by Neb. Rev. Stat. §4-108.

BBB. CERTIFICATION REGARDING DEBARMENT, SUSPENSION AND INELIGIBILITY

The contractor, by signature to this RFP, certifies that the contractor is not presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded by any federal department or agency from participating in transactions (debarred). The contractor also agrees to include the above requirements in any and all subcontracts into which it enters. The contractor shall immediately notify the State of Nebraska if, during the term of this contract, contractor becomes debarred. The State of Nebraska may immediately terminate this contract by providing contractor written notice if contractor becomes debarred during the term of this contract.

IN WITNESS WHEREOF, the parties have executed this Addendum as of the date of execution by both parties below.

Technical Proposal Volume 1 of 3
(FORMS, EXEC SUMMARY, OVERVIEW)

January 20, 2013

State of Nebraska
State Purchasing Bureau
1526 K Street, Suite 130
Lincoln, Nebraska 68508

Attn: Mr. Peter A Kroll & Mr. Robert Thompson

Subject: RFP 4544Z1 Medicaid Eligibility and Enrollment System Procurement

Wipro LLC. is pleased to submit the attached proposal in response to the State of Nebraska's Request for Proposal (RFP) No. 4544Z1 for the Medicaid Eligibility and Enrollment System procurement.

To meet the requirements and needs of the Nebraska Medicaid and Long Term Care program (MLTC), Wipro and IBM are pleased to propose the [SmartPro-MedEE](#) solution. This offering comprises of services through the Wipro and IBM partnership, software & hardware product implementation and ongoing hosting, support, and maintenance services. The [SmartPro-MedEE](#) solution offers Nebraska world class integration, configuration, implementation and deployment experts with the superior Cúram solution and expertise dedicated to project. Applying the knowledge and experience of our extensive healthcare IT; Wipro and IBM together will establish a firm foundation to support both immediate needs for Medicaid eligibility and enrollment modernization as well as the ability to leverage this foundation to build other Medicaid functions and agency needs in the future.

Our first-hand knowledge, experience and expertise across all facets of Medicaid and healthcare programs, as well enterprise solution architecting, deployment, hosting and operations capability, the Wipro IBM partnership represents world class systems and services delivered by proven organizations for Nebraska's Medicaid eligibility and enrollment health solution initiatives.

We look forward to this relationship to support the State of Nebraska's MLTC Eligibility and Enrollment strategy. We eagerly anticipate your response to our proposal in support of your new and exciting vision.

Warm Regards:

Rajeshwar Dayal Mitra
Vice President

Wipro LLC.

OPENING DATE AND TIME	PROCUREMENT CONTACT
January 7, 2014 2:00 p.m. Central Time	Peter A. Kroll Robert Thompson

This form is part of the specification package and must be signed and returned, along with proposal documents, by the opening date and time specified.

PLEASE READ CAREFULLY!

SCOPE OF SERVICE

The State of Nebraska, Administrative Services (AS), Materiel Division, Purchasing Bureau, is issuing this Request for Proposal, RFP Number 4544Z1 for the purpose of selecting a qualified contractor to replace the functionality of the current Medicaid Eligibility and Enrollment (E&E) System with a modern COTS-based Eligibility and Enrollment Solution (EES) that meets the CMS Seven Standard and Conditions.

Written questions are due no later than November 12, 2013, and should be submitted via e-mail to as.materielpurchasing@nebraska.gov. Written questions may also be sent by facsimile to (402) 471-2089.

Bidder should submit one (1) original and one (1) hard copy of the Technical Proposal and one (1) original and one (1) hard copy of the Cost Proposal. In the event of any inconsistencies among the proposals, the language contained in the original proposal shall govern. Proposals must be submitted by the proposal due date and time.

PROPOSALS MUST MEET THE REQUIREMENTS OUTLINED IN THIS REQUEST FOR PROPOSAL TO BE CONSIDERED VALID. PROPOSALS WILL BE REJECTED IF NOT IN COMPLIANCE WITH THESE REQUIREMENTS.

1. Sealed proposals must be received in State Purchasing by the date and time of proposal opening indicated above. No late proposals will be accepted. No electronic, e-mail, fax, voice, or telephone proposals will be accepted.
2. This form "REQUEST FOR PROPOSAL FOR CONTRACTUAL SERVICES" MUST be manually signed, in ink, and returned by the proposal opening date and time along with bidder's proposal and any other requirements as specified in the Request for Proposal in order to be considered for an award.
3. It is the responsibility of the bidder to check the website for all information relevant to this solicitation to include addenda and/or amendments issued prior to the opening date. Website address is as follows:
<http://das.nebraska.gov/materiel/purchasing/rfp.htm>
4. It is understood by the parties that in the State of Nebraska's opinion, any limitation on the contractor's liability is unconstitutional under the Nebraska State Constitution, Article XIII, Section 3, and that any limitation of liability shall not be binding on the State of Nebraska despite inclusion of such language in documents supplied with the contractor's bid or in the final contract.

BIDDER MUST COMPLETE THE FOLLOWING

By signing this Request For Proposal For Contractual Services form, the bidder guarantees compliance with the provisions stated in this Request for Proposal, agrees to the terms and conditions (see Section III) and certifies bidder maintains a drug free work place environment.

_____ I hereby certify that I am a Resident disabled veteran or business located in a designated enterprise zone in accordance with Neb. Rev Stat §73-107 and wish to have preference, if applicable, considered in the award of this contract.

FIRM: Wipro LLC

COMPLETE ADDRESS: 2 Tower Center Blvd, Suite 2200 East Brunswick, NJ 08816

Vice President

FORM A - BIDDER CONTACT SHEET

Form A

Bidder Contact Sheet

Request for Proposal Number 4544Z1

Form A should be completed and submitted with each response to this Request for Proposal. This is intended to provide the State with information on the bidder's name and address, and the specific person(s) who are responsible for preparation of the bidder's response.

Preparation of Response Contact Information	
Bidder Name:	Wipro LLC
Bidder Address:	2 Tower Center Blvd East Brunswick, NJ 08816
Contact Person & Title:	Anuj Kumar, General Manager
E-mail Address:	Anuj.Kumar25@Wipro.com
Telephone Number (Office):	573.635.2434
Telephone Number (Cellular):	573.353.0482
Fax Number:	573.659.0201

Each bidder shall also designate a specific contact person who will be responsible for responding to the State if any clarifications of the bidder's response should become necessary. This will also be the person who the State contacts to set up a presentation/demonstration, if required.

Communication with the State Contact Information	
Bidder Name:	Wipro LLC
Bidder Address:	2 Tower Center Blvd East Brunswick, NJ 08816
Contact Person & Title:	Thomas Stockdale, Business Development
E-mail Address:	Thomas.Stockdale@Wipro.com
Telephone Number (Office):	813.335.0084
Telephone Number (Cellular):	813.335.0084
Fax Number:	573,659.0201

I. TERMS AND CONDITIONS

By signing the "Request For Proposal For Contractual Services" form, the bidder guarantees compliance with the provisions stated in this Request for Proposal, agrees to the terms and conditions and certifies bidder maintains a drug free work place environment.

Bidders are expected to closely read the Terms and Conditions and provide a binding signature of intent to comply with the Terms and Conditions; provided, however, a bidder may indicate any exceptions to the Terms and Conditions by (1) clearly identifying the term or condition by subsection, (2) including an explanation for the bidder's inability to comply with such term or condition which includes a statement recommending terms and conditions the bidder would find acceptable. Rejection in whole or in part of the Terms and Conditions may be cause for rejection of a bidder's proposal.

A. GENERAL

 Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The contract resulting from this Request for Proposal shall incorporate the following documents:

1. Amendment to Contract Award with the most recent dated amendment having the highest priority;
2. Contract Award and any attached Addenda;
3. The signed Request for Proposal form and the Contractor's Proposal;
4. Amendments to RFP and any Questions and Answers; and
5. The original RFP document and any Addenda.

These documents constitute the entirety of the contract.

Unless otherwise specifically stated in a contract amendment, in case of any conflict between the incorporated documents, the documents shall govern in the following order of preference with number one (1) receiving preference over all other documents and with each lower numbered document having preference over any higher numbered document: 1) Amendment to Contract Award with the most recent dated amendment having the highest priority, 2) Contract Award and any attached Addenda, 3) the signed Request for Proposal form and the Contractor's Proposal, 4) Amendments to RFP and any Questions and Answers, 5) the original RFP document and any Addenda.

Any ambiguity in any provision of this contract which shall be discovered after its execution shall be resolved in accordance with the rules of contract interpretation as established in the State of Nebraska.

Once proposals are opened they become the property of the State of Nebraska and will not be returned.

B. AWARD

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

All purchases, leases, or contracts which are based on competitive proposals will be awarded according to the provisions in the Request for Proposal. The State reserves the right to reject any or all proposals, wholly or in part, or to award to multiple bidders in whole or in part, and at its discretion, may withdraw or amend the Request for Proposal at any time. The State reserves the right to waive any deviations or errors that are not material, do not invalidate the legitimacy of the proposal, and do not improve the bidder's competitive position. All awards will be made in a manner deemed in the best interest of the State. The Request for Proposal does not commit the State to award a contract. If, in the opinion of the State, revisions or amendments will require substantive changes in proposals, the due date may be extended.

By submitting a proposal in response to this Request for Proposal, the bidder grants to the State the right to contact or arrange a visit in person with any or all of the bidder's clients.

Once an intent to award decision has been determined, it will be posted to the Internet at: <http://www.das.state.ne.us/materiel/purchasing/rfp.htm>

Grievance and protest procedure is available on the Internet at: <http://www.das.state.ne.us/materiel/purchasing/agencyervicesprocurementmanual/ProtestGrievanceProcedureForServices.doc>

Any protests must be filed by a vendor within ten (10) calendar days after the intent to award decision is posted to the Internet.

C. COMPLIANCE WITH CIVIL RIGHTS LAWS AND EQUAL OPPORTUNITY EMPLOYMENT / NONDISCRIMINATION

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The contractor shall comply with all applicable local, State and Federal statutes and regulations regarding civil rights laws and equal opportunity employment. The Nebraska Fair Employment Practice Act prohibits contractors of the State of Nebraska, and their subcontractors, from discriminating against any employee or applicant for employment, with respect to hire, tenure, terms, conditions or privileges of employment because of race, color, religion, sex, disability, or national origin (Neb. Rev. Stat. §48-1101 to 48-1125). The contractor guarantees compliance with the Nebraska Fair Employment Practice Act, and breach of this provision shall be regarded as a material breach of contract. The contractor shall insert a similar provision in all subcontracts for services to be covered by any contract resulting from this Request for Proposal.

D. PERMITS, REGULATIONS, LAWS

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The contractor shall procure and pay for all permits, licenses and approvals necessary for the execution of the contract. The contractor shall comply with all applicable local, state, and federal laws, ordinances, rules, orders and regulations.

E. OWNERSHIP OF INFORMATION AND DATA

_____ Accept (Initial) _____ Reject (Initial) Reject and Provide Alternative within RFP Response (Initial)

The State of Nebraska shall have the unlimited right to publish, duplicate, use and disclose all information and data developed or derived by the contractor pursuant to this contract.

The contractor must guarantee that it has the full legal right to the materials, supplies, equipment, and other rights or titles (e.g. rights to licenses transfer or assign deliverables) necessary to execute this contract. The contract price shall, without exception, include compensation for all royalties and costs arising from patents, trademarks and copyrights that are in any way involved in the contract. It shall be the responsibility of the contractor to pay for all royalties and costs, and the State must be held harmless from any such claims.

F. INSURANCE REQUIREMENTS

_____ Accept (Initial) _____ Reject (Initial)  **Reject and Provide Alternative within RFP Response (Initial)**

The contractor shall not commence work under this contract until he or she has obtained all the insurance required hereunder and such insurance has been approved by the State. If contractor will be utilizing any subcontractors, the contractor is responsible for obtaining the certificate(s) of insurance required herein under from any and all subcontractor(s). Contractor is also responsible for ensuring subcontractor(s) maintain the insurance required until completion of the contract requirements. The contractor shall not allow any subcontractor to commence work on his or her subcontract until all similar insurance required of the subcontractor has been obtained and approved by the contractor. Approval of the insurance by the State shall not limit, relieve or decrease the liability of the contractor hereunder.

If by the terms of any insurance a mandatory deductible is required, or if the contractor elects to increase the mandatory deductible amount, the contractor shall be responsible for payment of the amount of the deductible in the event of a paid claim.

1. WORKERS' COMPENSATION INSURANCE

The contractor shall take out and maintain during the life of this contract the statutory Workers' Compensation and Employer's Liability Insurance for all of the contractors' employees to be engaged in work on the project under this contract and, in case any such work is sublet, the contractor shall require the subcontractor similarly to provide Worker's Compensation and Employer's Liability Insurance for all of the subcontractor's employees to be engaged in such work. This policy shall be written to meet the statutory requirements for the state in which the work is to be performed, including Occupational Disease. This policy shall include a waiver of subrogation in favor of the State. The amounts of such insurance shall not be less than the limits stated hereinafter.

2. COMMERCIAL GENERAL LIABILITY INSURANCE AND COMMERCIAL AUTOMOBILE LIABILITY INSURANCE

The contractor shall take out and maintain during the life of this contract such Commercial General Liability Insurance and Commercial Automobile Liability Insurance as shall protect contractor and any subcontractor performing work covered by this contract from claims for damages for bodily injury, including death, as well as from claims for property damage, which may arise from operations under this contract, whether such operation be by the contractor or by any subcontractor or by anyone directly or indirectly employed by either of them, and the amounts of such insurance shall not be less than limits stated hereinafter.

The Commercial General Liability Insurance shall be written on an occurrence basis, and provide Premises/Operations, Products/Completed Operations, Independent Contractors, Personal Injury and Contractual Liability coverage. The policy shall include the State, and others as required by the Contract Documents, as an Additional

Insured. This policy shall be primary, and any insurance or self-insurance carried by the State shall be considered excess and non-contributory. The Commercial Automobile Liability Insurance shall be written to cover all Owned, Non-owned and Hired vehicles.

3. INSURANCE COVERAGE AMOUNTS REQUIRED

a. WORKERS' COMPENSATION AND EMPLOYER'S LIABILITY

Coverage A	Statutory
Coverage B	
Bodily Injury by Accident	\$100,000 each accident
Bodily Injury by Disease	\$500,000 policy limit
Bodily Injury by Disease	\$100,000 each employee

b. COMMERCIAL GENERAL LIABILITY

General Aggregate	\$2,000,000
Products/Completed Operations Aggregate	\$2,000,000
Personal/Advertising Injury	\$1,000,000 any one person
Bodily Injury/Property Damage	\$1,000,000 per occurrence
Fire Damage	\$50,000 any one fire
Medical Payments	\$5,000 any one person

c. COMMERCIAL AUTOMOBILE LIABILITY

Bodily Injury/Property Damage	\$1,000,000 combined single limit
-------------------------------	-----------------------------------

d. UMBRELLA/EXCESS LIABILITY

Over Primary Insurance	\$1,000,000 per occurrence
------------------------	----------------------------

4. EVIDENCE OF COVERAGE

The contractor should furnish the State, with their proposal response, a certificate of insurance coverage complying with the above requirements to the attention of Buyer Name, Administrative Services, State Purchasing Bureau, 1526 K Street, Suite 130, Lincoln, NE 68508 (facsimile 402-471-2089). These certificates or the cover sheet shall reference the RFP number, and the certificates shall include the name of the company, policy numbers, effective dates, dates of expiration and amounts and types of coverage afforded. If the State is damaged by the failure of the contractor to maintain such insurance, then the contractor shall be responsible for all reasonable costs properly attributable thereto.

Notice of cancellation of any required insurance policy must be submitted to Buyer Name, Administrative Services State Purchasing Bureau when issued and a new coverage binder shall be submitted immediately to ensure no break in coverage.

G. COOPERATION WITH OTHER CONTRACTORS

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The State may already have in place or choose to award supplemental contracts for work related to this Request for Proposal, or any portion thereof.

1. The State reserves the right to award the contract jointly between two or more potential contractors, if such an arrangement is in the best interest of the State.
2. The contractor shall agree to cooperate with such other contractors, and shall not commit or permit any act which may interfere with the performance of work by any other contractor.

H. INDEPENDENT CONTRACTOR

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

It is agreed that nothing contained herein is intended or should be construed in any manner as creating or establishing the relationship of partners between the parties hereto. The contractor represents that it has, or will secure at its own expense, all personnel required to perform the services under the contract. The contractor's employees and other persons engaged in work or services required by the contractor under the contract shall have no contractual relationship with the State; they shall not be considered employees of the State.

All claims on behalf of any person arising out of employment or alleged employment (including without limit claims of discrimination against the contractor, its officers or its agents) shall in no way be the responsibility of the State. The contractor will hold the State harmless from any and all such claims. Such personnel or other persons shall not require nor be entitled to any compensation, rights or benefits from the State including without limit, tenure rights, medical and hospital care, sick and vacation leave, severance pay or retirement benefits.

I. CONTRACTOR RESPONSIBILITY

_____ Accept (Initial) _____ Reject (Initial) Reject and Provide Alternative within RFP Response (Initial)

The contractor is solely responsible for fulfilling the contract, with responsibility for all services offered and products to be delivered as stated in the Request for Proposal, the contractor's proposal, and the resulting contract. The contractor shall be the sole point of contact regarding all contractual matters.

If the contractor intends to utilize any subcontractors' services, the subcontractors' level of effort, tasks and time allocation must be clearly defined in the contractor's proposal. The contractor shall agree that it will not utilize any subcontractors not specifically included in its proposal, in the performance of the contract, without the prior written authorization of the State. Following execution of the contract, the contractor shall proceed diligently with all services and shall perform such services with qualified personnel in accordance with the contract.

J. CONTRACTOR PERSONNEL

Accept (Initial) _____ Reject (Initial) _____ **Reject and Provide Alternative within RFP Response (Initial)**

The contractor warrants that all persons assigned to the project shall be employees of the contractor or specified subcontractors, and shall be fully qualified to perform the work required herein. Personnel employed by the contractor to fulfill the terms of the contract shall remain under the sole direction and control of the contractor. The contractor shall include a similar provision in any contract with any subcontractor selected to perform work on the project.

Personnel commitments made in the contractor's proposal shall not be changed without the prior written approval of the State. Replacement of key personnel, if approved by the State, shall be with personnel of equal or greater ability and qualifications.

The State reserves the right to require the contractor to reassign or remove from the project any contractor or subcontractor employee.

In respect to its employees, the contractor agrees to be responsible for the following:

1. any and all employment taxes and/or other payroll withholding;
2. any and all vehicles used by the contractor's employees, including all insurance required by state law;
3. damages incurred by contractor's employees within the scope of their duties under the contract;
4. maintaining workers' compensation and health insurance and submitting any reports on such insurance to the extent required by governing State law; and
5. determining the hours to be worked and the duties to be performed by the contractor's employees.

Notice of cancellation of any required insurance policy must be submitted to the State when issued and a new coverage binder shall be submitted immediately to ensure no break in coverage.

K. STATE OF NEBRASKA PERSONNEL RECRUITMENT PROHIBITION

_____ Accept (Initial) _____ Reject (Initial) **Reject and Provide Alternative within RFP Response (Initial)**

The contractor shall not, at any time, recruit or employ any State employee or agent who has worked on the Request for Proposal or project, or who had any influence on decisions affecting the Request for Proposal or project.

L. CONFLICT OF INTEREST

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

By submitting a proposal, bidder certifies that there does not now exist any relationship between the bidder and any person or entity which is or gives the appearance of a conflict of interest related to this Request for Proposal or project.

The bidder certifies that it shall not take any action or acquire any interest, either directly or indirectly, which will conflict in any manner or degree with the performance of its services hereunder or which creates an actual or appearance of conflict of interest.

The bidder certifies that it will not employ any individual known by bidder to have a conflict of interest.

M. PROPOSAL PREPARATION COSTS

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The State shall not incur any liability for any costs incurred by bidders in replying to this Request for Proposal, in the demonstrations, or oral presentations, or in any other activity related to bidding on this Request for Proposal.

N. ERRORS AND OMISSIONS

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The bidder shall not take advantage of any errors and/or omissions in this Request for Proposal or resulting contract. The bidder must promptly notify the State of any errors and/or omissions that are discovered.

O. BEGINNING OF WORK

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The bidder shall not commence any billable work until a valid contract has been fully executed by the State and the successful contractor. The contractor will be notified in writing when work may begin.

P. ASSIGNMENT BY THE STATE

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The State shall have the right to assign or transfer the contract or any of its interests herein to any agency, board, commission, or political subdivision of the State of Nebraska. There shall be no charge to the State for any assignment hereunder.

Q. ASSIGNMENT BY THE CONTRACTOR

Accept (Initial) Reject (Initial) **Reject and Provide Alternative within RFP Response (Initial)**

The contractor may not assign, voluntarily or involuntarily, the contract or any of its rights or obligations hereunder (including without limitation rights and duties of performance) to any third party, without the prior written consent of the State, which will not be unreasonably withheld.

R. DEVIATIONS FROM THE REQUEST FOR PROPOSAL

Accept (Initial) Reject (Initial) Reject and Provide Alternative within RFP Response (Initial)

The requirements contained in the Request for Proposal become a part of the terms and conditions of the contract resulting from this Request for Proposal. Any deviations from the Request for Proposal must be clearly defined by the bidder in its proposal and, if accepted by the State, will become part of the contract. Any specifically defined deviations must not be in conflict with the basic nature of the Request for Proposal or mandatory requirements. "Deviation", for the purposes of this RFP, means any proposed changes or alterations to either the contractual language or deliverables within the scope of this RFP. The State discourages deviations and reserves the right to reject proposed deviations.

S. GOVERNING LAW

Accept (Initial) Reject (Initial) Reject and Provide Alternative within RFP Response (Initial)

The contract shall be governed in all respects by the laws and statutes of the State of Nebraska. Any legal proceedings against the State of Nebraska regarding this Request for Proposal or any resultant contract shall be brought in the State of Nebraska administrative or judicial forums as defined by State law. The contractor must be in compliance with all Nebraska statutory and regulatory law.

T. ATTORNEY'S FEES

Accept (Initial) Reject (Initial) **Reject and Provide Alternative within RFP Response (Initial)**

In the event of any litigation, appeal or other legal action to enforce any provision of the contract, the contractor agrees to pay all expenses of such action, as permitted by law, including attorney's fees and costs, if the State is the prevailing party.

U. ADVERTISING

Accept (Initial) Reject (Initial) Reject and Provide Alternative within RFP Response (Initial)

The contractor agrees not to refer to the contract award in advertising in such a manner as to state or imply that the company or its services are endorsed or preferred by the State. News releases pertaining to the project shall not be issued without prior written approval from the State.

V. STATE PROPERTY

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The contractor shall be responsible for the proper care and custody of any State-owned property which is furnished for the contractor's use during the performance of the contract. The contractor shall reimburse the State for any loss or damage of such property, normal wear and tear is expected.

W. SITE RULES AND REGULATIONS

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The contractor shall use its best efforts to ensure that its employees, agents and subcontractors comply with site rules and regulations while on State premises. If the contractor must perform on-site work outside of the daily operational hours set forth by the State, it must make arrangements with the State to ensure access to the facility and the equipment has been arranged. No additional payment will be made by the State on the basis of lack of access, unless the State fails to provide access as agreed to between the State and the contractor.

X. NOTIFICATION

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

During the bid process, all communication between the State and a bidder shall be between the bidder's representative clearly noted in its proposal and the buyer noted in Section II, A. Procuring Office and Contact Person of this RFP. After the award of the contract, all notices under the contract shall be deemed duly given upon delivery to the staff designated as the point of contact for this Request for Proposal, in person, or upon delivery by U.S. Mail, facsimile, or e-mail. Each bidder should provide in its proposal the name, title and complete address of its designee to receive notices.

1. Except as otherwise expressly specified herein, all notices, requests or other communications shall be in writing and shall be deemed to have been given if delivered personally or mailed, by U.S. Mail, postage prepaid, return receipt requested, to the parties at their respective addresses set forth above, or at such other addresses as may be specified in writing by either of the parties. All notices, requests, or communications shall be deemed effective upon personal delivery or three (3) days following deposit in the mail.
2. Whenever the contractor encounters any difficulty which is delaying or threatens to delay its timely performance under the contract, the contractor shall immediately give notice thereof in writing to the State reciting all relevant information with respect thereto. Such notice shall not in any way constitute a basis for an extension of the delivery schedule or be construed as a waiver by the State of any of its rights or remedies to which it is entitled by law or equity or pursuant to the provisions of the contract. Failure to give such notice, however, may be grounds for denial of any request for an extension of the delivery schedule because of such delay.

Either party may change its address for notification purposes by giving notice of the change, and setting forth the new address and an effective date.

For the duration of the contract, all communication between contractor and the State regarding the contract shall take place between the contractor and individuals specified by the State in writing. Communication about the contract between contractor and individuals not designated as points of contact by the State is strictly forbidden.

Y. EARLY TERMINATION

Accept (Initial) _____ **Reject (Initial)** _____ **Reject and Provide Alternative within RFP Response (Initial)**

The contract may be terminated as follows:

1. The State and the contractor, by mutual written agreement, may terminate the contract at any time.
2. The State, in its sole discretion, may terminate the contract for any reason upon 30 days written notice to the contractor. Such termination shall not relieve the contractor of warranty or other service obligations incurred under the terms of the contract. In the event of cancellation the contractor shall be entitled to payment, determined on a pro rata basis, for products or services satisfactorily performed or provided.
3. The State may terminate the contract immediately for the following reasons:
 - a. if directed to do so by statute;
 - b. contractor has made an assignment for the benefit of creditors, has admitted in writing its inability to pay debts as they mature, or has ceased operating in the normal course of business;
 - c. a trustee or receiver of the contractor or of any substantial part of the contractor's assets has been appointed by a court;
 - d. fraud, misappropriation, embezzlement, malfeasance, misfeasance, or illegal conduct pertaining to performance under the contract by its contractor, its employees, officers, directors or shareholders;
 - e. an involuntary proceeding has been commenced by any party against the contractor under any one of the chapters of Title 11 of the United States Code and (i) the proceeding has been pending for at least sixty (60) days; or (ii) the contractor has consented, either expressly or by operation of law, to the entry of an order for relief; or (iii) the contractor has been decreed or adjudged a debtor;
 - f. a voluntary petition has been filed by the contractor under any of the chapters of Title 11 of the United States Code;
 - g. contractor intentionally discloses confidential information;
 - h. contractor has or announces it will discontinue support of the deliverable;
 - i. second or subsequent documented "vendor performance report" form deemed acceptable by the State Purchasing Bureau.

Z. FUNDING OUT CLAUSE OR LOSS OF APPROPRIATIONS

Accept (Initial) _____ **Reject (Initial)** _____ **Reject and Provide Alternative within RFP Response (Initial)**

The State may terminate the contract, in whole or in part, in the event funding is no longer available. The State's obligation to pay amounts due for fiscal years following the current fiscal year is contingent upon legislative appropriation of funds for the contract. Should said funds not be appropriated, the State may terminate the contract with respect to those payments for the fiscal years for which such funds are not appropriated. The State will give the contractor written notice thirty (30) days prior to the effective date of any termination, and advise the contractor of the location (address and room number) of any related equipment. All obligations of the State to make payments after the termination date will cease and all interest of the State in any related equipment will terminate. The contractor shall be entitled to receive just and equitable compensation for any authorized work which has been satisfactorily completed as of the termination date. In no event shall the contractor be paid for a loss of anticipated profit.

AA. BREACH BY CONTRACTOR

_____ Accept (Initial) _____ Reject (Initial)  **Reject and Provide Alternative within RFP Response (Initial)**

The State may terminate the contract, in whole or in part, if the contractor fails to perform its obligations under the contract in a timely and proper manner. The State may, by providing a written notice of default to the contractor, allow the contractor to cure a failure or breach of contract within a period of thirty (30) days (or longer at State's discretion considering the gravity and nature of the default). Said notice shall be delivered by Certified Mail, Return Receipt Requested or in person with proof of delivery. Allowing the contractor time to cure a failure or breach of contract does not waive the State's right to immediately terminate the contract for the same or different contract breach which may occur at a different time. In case of default of the contractor, the State may contract the service from other sources and hold the contractor responsible for any excess cost occasioned thereby.

BB. ASSURANCES BEFORE BREACH

 _____ Accept (Initial) _____ Reject (Initial) _____ **Reject and Provide Alternative within RFP Response (Initial)**

If any document or deliverable required pursuant to the contract does not fulfill the requirements of the Request for Proposal/resulting contract, upon written notice from the State, the contractor shall deliver assurances in the form of additional contractor resources at no additional cost to the project in order to complete the deliverable, and to ensure that other project schedules will not be adversely affected.

CC. PENALTY

_____ Accept (Initial) _____ Reject (Initial)  **Reject and Provide Alternative within RFP Response (Initial)**

In the event that the contractor fails to perform any substantial obligation under the contract, the State may withhold all monies due and payable to the contractor, without penalty, until such failure is cured or otherwise adjudicated. Failure to meet the dates stipulated in the contract for the deliverables may result in an assessment of penalty due the State of \$1,000 dollars per day, until the deliverables are approved. Contractor will be notified in writing when penalty will commence.

DD. PERFORMANCE BOND

_____ Accept (Initial) _____ Reject (Initial) **Reject and Provide Alternative within RFP Response (Initial)**

The selected contractor will be required to supply a certified check or a bond executed by a corporation authorized to contract surety in the State of Nebraska, payable to the State of Nebraska, which shall be valid for the life of the contract to include any renewal and/or extension periods. The amount of the certified check or bond must be the dollar amount of \$15,000,000.00. The check or bond will guarantee that the selected contractor will faithfully perform all requirements, terms and conditions of the contract. Failure to comply shall be grounds for forfeiture of the check or bond as liquidated damages. Amount of forfeiture will be determined by the agency based on loss to the State. The bond or certified check will be returned when the service has been satisfactorily completed as solely determined by the State, after termination or expiration of the contract.

EE. FORCE MAJEURE

Accept (Initial) _____ Reject (Initial) _____ **Reject and Provide Alternative within RFP Response (Initial)**

Neither party shall be liable for any costs or damages resulting from its inability to perform any of its obligations under the contract due to a natural disaster, or other similar event outside the control and not the fault of the affected party ("Force Majeure Event"). A Force Majeure Event shall not constitute a breach of the contract. The party so affected shall immediately give notice to the other party of the Force Majeure Event. The State may grant relief from performance of the contract if the contractor is prevented from performance by a Force Majeure Event. The burden of proof for the need for such relief shall rest upon the contractor. To obtain release based on a Force Majeure Event, the contractor shall file a written request for such relief with the State Purchasing Bureau. Labor disputes with the impacted party's own employees will not be considered a Force Majeure Event and will not suspend performance requirements under the contract.

FF. PROHIBITION AGAINST ADVANCE PAYMENT

_____ Accept (Initial) _____ Reject (Initial) **Reject and Provide Alternative within RFP Response (Initial)**

Payments shall not be made until contractual deliverable(s) are received and accepted by the State.

GG. PAYMENT

_____ Accept (Initial) _____ Reject (Initial) **Reject and Provide Alternative within RFP Response (Initial)**

State will render payment to contractor when the terms and conditions of the contract and specifications have been satisfactorily completed on the part of the contractor as solely determined by the State. Payment will be made by the responsible agency in compliance with the State of Nebraska Prompt Payment Act (See Neb. Rev. Stat. §81-2401 through 81-2408). The State may require the contractor to accept payment by electronic means such as ACH deposit. In no event shall the State be responsible or

liable to pay for any services provided by the contractor prior to the Effective Date, and the contractor hereby waives any claim or cause of action for any such services.

HH. INVOICES

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

Invoices for payments must be submitted by the contractor to the agency requesting the services with sufficient detail to support payment. Invoices must be submitted to: Medicaid and Long-Term Care Division, P.O. Box 95026, Lincoln, NE 68509. The terms and conditions included in the contractor's invoice shall be deemed to be solely for the convenience of the parties. No terms or conditions of any such invoice shall be binding upon the State, and no action by the State, including without limitation the payment of any such invoice in whole or in part, shall be construed as binding or estopping the State with respect to any such term or condition, unless the invoice term or condition has been previously agreed to by the State as an amendment to the contract.

II. AUDIT REQUIREMENTS

_____ Accept (Initial) _____ Reject (Initial) Reject and Provide Alternative within RFP Response (Initial)

All contractor books, records and documents relating to work performed or monies received under the contract shall be subject to audit at any reasonable time upon the provision of reasonable notice by the State. These records shall be maintained for a period of five (5) full years from the date of final payment, or until all issues related to an audit, litigation or other action are resolved, whichever is longer. All records shall be maintained in accordance with generally accepted accounting principles.

In addition to, and in no way in limitation of any obligation in the contract, the contractor shall agree that it will be held liable for any State audit exceptions, and shall return to the State all payments made under the contract for which an exception has been taken or which has been disallowed because of such an exception. The contractor agrees to correct immediately any material weakness or condition reported to the State in the course of an audit.

JJ. TAXES

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The State is not required to pay taxes of any kind and assumes no such liability as a result of this solicitation. Any property tax payable on the contractor's equipment which may be installed in a state-owned facility is the responsibility of the contractor.

KK. INSPECTION AND APPROVAL

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

Final inspection and approval of all work required under the contract shall be performed by the designated State officials. The State and/or its authorized representatives shall have the right to enter any premises where the contractor or subcontractor duties under the contract are being performed, and to inspect, monitor or otherwise evaluate the work being performed. All inspections and evaluations shall be at reasonable times and in a manner that will not unreasonably delay work.

LL. CHANGES IN SCOPE/CHANGE ORDERS

_____ Accept (Initial) _____ Reject (Initial) ~~_____~~ **Reject and Provide Alternative within RFP Response (Initial)**

The State may, at any time with written notice to the contractor, make changes within the general scope of the contract. Changes in scope shall only be conducted with the written approval of the State's designee as so defined by the State from time to time. (The State retains the right to employ the services of a third party to perform any change order(s)).

The State may, at any time work is in progress, by written order, make alterations in the terms of work as shown in the specifications, require the performance of extra work, decrease the quantity of work, or make such other changes as the State may find necessary or desirable. The contractor shall not claim forfeiture of contract by reasons of such changes by the State. Changes in work and the amount of compensation to be paid to the contractor for any extra work so ordered shall be determined in accordance with the applicable unit prices of the contractor's proposal.

Corrections of any deliverable services or performance of work required pursuant to the contract shall not be deemed a modification requiring a change order.

MM. SEVERABILITY

~~_____~~ **Accept (Initial)** _____ Reject (Initial) _____ **Reject and Provide Alternative within RFP Response (Initial)**

If any term or condition of the contract is declared by a court of competent jurisdiction to be illegal or in conflict with any law, the validity of the remaining terms and conditions shall not be affected, and the rights and obligations of the parties shall be construed and enforced as if the contract did not contain the particular provision held to be invalid.

NN. CONFIDENTIALITY

~~_____~~ **Accept (Initial)** _____ Reject (Initial) _____ **Reject and Provide Alternative within RFP Response (Initial)**

All materials and information provided by the State or acquired by the contractor on behalf of the State shall be regarded as confidential information. All materials and information provided by the State or acquired by the contractor on behalf of the State shall be handled in accordance with Federal and State Law, and ethical standards. The contractor must ensure the confidentiality of such materials or information. Should said confidentiality be breached by a contractor; contractor shall notify the State immediately of said breach and take immediate corrective action.

It is incumbent upon the contractor to inform its officers and employees of the penalties for improper disclosure imposed by the Privacy Act of 1974, 5 U.S.C. 552a. Specifically, 5 U.S.C. 552a (i)(1), which is made applicable to contractors by 5 U.S.C. 552a (m)(1), provides that any officer or employee of a contractor, who by virtue of his/her employment or official position has possession of or access to agency records which contain individually identifiable information, the disclosure of which is prohibited by the Privacy Act or regulations established thereunder, and who knowing that disclosure of the specific material is prohibited, willfully discloses the material in any manner to any person or agency not entitled to receive it, shall be guilty of a misdemeanor and fined not more than \$5,000.

OO. PROPRIETARY INFORMATION

 **Accept (Initial)** _____ **Reject (Initial)** _____ **Reject and Provide Alternative within RFP Response (Initial)**

Data contained in the proposal and all documentation provided therein, become the property of the State of Nebraska and the data becomes public information upon opening the proposal. If the bidder wishes to have any information withheld from the public, such information must fall within the definition of proprietary information contained within Nebraska's public record statutes. All proprietary information the bidder wishes the State to withhold must be submitted in a sealed package, which is separate from the remainder of the proposal. The separate package must be clearly marked PROPRIETARY on the outside of the package. Bidders may not mark their entire Request for Proposal as proprietary. Bidder's cost proposals may not be marked as proprietary information. Failure of the bidder to follow the instructions for submitting proprietary and copyrighted information may result in the information being viewed by other bidders and the public. Proprietary information is defined as trade secrets, academic and scientific research work which is in progress and unpublished, and other information which if released would give advantage to business competitors and serve no public purpose (see Neb. Rev. Stat. §84-712.05(3)). In accordance with Attorney General Opinions 92068 and 97033, bidders submitting information as proprietary may be required to prove specific, named competitor(s) who would be advantaged by release of the information and the specific advantage the competitor(s) would receive. Although every effort will be made to withhold information that is properly submitted as proprietary and meets the State's definition of proprietary information, the State is under no obligation to maintain the confidentiality of proprietary information and accepts no liability for the release of such information.

PP. CERTIFICATION OF INDEPENDENT PRICE DETERMINATION/COLLUSIVE BIDDING

 **Accept (Initial)** _____ **Reject (Initial)** _____ **Reject and Provide Alternative within RFP Response (Initial)**

By submission of this proposal, the bidder certifies, that he or she is the party making the foregoing proposal that the proposal is not made in the interest of, or on behalf of, any undisclosed person, partnership, company, association, organization, or corporation; that the proposal is genuine and not collusive or sham; that the bidder has not directly or indirectly induced or solicited any other bidder to put in a false or sham proposal, and has not directly or indirectly colluded, conspired, connived, or agreed with any bidder or anyone else to put in a sham proposal, or that anyone shall refrain from bidding; that the bidder has not in any manner, directly or indirectly, sought by agreement, communication, or conference with anyone to fix the proposal price of the bidder or any other bidder, or to fix any overhead, profit, or cost element of the proposal price, or of that of any other bidder, or to secure any advantage against the public body awarding the contract of anyone interested in the proposed contract; that all statements contained in the proposal are true; and further that the bidder has not, directly or indirectly, submitted his or her proposal price or any breakdown thereof, or the contents thereof, or divulged information or data relative thereto, or paid, and will not pay, any fee to any corporation, partnership, company association, organization, proposal depository, or to any member or agent thereof to effectuate a collusive or sham proposal.

QQ. PRICES

Accept (Initial) Reject (Initial) Reject and Provide Alternative within RFP Response (Initial)

All prices, costs, terms and conditions outlined in the proposal shall remain fixed and valid commencing on the opening date of the proposal until an award is made (and for bidder receiving award prices shall remain as bid for the duration of the contract unless otherwise so stated in the contract) or the Request for Proposal is cancelled.

Contractor represents and warrants that all prices for services, now or subsequently specified are as low as and no higher than prices which the contractor has charged or intends to charge customers other than the State for the same or similar products and services of the same or equivalent quantity and quality for delivery or performance during the same periods of time. If, during the term of the contract, the contractor shall reduce any and/or all prices charged to any customers other than the State for the same or similar products or services specified herein, the contractor shall make an equal or equivalent reduction in corresponding prices for said specified products or services.

Contractor also represents and warrants that all prices set forth in the contract and all prices in addition, which the contractor may charge under the terms of the contract, do not and will not violate any existing federal, state or municipal law or regulations concerning price discrimination and/or price fixing. Contractor agrees to hold the State harmless from any such violation. Prices quoted shall not be subject to increase throughout the contract period unless specifically allowed by these specifications.

RR. BEST AND FINAL OFFER

Accept (Initial) Reject (Initial) Reject and Provide Alternative within RFP Response (Initial)

The State will compile the final scores for all parts of each proposal. The award may be granted to the highest scoring responsive and responsible bidder. Alternatively, the highest scoring bidder or bidders may be requested to submit best and final offers. If best and final offers are requested by the State and submitted by the bidder, they will be evaluated (using the stated criteria), scored and ranked by the Evaluation Committee. The award will then be granted to the highest scoring bidder. However, a bidder should provide its best offer in its original proposal. Bidders should not expect that the State will request a best and final offer.

SS. ETHICS IN PUBLIC CONTRACTING

Accept (Initial) Reject (Initial) Reject and Provide Alternative within RFP Response (Initial)

No bidder shall pay or offer to pay, either directly or indirectly, any fee, commission compensation, gift, gratuity, or anything of value to any State officer, legislator or employee based on the understanding that the receiving person's vote, actions or judgment will be influenced thereby. No bidder shall give any item of value to any employee of the State Purchasing Bureau.

Bidders shall be prohibited from utilizing the services of lobbyists, attorneys, political activists, or consultants to secure the contract. It is the intent of this provision to assure that the prohibition of state contact during the procurement process is not subverted through the use of lobbyists, attorneys, political activists, or consultants. It is the intent of

the State that the process of evaluation of proposals and award of the contract be completed without external influence. It is not the intent of this section to prohibit bidders from seeking professional advice, for example consulting legal counsel, regarding terms and conditions of this Request for Proposal or the format or content of their proposal.

If the bidder is found to be in non-compliance with this section of the Request for Proposal, they may forfeit the contract if awarded to them or be disqualified from the selection process.

TT. INDEMNIFICATION

_____ Accept (Initial) _____ Reject (Initial)  **Reject and Provide Alternative within RFP Response (Initial)**

1. GENERAL

The contractor agrees to defend, indemnify, hold, and save harmless the State and its employees, volunteers, agents, and its elected and appointed officials (“the indemnified parties”) from and against any and all claims, liens, demands, damages, liability, actions, causes of action, losses, judgments, costs, and expenses of every nature, including investigation costs and expenses, settlement costs, and attorney fees and expenses (“the claims”), sustained or asserted against the State, arising out of, resulting from, or attributable to the willful misconduct, negligence, error, or omission of the contractor, its employees, subcontractors, consultants, representatives, and agents, except to the extent such contractor liability is attenuated by any action of the State which directly and proximately contributed to the claims.

2. INTELLECTUAL PROPERTY

The contractor agrees it will at its sole cost and expense, defend, indemnify, and hold harmless the indemnified parties from and against any and all claims, to the extent such claims arise out of, result from, or are attributable to the actual or alleged infringement or misappropriation of any patent, copyright, trade secret, trademark, or confidential information of any third party by the contractor or its employees, subcontractors, consultants, representatives, and agents; provided, however, the State gives the contractor prompt notice in writing of the claim. The contractor may not settle any infringement claim that will affect the State’s use of the Licensed Software without the State’s prior written consent, which consent may be withheld for any reason.

If a judgment or settlement is obtained or reasonably anticipated against the State’s use of any intellectual property for which the contractor has indemnified the State, the contractor shall at the contractor’s sole cost and expense promptly modify the item or items which were determined to be infringing, acquire a license or licenses on the State’s behalf to provide the necessary rights to the State to eliminate the infringement, or provide the State with a non-infringing substitute that provides the State the same functionality. At the State’s election, the actual or anticipated judgment may be treated as a breach of warranty by the contractor, and the State may receive the remedies provided under this RFP.

3. PERSONNEL

The contractor shall, at its expense, indemnify and hold harmless the indemnified parties from and against any claim with respect to withholding taxes, worker’s

compensation, employee benefits, or any other claim, demand, liability, damage, or loss of any nature relating to any of the personnel provided by the contractor.

UU. NEBRASKA TECHNOLOGY ACCESS STANDARDS

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

Contractor shall review the Nebraska Technology Access Standards, found at <http://nitc.nebraska.gov/standards/2-101.html> and ensure that products and/or services provided under the contract comply with the applicable standards. In the event such standards change during the contractor's performance, the State may create an amendment to the contract to request that contract comply with the changed standard at a cost mutually acceptable to the parties.

VV. ANTITRUST

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The contractor hereby assigns to the State any and all claims for overcharges as to goods and/or services provided in connection with this contract resulting from antitrust violations which arise under antitrust laws of the United States and the antitrust laws of the State.

WW. DISASTER RECOVERY/BACK UP PLAN

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The contractor shall have a disaster recovery and back-up plan, of which a copy should be provided to the State, which includes, but is not limited to equipment, personnel, facilities, and transportation, in order to continue services as specified under these specifications in the event of a disaster.

XX. TIME IS OF THE ESSENCE

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

Time is of the essence in this contract. The acceptance of late performance with or without objection or reservation by the State shall not waive any rights of the State nor constitute a waiver of the requirement of timely performance of any obligations on the part of the contractor remaining to be performed.

YY. RECYCLING

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

Preference will be given to items which are manufactured or produced from recycled material or which can be readily reused or recycled after their normal use as per state statute (Neb. Rev. Stat. §81-15, 159).

ZZ. DRUG POLICY

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

Contractor certifies it maintains a drug free work place environment to ensure worker safety and workplace integrity. Contractor agrees to provide a copy of its drug free workplace policy at any time upon request by the State.

AAA. EMPLOYEE WORK ELIGIBILITY STATUS

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The Contractor is required and hereby agrees to use a federal immigration verification system to determine the work eligibility status of employees physically performing services within the State of Nebraska. A federal immigration verification system means the electronic verification of the work authorization program authorized by the Illegal Immigration Reform and Immigrant Responsibility Act of 1996, 8 U.S.C. 1324a, known as the E-Verify Program, or an equivalent federal program designated by the United States Department of Homeland Security or other federal agency authorized to verify the work eligibility status of a hired employee.

If the Contractor is an individual or sole proprietorship, the following applies:

1. The Contractor must complete the United States Citizenship Attestation Form, available on the Department of Administrative Services website at www.das.state.ne.us.
2. If the Contractor indicates on such attestation form that he or she is a qualified alien, the Contractor agrees to provide the US Citizenship and Immigration Services documentation required to verify the Contractor's lawful presence in the United States using the Systematic Alien Verification for Entitlements (SAVE) Program.
3. The Contractor understands and agrees that lawful presence in the United States is required and the Contractor may be disqualified or the contract terminated if such lawful presence cannot be verified as required by Neb. Rev. Stat. §4-108.

BBB. CERTIFICATION REGARDING DEBARMENT, SUSPENSION AND INELIGIBILITY

Accept (Initial) _____ Reject (Initial) _____ Reject and Provide Alternative within RFP Response (Initial)

The contractor, by signature to this RFP, certifies that the contractor is not presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded by any federal department or agency from participating in transactions (debarred). The contractor also agrees to include the above requirements in any and all subcontracts into which it enters. The contractor shall immediately notify the State of Nebraska if, during the term of this contract, contractor becomes debarred. The State of Nebraska may immediately terminate this contract by providing contractor written notice if contractor becomes debarred during the term of this contract.

State of Nebraska RFP
Alternative proposals for Part III - Terms and Conditions

1. Section E – Wipro requests some modification to the clause, so as to have protection for pre-existing Intellectual Property Rights of Wipro:

*The State of Nebraska shall have the unlimited right to publish, duplicate, use and disclose all information and data developed or derived by the contractor **specifically for the State of Nebraska as a deliverable** pursuant to this contract*

Retained Rights. Each Party owns, and will continue to own all right, title and interest in and to any inventions however embodied, know how, works in any media, software, information, trade secrets, materials, property or proprietary interest, that it owned prior to this Agreement, or that it created or acquired independently of its obligations pursuant to this Agreement, and in respect of any modifications or enhancements made thereto (collectively, “Retained Rights”). All Retained Rights not expressly transferred or licensed herein are reserved to the respective owner.

2. Section F – While Wipro is generally in agreement with all insurance requirements under this section, Wipro would like to remove the requirement for Commercial Automobile Liability Insurance, since such insurance is not relevant to the scope of services under this RFP.
3. Section I – While Wipro is in agreement with the Section, Wipro requests an addition of the below provision to the Section, to provide for circumstances where Wipro is prevented or delayed from performance of Wipro’s obligations due to a failure or delay on the part of the State:

The Contractor’s failure to perform or delay in performing its contractual responsibilities (in whole or in part), to perform any part of the Services (whether in conformance with the Contract or at all), or to meet any agreed service levels shall be excused if and to the extent the Contractor’s non-performance is contributed to by the State’s act or omission to act, delay, wrongful action, failure to provide inputs or approvals, or failure to perform its obligations under the Contract. The State shall in this regard also be responsible for the acts and omissions of its officers and other suppliers and contractors.

4. Section K – While Wipro is in agreement with the Section, Wipro requests an addition of the below provision to the Section to make the obligations under Section K mutual, as Wipro, being a service provider, is dependent on it’s personnel and would like to protect against it’s personnel being hired away to avoid any impact to the services and to Wipro as a whole:

The State agrees that for the term of this Contract and for a period of one (1) year thereafter, the State will not directly or indirectly, recruit, solicit, discuss employment with, hire, employ or engage any of the Contractor’s personnel then assigned to provide any aspect of the Services to the State or who were so assigned within the previous one (1) year period, or induce any such individual to leave the employ of the Contractor.

5. Section Q - While Wipro is in agreement with the Section, Wipro requests an addition of the below provision to the Section to permit Wipro to assign its receivables under the contract to a financial institution in order to make working capital arrangements. Such assignment would only be to the extent of the receivables to Wipro under the Contract and will not

affect any of the obligations and terms of the Contract, which would remain Wipro's responsibility and the State would have all the rights under the Contract to enforce the same against Wipro:

The Contractor may assign the benefit of its rights of payment to a third party as part of its debt factoring or other legitimate business arrangements. Such assignment shall not affect any of the Contractor's responsibilities under the Contract which shall continue unabated.

6. Section T – Wipro requests making this section mutually applicable, with the below modifications:

*In the event of any litigation, appeal or other legal action to enforce any provision of the contract, the contractor agrees to pay all expenses of such action, as permitted by law, including attorney's fees and costs, if the State is the prevailing party. **Similarly, in the event of any litigation, appeal or other legal action to enforce any provision of the contract, the State agrees to pay all expenses of such action, as permitted by law, including attorney's fees and costs, if the Contractor is the prevailing party.***

7. Section AA – Wipro requests the below modifications to the Section, so as to provide some equitable protection to Wipro in the stated circumstances:

*The State may terminate the contract, in whole or in part, if the contractor fails to perform its obligations under the contract in a timely and proper manner. The State ~~may~~ will, by providing a written notice of default to the contractor, allow the contractor to cure a failure or breach of contract within a period of thirty (30) days (or longer at State's discretion considering the gravity and nature of the default) **prior to the effective date of termination. The contractor may, by providing a written notice of default to the State with an opportunity to cure within a period of forty five (45) days, terminate the contract in the event of non-payment of undisputed due charges to the contractor by the State.** (Said notice shall be delivered by Certified Mail, Return Receipt Requested or in person with proof of delivery. Allowing the contractor time to cure a failure or breach of contract does not waive the State's right to immediately terminate the contract for the same or different contract breach which may occur at a different time. In case of default of the contractor, the State may contract the service from other sources and hold the contractor responsible for any excess cost occasioned thereby, **subject to a maximum amount of the value of the milestones which were not achieved under the terminated contract.***

8. Section CC – While Wipro is in agreement with the clause, Wipro requests the below modification to provide for a maximum cap on the amount of penalty, since the State would nonetheless have a right to terminate the contract in the event of a continuing default:

*In the event that the contractor fails to perform any substantial obligation under the contract, the State may withhold all monies due and payable to the contractor, without penalty, until such failure is cured or otherwise adjudicated. Failure to meet the dates stipulated in the contract for the deliverables may result in an assessment of penalty due the State of \$1,000 dollars per day, until the deliverables are approved, **subject to a maximum amount of \$ 100,000 (Dollars One Hundred Thousand).** Contractor will be notified in writing when penalty will commence.*

9. Section DD – Wipro would like to propose the below section as an alternative to the requirement of filing a performance bond:

Retention Amount: The State will be entitled to withhold ten percent (10%) of the payment due to the contractor under the contract as a retention amount. The entire retention amount will be payable upon successful completion of the project. Upon completion of the project, the contractor will invoice the State for any outstanding work and for the retention amount. The State may dispute the final invoice by identifying the specific reasons for such rejection in writing to the contractor within five (5) business days of receipt of the final invoice. Otherwise, the project will be considered as accepted and the State will release the final payment and retention amount in accordance with invoicing terms under the contract.

10. Section FF –Wipro would like to clarify that the invoicing terms would be based on a milestone basis and not on the basis of completion of activity/deliverable, as stated in Wipro’s proposal, hence request the below modification:

*Payments shall **be made on the basis of milestones achieved by the contractor as stated in this Contract** not be made until contractual deliverable(s) are received and accepted by the State*

11. Section GG - Wipro would like to clarify that the invoicing terms would be based on a milestone basis and not on the basis of completion of activity/deliverable, as stated in Wipro’s proposal, hence request the below modification:

*State will render payment to contractor **within thirty days from the date of the invoice raised by the Contractor in accordance with the payment milestones agreed under the Contract** when the terms and conditions of the contract and specifications have been satisfactorily completed on the part of the contractor as solely determined by the State. Payment will be made by the responsible agency in compliance with the State of Nebraska Prompt Payment Act (See Neb. Rev. Stat. §81-2401 through 81-2408). The State may require the contractor to accept payment by electronic means such as ACH deposit. In no event shall the State be responsible or liable to pay for any services provided by the contractor prior to the Effective Date, and the contractor hereby waives any claim or cause of action for any such services.*

12. Section II – While Wipro is in agreement with this clause, we request the below modifications to reflect the general practice in Wipro:

*All contractor books, records and documents relating to work performed or monies received under the contract **(except the contractor’s internal cost and payroll records)** shall be subject to audit at any reasonable time upon the provision of reasonable notice by the State. These records shall be maintained for a period of five (5) full years from the date of final payment , or until all issues related to an audit, litigation or other action are resolved, whichever is longer. All records shall be maintained in accordance with generally accepted accounting principles. In addition to, and in no way in limitation of any obligation in the contract, the contractor shall agree that it will be held liable for any State audit exceptions, and shall return to the State all payments made under the contract for which an exception has been taken or which has been disallowed because of such an exception. The contractor agrees to correct immediately any material weakness or condition reported to the State in the course of an audit.*

13. Section LL - While Wipro is in agreement with the Section, Wipro requests an addition of the below provision to the Section to permit Wipro to propose changes to the contract:

The contractor may propose changes within the general scope of the contract to address any alterations in the scope of work or other impact to the services. Such changes shall only be approved with the written approval of the State's designee as so defined by the State from time to time.

14. Section QQ – Wipro requests the below changes to this Section:

All prices, costs, terms and conditions outlined in the proposal shall remain fixed and valid commencing on the opening date of the proposal until an award is made (and for bidder receiving award prices shall remain as bid for the duration of the contract unless otherwise so stated in the contract) or the Request for Proposal is cancelled.

Contractor represents and warrants that all prices for services, now or subsequently specified are as low as and no higher than prices which the contractor has charged or intends to charge customers other than the State for the same or similar products and services of the same or equivalent quantity and quality for delivery or performance during the same periods of time. If, during the term of the contract, the contractor shall reduce any and/or all prices charged to any customers other than the State for the same or similar products or services specified herein, the contractor shall make an equal or equivalent reduction in corresponding prices for said specified products or services.

Contractor also represents and warrants that all prices set forth in the contract and all prices in addition, which the contractor may charge under the terms of the contract, do not and will not violate any existing federal, state or municipal law or regulations concerning price discrimination and/or price fixing. Contractor agrees to hold the State harmless from any such violation. Prices quoted shall not be subject to increase throughout the contract period unless specifically allowed by these specifications.

15. Section TT – Wipro requests the below modifications to this Section:

GENERAL

The contractor agrees to defend, indemnify, hold, and save harmless the State and its employees, volunteers, agents, and its elected and appointed officials (“the indemnified parties”) from and against any and all claims, liens, demands, damages, liability, actions, causes of action, losses, judgments, costs, and expenses of every nature, including investigation costs and expenses, settlement costs, and attorney fees and expenses (“the claims”), sustained or asserted against the State **due to third party claims**, arising **directly and proximately** out of, ~~resulting from, or attributable to~~ the willful misconduct **or, gross** negligence, ~~error, or omission~~ of the contractor, its employees, subcontractors, consultants, representatives, and agents, except to the extent such contractor liability is attenuated by any action of the State which directly and proximately contributed to the claims.

INTELLECTUAL PROPERTY

The contractor agrees it will at its sole cost and expense, defend, indemnify, and hold harmless the indemnified parties from and against any and all **third party** claims, to the extent such claims arise out of, result from, or are attributable to the actual or alleged infringement or misappropriation of any patent, copyright, trade secret, trademark, or confidential information of any third party by the contractor or its employees, subcontractors, consultants, representatives, and agents; provided, however, the State gives the contractor prompt notice in writing of the claim. The contractor may not settle any infringement claim that will affect the State’s use of the Licensed Software without the State’s prior written consent, which consent may be withheld for any reason.

If a judgment or settlement is obtained or reasonably anticipated against the State's use of any intellectual property for which the contractor has indemnified the State, the contractor shall at the contractor's **option and** sole cost and expense promptly modify the item or items which were determined to be infringing, acquire a license or licenses on the State's behalf to provide the necessary rights to the State to eliminate the infringement, or provide the State with a non-infringing substitute that provides the State the same functionality. At the State's election, the actual ~~or anticipated~~ judgment may be treated as a breach of warranty by the contractor, and the State may receive the remedies provided under this RFP.

The State agrees it will at its sole cost and expense, defend, indemnify, and hold harmless the contractor from and against any and all third party claims of intellectual property infringement arising out of the contractor's access or use of any software or materials provided by the State to the contractor under this contract

PERSONNEL

The contractor shall, at its expense, indemnify and hold harmless the indemnified parties from and against any **third party** claim with respect to withholding taxes, worker's compensation, employee benefits, or any other claim, demand, liability, damage, or loss of any nature relating to any of the personnel provided by the contractor.

16. Wipro requests inclusion of the below clauses to the contract to avoid ambiguity and to ensure clarity on the expectations under the contract for the performance of the services by the contractor:
 - a. *Acceptance. Following submission of any Deliverable(s) by Contractor, testing and review will be performed by the State in accordance with previously agreed testing standards and procedures, with such testing to be completed within a time agreed by the Parties in the contract, or in the absence of a prescribed period within fifteen (15) days from the date of submission. The standard of review of the Deliverable(s) shall be material conformance with the agreed specifications. By the expiration of such review period, The State will submit a written statement (a "Deliverable Review Statement") to the Contractor Project Manager indicating acceptance of the Deliverable(s) ("Acceptance") or specifying in detail how the submitted Deliverable(s) fails to materially conform to the agreed specification, in which case Contractor shall be afforded a commercially reasonable period of time not less than thirty (30) days to correct any nonconformities, whereupon the review cycle will recommence. Deliverables will be considered to be fully and finally accepted by the State in the event the State has not submitted a Deliverable Review Statement to Contractor before the expiration of the applicable review period, or when the State uses the Deliverable in its business, whichever occurs first ("Deemed Acceptance").*
 - b. *Except for the warranties stated in this contract, the contractor excludes and disclaims all warranties, conditions or statements, whether express, implied or statutory, including, without limitation, the implied warranties of merchantability or fitness for a particular purpose.*

II. Executive Summary

The Executive Summary shall condense and highlight the contents of the solution being proposed by the bidder in such a way as to provide the Evaluation Committee with a broad understanding of the Contractor's Technical Proposal.

Bidders must present their understanding of the problems being addressed by implementing a new system, the objectives and intended results of the project, and the scope of work. Bidders shall summarize how their Technical Proposal meets the requirements of the Request for Proposal, and why they are best qualified to perform the work required herein.

Wipro and IBM have joined together in partnership to offer the Nebraska Medicaid and Long Term Care program (MLTC), the *SmartPro MedEE* eligibility and enrollment solution designed specifically to meet the needs of Nebraska MLTC. At the heart of *SmartPro MedEE* is IBM *Cúram*, the leading and only true built-for-purpose, commercial off-the-shelf (COTS) social program management solution designed specifically for government social program eligibility and enrollment management. The *SmartPro MedEE* design integrates a complete suite of applications for robust business intelligence analytics, reporting and web service components to create the *SmartPro MedEE* solution architecture.

The implementation and perfection of any eligibility system requires expert knowledge in multiple practice areas with the experience, core product knowledge, subject matter, and implementation expertise to deliver. Our Nebraska *SmartPro MedEE* approach is based on a shared Wipro/IBM vision, partnership, and commitment for Nebraska's success. Our partnership combines the resources of IBM, the IBM *Cúram* application, eligibility and configuration professionals with Wipro project management, implementation, solution design and operations experts. The partnership is more than a relationship between a system integrator and software manufacturer; it is our shared commitment to the vision, goals and objectives of MLTC which provide the foundation for all Nebraska Medicaid stakeholders to realize the benefits of the *IBM Cúram* solution.

Our approach uniquely provides the Nebraska MLTC program with unparalleled expertise from IBM centers that leverage and apply their experience implementing over 80 global IBM *Cúram* projects and over 10 Medicaid eligibility projects in the United States.

To position Nebraska to effectively respond to and manage the challenges resulting from the Affordable Care Act, Wipro and IBM have joined forces to deliver the IBM *Cúram*-based solution that meets and exceeds Nebraska's Medicaid eligibility and enrollment

requirements, now and into the future. This Wipro/IBM partnership combines our extensive

Wipro
<ul style="list-style-type: none"> ➤ 25 years of service to Missouri Medicaid ➤ Omaha, NE Data center hosting ➤ \$6B Global Systems Integrator ➤ 140,000 Professionals Worldwide ➤ Centers of Excellence <ul style="list-style-type: none"> ○ Enterprise Security ○ Analytics ○ Business Applications Services ○ Consulting ○ Project Management ○ Data Center Hosting

Medicaid and Cúram expertise, offering the Division of Medicaid and Long Term Care (MLTC) the most advanced, purpose-built technical eligibility and enrollment solution, implemented by product and integration experts backed by the full corporate resources of both companies.

Nebraska, like most states, faces urgent pressure brought on by the national economic situation, new federal healthcare mandates and the Affordable Care Act, to find ways to control Medicaid costs by increasing efficiency and decreasing costs all while serving an expanding Medicaid population.

Nebraska determined that the increasing volume and complexity of Medicaid eligibility and enrollment management could not be met by modification of the existing N-FOCUS system and that business process efficiencies nor client self-service enablement would be realized with the existing system. The adoption of newer eligibility and enrollment technologies offers Nebraska an opportunity to obtain increased efficiencies to better serve the increasing Medicaid case load cost effectively through advanced workflow automation, expanded enrollment application pathways, configurable business rules, improved and more responsive reporting capabilities as well allow MLTC to focus more on applicant and client customer service to improve the total customer experience. This solution will alleviate the full dependency on the Information Technology staff by enabling skilled business users to make policy changes within the IBM Cúram solution.

In addition, MLTC seeks an EES that is deployed and supported by a contractor who can bring experienced and knowledgeable project personnel, processes, approaches, and tools to realize the benefits of a modern, integrated eligibility and enrollment solution. The Wipro/IBM partnership and proposal enables MLTC to obtain the solution and expert resources to realize the benefits of a new technical foundation. Only the Wipro/IBM team offers expert product, infrastructure, and integration and deployment resources drawn from all practice areas in both companies.

THE WIPRO/IBM SMARTPRO MEDEE TEAM

The Wipro/IBM team proposes the ***SmartPro MedEE*** solution to support the MLTC eligibility and enrollment initiative. We selected ***SmartPro MedEE*** as the name of the solution to emphasize our partnership. The solution is built on the leading global COTS product for health and human services, IBM Cúram. It leverages world-class business processes and rules for determining eligibility based on client feedback, input of subject matter experts, and a global product development team, a team that specializes in social services and is dedicated to the ongoing enhancement of IBM Cúram. We have created a team that leverages the skills and expertise of both Wipro and IBM. The ***SmartPro MedEE*** solution strategy is summarized below in four major elements: the application stack, infrastructure, implementation and project management, and data center services.

Figure II-1 ***SmartPro MedEE*** Architecture below, displays the overall architecture of the technical solution.

Figure II-1: SmartPro MedEE Architecture

COTS Application Stack: At the heart of *SmartPro MedEE* is IBM Cúram. Most functional EES components are native to this application and it is supplemented with integrated applications for robust business intelligence analytics, reporting and web service components to create the complete system. The IBM Cúram platform is the market-leading health and human services Commercial Off-the-Shelf (COTS) software package designed to support government social program eligibility, case management, and enrollment processes. IBM Cúram is a true COTS application, not a transfer from other states that is composed of small COTS components or a transfer turned “COTS” and implementable by only one systems integrator. IBM Cúram was one of the very first COTS applications to achieve SOA certification and web-enable its services to simplify integration with other tools and legacy applications.

As reported by the Gartner Group, IBM Cúram is purpose-built to enable an enterprise strategy. It offers the following key benefits:

- The only COTS solution with out-of-the-box prebuilt MAGI and non-MAGI eligibility business rules.
- Allows for incremental modernization, meeting the needs of MLTC while providing a common health and human services data model and case structure for future expansion
- Established commercially available training curriculum and certification program will allow Nebraska to maintain as much or as little of the application on their own as desired
- Multiple partners with experience in implementing IBM Cúram enables staffing flexibility for Nebraska post implementation
- Over 80 successful implementations. States including North Carolina, Missouri, Minnesota, New Jersey, Maryland, Arkansas, Washington DC and South Carolina are using IBM Cúram.

- Strong user community with CMS participation, to prioritize product features and enhancements and share project assets to speed project implementation timelines. This includes user conferences specific to IBM Cúram where project implementation lessons are shared by the IBM Cúram clients.
- Product development organization which continues to enhance IBM Cúram based on customer feedback, CMS guidance, ongoing analysis of best practices, and general technology trends
- Web services enabled and SOA certified
- Rigorous review with MITA 3.0 compliance

Infrastructure: The *SmartPro MedEE* technical infrastructure is anchored by IBM PureSystems which accelerate the deployment of applications and analytics from weeks to days or hours with the built-in expertise and integration by design. The key benefits of the IBM PureSystems environment include:

- Cutting months off of the typical system design and procurement cycle time because PureSystems are pre-designed to support the unique memory, I/O, networking, storage, and related performance requirements of specific applications and middleware workloads. Streamlining day-to-day management processes/tooling and significantly reducing downtime due to built-in analytics and the ability to dynamically shift workloads and automatically reassign resources based on changing requirements and predictive failure analysis.
- Reducing the time and cost associated with support and upgrades by providing single system-level fixes/patches/upgrades.

By consolidating the typical system design and deployment cycle time using IBM's PureSystems, every day saved waiting for a system change, update or modification, results in faster time to implement changes and direct improvement to operations. This infrastructure approach is key to the 12 month implementation timeline we propose.

Implementation and Project Management Services: Our approach to implementation and project management starts with collaboration with MLTC to establish a strong and transparent working relationship. Our project management approach is based on a Methodology that includes concepts and practices from industry leading frameworks including:

- Project Management Institute (PMI) PM Body of Knowledge 4th Edition (PMBOK)
- Carnegie Mellon Software Engineering Institute (SEI)
- International Standards Organization (ISO)
- Earned Value Management System (EVMS)

The Wipro/IBM team proposes implementation in 12 months after contract execution. Implementation in this time frame will be accomplished through a responsible and a thoughtfully developed schedule based on our understanding of the scope of this project measured against our experience in over 80 implementations.

Our approach includes leveraging Wipro and IBM practices of business and analytics, data management, server and hardware technology, architecture, integration, testing and business

applications practices. This schedule will allow MLTC to realize the benefits of the *SmartPro MedEE* solution ahead of your allowed schedule with lower risk. This schedule is possible because our approach includes:

- Significant number of MAGI and non-MAGI business rules out-of-the-box including evidence and verification workflow logic
- As a COTS product, IBM Cúram is an SOA certified application built for reuse with configuration rules, workflow, screens and a data model that can be leveraged across the enterprise but still meet or exceed the Nebraska EES requirements.
- IBM Cúram Product Development organization is an extension of your project team, providing application support including regular product releases, patches and enhancements.
- An established training curriculum for Nebraska team members who will be participating in the project
- Leverage of project artifacts developed from other Medicaid and MAGI projects allowing reuse as appropriate to Nebraska
- Significant percentage of non-MAGI business policy analyzed and preconfigured within the IBM Cúram Medical Assistance solution
- Wipro and IBM Executive sponsorship to quickly address and resolve project issues
- Staff with Medicaid subject matter expertise coupled with IBM Cúram certification
- IBM Cúram continues to work closely with CMS on product enhancements and the Federally Facilitated Exchange integration which leads to rapid incorporation of CMS policy within the product
- SOA certification simplifies creating of interfaces to other project components

The *SmartPro MedEE* solution being proposed by Wipro and IBM is a comprehensive, seamlessly integrated, future proofed solution de-risking the launch of a successful COTS-based Medicaid Eligibility and Enrollment solution for Nebraska. The successful execution of the Wipro and IBM proposed EES system for Nebraska is predicated on a strategic alliance partnership between Wipro and IBM that blends the Wipro IT services leadership with IBM software, hardware, services and research all working together in harmony.

Data Center Services: Wipro proposes hosting the *SmartPro MedEE* production environment in our Omaha Data Center (ODC) located in the State of Nebraska. The Omaha Data Center is owned by Wipro and one of Wipro's largest Tier III+ Global Data Centers. Currently over 56 customers are hosted out of these facilities. This Data Center is ideal for the *SmartPro MedEE* solution because of its close proximity to Nebraska's management staff and it's availability for potential team members and project staff to work onsite. Inside and out, this specially designed, 86,800 square foot data center is engineered for extensive security and fail-safe redundancy. The ODC is designed solely to accommodate the special requirements of an information services utility and its clients, the data center provides environmental independence between the general office and specialized computer operations areas. Wipro's continued investment in this Omaha data center adds skilled jobs to the Nebraska economy.

Wipro is proposing our Tempe Data Center for hosting the *SmartPro MedEE* Development/ UAT/ Disaster Recovery environment. Over 28 of Wipro's US and multinational customers are hosted in the Tempe Data Center today.

SMARTPRO MEDEE ALIGNS WITH MITA FRAMEWORK 3.0

Wipro/IBMs *SmartPro MedEE* solution complies with applicable federal and state requirements and policies including MITA, CMS' Seven Conditions and Standards.

To comply with CMS "Seven Conditions" and State directives, *SmartPro MedEE* is open, flexible, scalable and adaptable. Key to our solution, a significant percentage of the business rules are delivered configured, out-of-the-box for MAGI and non-MAGI. COTS component-based architecture and open interface architectural constructs allow Nebraska MLTC to quickly and more easily modify and upgrade components, as business needs change over time. *SmartPro MedEE* is designed to allow business users to manage a large percentage of system business rule changes, thereby increasing speed to market policy implementation and lower cost through reducing reliance on IT staff to design and execute modifications.

The following table describes how the *SmartPro MedEE* solution meets the Seven Conditions and Standards guidelines.

Descriptions provided apply to the IBM Cúram solution that will serve as the foundation to the Wipro/IBM *SmartPro MedEE* proposed solution.

Table II-1: *SmartPro MedEE* Aligns with MITA Framework 3.0

Condition	Requirement	<i>SmartPro MedEE</i>
Modularity Standard	<ul style="list-style-type: none"> Open interfaces using web services Business rules external to the program code Formal SDLC Open and reusable systems architecture Componentized into business processes Built on SOA principles Multiple access channels 	<p>IBM Cúram is a modular, component-based application, which easily interfaces (via web services or other means) with other federal, state and data trading partner systems.</p> <p>IBM Cúram is rules-based, uses a formal SDLC and is built on SOA principles.</p> <p>Members and staff are able to access the system via mobile devices, email, and web applications, as well as through traditional call centers.</p>
MITA Condition	<ul style="list-style-type: none"> MITA Alignment Business Workflows 	Aligns with MITA Business Architecture, Information Architecture and Technical Architecture to assist DSS in their MITA maturity alignment
Industry Standards Condition	<ul style="list-style-type: none"> HIPAA Compliant ADA Compliant Keep system current Risk Planning Systems Development and Testing Methodology 	IBM Cúram and the EDI platform are HIPAA and Section 508-compliant. The open architecture allows for decreased maintenance costs. The SDLC and Project Management methodologies are highly mature, with many successful implementations

Condition	Requirement	<i>SmartPro MedEE</i>
Leverage Condition	Sharing artifacts between states Facilitates identification and reuse of services within the state National cloud-based repository for modular features Open Source and cloud-based products Transition and Retirement Plans	Rules and business processes may be leveraged for use in other states, as needed. The technical platform is COTS-based and can be purchased by other states, on the open market. In the future, the technology can be deployed in the cloud, and supports multi-tenancy.
Business Results Condition	Use of Business Processes and associated KPIs to drive business results Performance Dashboard to monitor and continuously improve service delivery	The <i>SmartPro MedEE</i> solution provides for an exceptional degree of automation. Operational reports are provided to ensure system processing integrity and continuous improvement. Consumer portals support on-line transaction processing to eliminate manual processes. The Wipro/IBM solution is aligned with MITA business processes and supports real-time monitoring of associated KPIs.
Reporting Condition	Provides automated reports on demand, to authorized requesters	The <i>SmartPro MedEE</i> solution provides for automated reports, as needed, through 3rd party reporting tools, included those produced by our proposed Cognos reporting tool. Additionally, Wipro's IBM Sterling Commerce File Gateway product automates and manages schedule interface interactions with CMS and other data trading partners.
Interoperability Condition	Loosely coupled, component-based architecture	<i>SmartPro MedEE</i> is architected on open solutions that provide for exposed interfaces and easy integration with other components, modules and systems including the federal data hub, eligibility systems, Medicaid plans and other parties.

THE WIPRO/IBM PARTNERSHIP

Wipro and IBM have entered into a partnership to deliver the *SmartPro MedEE* solution to Nebraska. This partnership extends further by working collaboratively with Nebraska in implementing the system. The following section will give a brief overview of Wipro and IBM.

Wipro and IBM are uniquely positioned among the competition to serve Nebraska not simply to implement the IBM Cúram solution, but to do so in a way that “works for Nebraska”. As the prime contractor, we ensure a Nebraska-centric project environment that facilitates the successful implementation and integration of forward-leaning, state-of-the-art integrated eligibility technology. In collaboration with the MLTC program, we share overall responsibility for the project success, including on-time delivery and management of our team.

Wipro

As the prime contractor and systems integrator, Wipro Inc., is a global IT company with deep roots in Medicaid system integration, operation, hosting and data center services. Our expertise and knowledge of Medicaid and Medicaid eligibility processes emanates from over 25 years’ experience serving as the Fiscal Agent for your neighbor, the Missouri Medicaid program. Wipro’s global headquarters are located in Bangalore, India and US headquarters are located in East Brunswick, New Jersey. As of 2013, the Company had 140,000 employees in 54 countries. Wipro is among the three largest IT services companies in India.

Wipro currently provides the State of Missouri with comprehensive Medicaid Fiscal Agent Services including the Medicaid Management Information System (MMIS) operations and software support, claims processing, and related business process operations. In addition, Wipro has been a trusted CMS eligibility and enrollment contractor for Medicare Advantage plans since 1988. Our full complement of Medicare eligibility and enrollment services includes eligibility verification services, enrollment and disenrollment transaction processing of Medicare beneficiaries in Medicare Advantage plans, including part D plans, risk adjustment and premium forecasting and reconciliation services. We were recently named as the CMS designated eligibility and enrollment agent for the national Long Term Care Demonstration program.

IBM

International Business Machines Corporation (“IBM”), headquartered in Armonk, N.Y., is one of the world’s largest information technology services (IT) companies. As an IT services leader, IBM’s solutions and services span the major industries, including financial services, healthcare, government, automotive, telecommunications, and education, among others. It is the diversity and breadth of IBM’s portfolio—spanning hardware, software, services, research, financing and technology—that separates IBM from other companies in the IT industry.

An innovator in the health and human services industry throughout the twentieth century, IBM in 1992 entered into a contract with the State of California for an \$80 million engagement to develop, implement and maintain California's child welfare system, including a network that linked nearly 10,000 county social workers and staff.

In 2000 IBM entered a Global Strategic Alliance with Cúram Software, an organization with global recognition from major industry analysts as the international thought leaders for social enterprise management (SEM) software solutions.

Cúram’s products are implemented in a wide range of government and state agencies across the United States, Canada, Australia, New Zealand, and Europe. IBM recognized the complexities its Health and Human Service clients are facing in today’s challenging landscape and acquired Cúram Software in December 2011 to bring more value to its clients. In Cúram, IBM found a mature, well-developed social service platform designed specifically for the requirements of social services agencies working to provide critical benefits to an increasing number of citizens.

At the core of our Solution is the IBM Cúram Social Program Management Platform (SPMP). Using Cúram as the core application framework, we will leverage Cúram’s data model and infrastructure, along with pre-built content (business processes, rules, and workflow) designed specifically for Medicaid processes. In our solution, we take advantage of the research and development already part of the Cúram platform to support the requirements of the Affordable Care Act (ACA).

IBM’s Cúram product teams have thoroughly analyzed the Medicaid, CHIP, and the additional rules within the Affordable Care Act to develop a series of pre-built eligibility rules that give our

Why select the IBM Cúram-based solution?

- **Only proven COTS solution in the market built expressly for Health and Human Services**
- **Leading COTS software in the integrated eligibility market as evidenced by over 80 successful implementations and selection by multiple new customers in 2012-13**
- **The IBM Cúram Solution is the only commercially available software that incorporates the federal CMS guidance for MAGI Medicaid processing.**
- **Significant prebuilt MAGI and non-MAGI**
- **The one integrated and interoperable COTS solution that will seamlessly support incremental eligibility systems modernization by supporting OTB (out-of-the-box) all client programs. including TANF, SNAP, and Child Care.**
- **Market leader for COTS solutions in Health and Human Services as stated by the Independent analyst firms of Gartner and Forrester**
- **Extensive experience in implementing Master Data Management solutions for state government as well as Medicaid fraud detection.**

offering the most advanced starting point to complete the requirements validation and design of the Nebraska eligibility rules for Medicaid (MAGI, non-MAGI and CHIP).

SMARTPRO MEDEE: NEBRASKA-CENTRIC, MARKET-TESTED AND RELIABLE

The Wipro/IBM partnership began in the 1990's and today, Wipro is a leading IBM Global System Integrator having achieved the coveted IBM Premier Alliance Partner designation.

Wipro and IBM believe that this partnership offers the most experienced team available in the market to address the requirements of this RFP and to position MLTC for the future. Our experience extends beyond the market-tested IBM Cúram-based software solution and demonstrated software implementation capabilities; our combined capabilities ensure the effective and timely delivery of this project. Our partnership offers the low-risk proven solution implemented by the experts, making Nebraska MLTC a shining example of how to "get it right. The benefit to Nebraska by selecting the Wipro/IBM team is that Nebraska will be selecting an integrated organization to support the project. Many times projects stumble when there are too many products and too many partners in the mix or they rely heavily on implementing a solution that may have been a perfect fit for another state but requires extensive customization to be the right fit for Nebraska, resulting in significant change orders and increased, unplanned expense. By using IBM to provide everything from business analytics tools to IBM Cúram to integration tools to Master Data Management, the risk of integration issues and finger-pointing is minimized.

Our combined highly successful corporate experience in healthcare, Medicaid, eligibility and enrollment processes, system integration, data center services and advanced server technology offers the NE MLTC program the superior low risk strategy to transition from the 20 year old legacy system to a modern, highly configurable solution that delivers all the States key objectives and benefits.

Our commitment, product, collaborative approach, superior platform and project leadership will provide Nebraska with the foundation to meet its vision for Medicaid service delivery well into the future.

III. Corporate Overview

A. BIDDER IDENTIFICATION AND INFORMATION

The bidder must provide the full company or corporate name, address of the company's headquarters, entity organization (corporation, partnership, proprietorship), state in which the bidder is incorporated or otherwise organized to do business, year in which the bidder first organized to do business, whether the name and form of organization has changed since first organized, and Federal Employer Identification Number and/or Social Security Number.

Wipro, LLC submits this proposal to the State of Nebraska. Our headquarters are located at 2 Tower Center Boulevard, Suite 2200, East Brunswick, NJ 08816. The company's Federal Employer Identification Number is [REDACTED]

The company's history began in 1998, when Wipro, Limited formed a US corporation named Wipro, Inc. in the State of Connecticut. In July 2011 the company changed its name from Wipro, Inc. to Wipro, LLC.

Wipro, LLC, has several step subsidiaries, all of which are US Corporations, such as Infocrossing, Inc.

Wipro achievements:

- The first PCMM Level 5 software company—an achievement that impacts all Wipro software development
- A strategic partner to 7 of the world's top 10 most innovative companies
- The world's largest independent R&D services provider

Wipro Limited incorporated in India on December 29, 1945; the legal structure was termed a "Public Limited Liability Company." Wipro Limited (also designated Wipro, LTD. or Wipro) is registered through the Registry of Companies and Businesses under File Number 0208000, in Bangalore Karnataka, India.

Wipro shares have been publicly listed and traded on the NYSE (WIT) since 2000.

- As the sole owner of Wipro, LLC, the following Wipro statistics are indicative of the financial and other resources that will back the success of this bid to NE:
- Net revenues for the year ended March 31, 2013 -- \$7.95 billion
- 145,000 employees across 98 nationalities (Q4, 2012-13)
- 72 plus global delivery centers and 50 plus industry-specific 'Centers of Excellence' in more than 54 countries

B. FINANCIAL STATEMENTS

The bidder must provide financial statements applicable to the firm. If publicly held, the bidder must provide a copy of the corporation's most recent audited financial reports and statements, and the name, address and telephone number of the fiscally responsible representative of the bidder's financial or banking organization.

If the bidder is not a publicly held corporation, either the reports and statements required of a publicly held corporation, or a description of the organization, including size, longevity, client base, areas of specialization and expertise, and any other pertinent information must be submitted in such a manner that proposal evaluators may reasonably formulate a determination about the stability and financial strength of the organization. Additionally, a non-publicly held firm must provide a banking reference.

The bidder must disclose any and all judgments, pending or expected litigation, or other real or potential financial reversals, which might materially affect the viability or stability of the organization, or state that no such condition is known to exist.

Wipro LLC, is a wholly owned subsidiary of Wipro Inc., a publicly traded company. As such, Wipro discloses its financial statements through its annual reports to the investor community and filings with the SEC. Wipro's most recent annual report, containing audited financial statements for 2012, is attached as Exhibits and Samples 1. Wipro Financial Statement as of September 2013. Summary information is displayed below in Figure III-1.

Figure III-1: Wipro Financial Statement as of September 2013

As a public company, IBM discloses its financial statements through its annual reports to the investor community and filings with the SEC. IBM's most recent annual report, containing audited financial statements for 2012, is attached as Exhibits and Samples 2. Additional financial information and historical annual reports can also be found on the annual report section of IBM's Investor Relations site at: <http://www.ibm.com/annualreport/>

Additionally, financial highlights from the most recently audited financial statements are included below in Figure III-2.

Financial Highlights

International Business Machines Corporation and Subsidiary Companies

(\$ in millions, except per share amounts)

For the year ended December 31:	2012	2011
Revenue	\$104,507	\$106,916
Net income	\$ 16,804	\$ 15,886
Operating (non-GAAP) earnings*	\$ 17,627	\$ 18,318
Earnings per share of common stock		
Assuming dilution	\$ 14.37	\$ 13.06
Basic	\$ 14.83	\$ 13.25
Diluted operating (non-GAAP)	\$ 15.25	\$ 13.44
Net cash provided by operating activities	\$ 16,596	\$ 16,846
Capital expenditures, net	4,307	4,052
Share repurchases	11,095	15,046
Cash dividends paid on common stock	3,779	5,479
Per share of common stock	2.90	2.90
At December 31:		
Cash, cash equivalents and marketable securities	\$ 11,126	\$ 11,822
Total assets	110,213	116,435
Working capital	5,807	\$ 8,826

Figure III-2: IBM Annual Report/Audited Financial Statements

C. CHANGE OF OWNERSHIP

If any change in ownership or control of the company is anticipated during the twelve (12) months following the proposal due date, the bidder must describe the circumstances of such change and indicate when the change will likely occur. Any change of ownership to an awarded vendor(s) will require notification to the State.

Wipro does not anticipate a change in ownership or control of the company or any of its subsidiaries during the 12 months following the proposal due date. We acknowledge the requirements to notify the State should any change of ownership occur after award of the subject contract award.

Wipro is partnering with IBM, a corporation that is over 100 years old and is one of the most recognizable brands in the world and the leading provider of information technology globally. As a publically held company, IBM does not anticipate any changes of ownership or ownership structure in the next twelve months.

IBM is owned by its 500,000+ stockholders who are members of the general public and trade shares publicly, through a listing on the New York Stock Exchange (NYSE:IBM). At year-end 2012 (the latest available reported date), there were 491,541 registered owners of IBM stock. Another 1,600,000 stockholders own IBM stock through brokerage firms, banks, credit unions, and other financial institutions. Ownership is open to anyone, including employees, institutions, individuals, pension funds, and mutual funds.

This ownership is differentiated from privately held companies where the shares are held by a small group of individuals, who often are members of one or a small group of families or otherwise related individuals, or other companies. IBM does not anticipate any changes in ownership with would conflict with, or preclude IBM from, entering into an agreement with or performing services for the State of Nebraska.

IBM does not disclose the Social Security numbers and other personal information about its employees and stockholders. Information that does exist to address such items can be found in the annual report filed with the Securities and Exchange Commission or on our website at:

<http://www.ibm.com/investor/company/index.phtml>.

D. OFFICE LOCATION

The bidder's office location responsible for performance pursuant to an award of a contract with the State of Nebraska must be identified.

Wipro's hosting facility is on Miracle Drive in Omaha, Nebraska. This facility provides ample security and space for our technical hosting team, as well as overflow accommodations for the project team.

Wipro will use state offices in Lincoln, Nebraska, for onsite project personnel. This approach increases collaboration between state and Wipro staff and also makes best use of available resources.

IBM is pleased to be able to use its global presence and vast resources across North America to support the project activities at the State of Nebraska. IBM brings the expertise of services, technology, and hardware resources and a local presence, including IBM offices at in Omaha at 1111 N 102nd Court, Suite 231 Omaha, NE 68114 and Lincoln at the Federal Trust Building, 134 South 13th Street, 10th Floor, Suite 1000, Lincoln, NE 68508. IBM may perform project tasks at a location deemed suitable at the State's discretion. This global and local presence unique enables IBM with the ability, capacity, and skill sets to perform and deliver to the State and its complex and unique needs.

E. RELATIONSHIPS WITH THE STATE

The bidder shall describe any dealings with the State over the previous five (5) years. If the organization, its predecessor, or any party named in the bidder's proposal response has contracted with the State, the bidder shall identify the contract number(s) and/or any other information available to identify such contract(s). If no such contracts exist, so declare.

Wipro operates a data center in Omaha Nebraska and as such, maintains a license to do business in the State of Nebraska.

IBM and the State of Nebraska have enjoyed a relationship for over 50 years, since the time IBM was incorporated to do business in the State. Over that time, IBM and the State have maintained a very positive business relationship across numerous transactions. IBM holds a Customer Agreement with the State.

1. IBM Customer Agreement SSM8885 signed on 18 August 2011. (Signatory: Diane Mohr, Dixon County Clerk)

2. IBM Customer Agreement SSM7090 signed on 26 March 2010. (Signatory: Loleen Bressler, Dean of Administrative Services)
3. IBM Customer Agreement SSM3530 signed on 03 December 2007. (Signatory: V. Ginada Hostetler, Grand Islands Veterans Home)

Over this customer agreement, IBM has provided the State with hardware and software including warranties and maintenance coverage as part of this agreement.

Within the last 5 years, IBM has not held any services contracts with the State of Nebraska.

F. BIDDER'S EMPLOYEE RELATIONSHIPS TO THE STATE

If any party named in the bidder's proposal response is or was an employee of the State within the past twenty-four (24) months, identify the individual(s) by name, State agency with whom employed, job title or position held with the State, and separation date. If no such relationship exists or has existed, so declare.

If any employee of any agency of the State of Nebraska is employed by the bidder or is a subcontractor to the bidder, as of the due date for proposal submission, identify all such persons by name, position held with the bidder, and position held with the State (including job title and agency). Describe the responsibilities of such persons within the proposing organization. If, after review of this information by the State, it is determined that a conflict of interest exists or may exist, the bidder may be disqualified from further consideration in this proposal. If no such relationship exists, so declare.

Wipro declares that no party named in our proposal is or was an employee of the State within the last twenty-four months.

IBM employs over 420,000 personnel across the globe in all of its functions. As a company of such size, it is impossible to determine the extent of relationships between all IBM employees and the State of Nebraska. However, IBM provides an assurance that no member of the bid team for this response effort, nor any individual that anticipated to be involved with the project holds a relationship with the State that may create a conflict of interest on the part of either IBM or the State.

G. CONTRACT PERFORMANCE

If the bidder or any proposed subcontractor has had a contract terminated for default during the past five (5) years, all such instances must be described as required below. Termination for default is defined as a notice to stop performance delivery due to the bidder's non-performance or poor performance, and the issue was either not litigated due to inaction on the part of the bidder or litigated and such litigation determined the bidder to be in default.

It is mandatory that the bidder submit full details of all termination for default experienced during the past five (5) years, including the other party's name, address and telephone number. The response to this section must present the bidder's position on the matter. The State will evaluate the facts and will score the bidder's proposal accordingly. If no such termination for default has been experienced by the bidder in the past five (5) years, so declare.

If at any time during the past five (5) years, the bidder has had a contract terminated for convenience, non-performance, non-allocation of funds, or any other reason, describe fully all circumstances surrounding such termination, including the name and address of the other contracting party.

While Wipro has had early termination of some client accounts in the last 5 years, these are not of material value and would not have an adverse effect on the services to be rendered by Wipro under this RFP

In May 2010, IBM filed suit against the State of Indiana ("State"), seeking payment of termination amounts specified in a contract between IBM and the State, and on that same date, the State filed suit against IBM claiming that IBM had breached the contract. The case was tried in Marion County, Indiana Superior Court from late February to early April 2012. On July 18, 2012, the court rejected the State's claims in their entirety and awarded IBM \$52 million, plus interest and costs. The parties have each appealed portions of the court's ruling, and that appeal remains pending.

H. SUMMARY OF BIDDER'S CORPORATE EXPERIENCE

The bidder shall provide a summary matrix listing the bidder's previous projects similar to this Request for Proposal in size, scope and complexity. The State will use no more than three (3) narrative project descriptions submitted by the bidder during its evaluation of the proposal.

1. Wipro Corporate Experience

Wipro Inc. is a global information technology (IT) consulting and outsourcing Service Company located in Bangalore, India and East Brunswick, New Jersey. Wipro incorporated in 1945, and has been a publicly-traded corporation since 2000, New York Stock Exchange (NYSE:WIT). As of 2012, the Company had 140,000 employees in 54 countries. Through its subsidiaries, Wipro offers healthcare and infrastructure engineering, consumer care and BPO. Wipro's 25 year engagement with the State of Missouri through its subsidiary Infocrossing, Inc. (acquired by Wipro in 2007), provides a comprehensive Medicaid Fiscal Agent Services solution. Services include Medicaid Management Information System (MMIS) operations and software support. The software is hosted in one of the world class data centers that were part of the Infocrossing acquisition. A full range of claims processing functions are provided from a facility in Jefferson City, Missouri. While Medicaid eligibility functions are provided by State of Missouri personnel, Wipro interfaces with the State's eligibility system and has extensive knowledge of the Medicaid eligibility processes and the State's of Missouri's Medicaid population. Wipro applies our extensive Medicaid eligibility knowledge to the State of Nebraska.

To position Nebraska to effectively respond to and manage the challenges resulting from the Affordable Care Act, Wipro and IBM have joined forces to deliver the IBM Cúram-based solution that meets and exceeds Nebraska's Medicaid eligibility and enrollment requirements, now and into the future. This Wipro/IBM partnership combines our extensive Medicaid and Cúram expertise, offering the Division of Medicaid and Long Term Care (MLTC) the most advanced, purpose-built technical eligibility and enrollment solution, implemented by product and integration experts backed by the full corporate resources of both companies. Our approach is unique as we are providing capability that includes purpose built expertise centers that leverage the implementation of over 80 global IBM Cúram implementation projects and over 10 Medicaid eligibility projects in the United States.

In the role of Prime Contractor, Wipro accepts many of the bedrock tasks; activities that act as the foundation upon which to set up and carry the team forward to the goal. Many of these activities are the same as or similar to Medicaid Fiscal Agent services we have provided to the State of Missouri for 25 years, and activities that we are well-suited to deliver time after time as part of other IT services, outsourcing, and consulting engagements. These tasks include:

- Performing overall project management using PMI-certified staff and techniques to manage toward successful project completion
- Working hand in hand with the State and other members of the extended team to construct an efficiently structured and meaningful requirements validation process
- Using a “train the trainer” approach to teach authorized technical staff how to implement, operate, maintain, and modify the new eligibility and enrollment software we propose (which will allow them to train end users, as needed, and to begin building a bench of technically proficient staff who will be able to take over the system, at the State’s option)
- Leading the process of establishing interfaces required to link the software solution with the various existing human services eligibility processes and systems
- Assuming certain key staff roles, including an overall PMP certified program manager to support achievement of project objectives and requirements and to assist in the full integration of software implementation and integration services
- Performing on-going software maintenance, including business analysis tasks, requirements clarification and validation services needed to execute approved changes
- Providing required supplemental technology and services, such as scanning, copying, mail and other services needed to run an efficient project

Sound project management principals and proven success in managing the project team will be particularly important as this project progresses. In the section that follows, Wipro has included a general company overview of our solution partner, IBM.

2. IBM Corporate Experience

IBM (which is headquartered at 1 New Orchard Road Armonk, NY 10504) is one of the world’s largest information technology services companies. IBM is owned by its 500,000+ stockholders who are members of the general public and trade shares publicly, through a listing on the New York Stock Exchange (NYSE:IBM). As of February 10, 2012, there were 504,093 registered owners of IBM stock. Another 1,600,000 stockholders own IBM stock through brokerage houses, banks, credit unions, and other financial institutions. Ownership is open to anyone, including employees, institutions, individuals, pension funds, and mutual funds. As an IT services leader, IBM’s solutions and services span the major industries, including financial services, healthcare, government, automotive, telecommunications and education, among others.

The company’s work in social services began in 1935, assisting the US Government to implement management and accounting systems for the Social Security Act of 1935. Described at the time as “the largest bookkeeping operation in the history of the world,” IBM continued its role as an innovator in the social services industry throughout the 20th century, expanding to the state and local level. In 1992 the State of California awarded IBM an \$80 million contract to develop,

implement and maintain California's child welfare system, including a network that linked nearly 10,000 county social workers and staff.

In 2000 IBM entered a Global Strategic Alliance with the Irish firm Cúram Software Ltd., an organization with global recognition from major industry analysts as the international thought leaders for social enterprise management software solutions. Cúram's business model was to work with global system integration partners such as IBM to implement Cúram products in a wide range of government and state agencies across the United States, Canada, Australia, New Zealand, and Europe. Cúram provided the product and business expertise while the systems integration partners provided expertise in project elements such as data migration, data cleansing, project planning, project management and other generic implementation project activities.

IBM acknowledged the complexities its Health and Human Service clients are facing in today's challenging landscape and acquired Cúram Software in December 2011 to bring more value to its clients. IBM's unparalleled experience over the past twelve years implementing Cúram Software enterprise case management projects provides the IBM team with unique insight into the opportunities and pitfalls inherent in any Cúram implementation.

IBM has a strong track record of working successfully with social services agencies to deliver mission-critical applications. We have a number of examples that collectively show IBM's success in the following areas:

- Delivering complicated, mission-critical social services case management applications successfully
- Bringing insight and innovation to help our clients solve their most pressing business and technical issues
- Proving the value of Cúram-based solutions to social services agencies
- Integrating client staff into the project delivery teams and successfully transferring knowledge

The IBM team's social services solutions have been successfully implemented in similar projects in most states, four Canadian provinces, Australia, New Zealand, and the United Kingdom. More than five million recipients have received benefits from solutions deployed and delivered by the IBM team. In addition, more than 38,000 government employees in the United States are actively using these solutions to manage public assistance in their jurisdictions. Through these engagements, we have gained knowledge, skills, lessons learned, tools, and assets to support a modern Nebraska Eligibility and Enrollment System (EES) program. Therefore, we can provide an effective, efficient delivery of a large-scale solution meeting the needs of Nebraska children and families and achieving the goals set forth by the State.

Detailed Project Summaries

Bidder must provide narrative descriptions to highlight the similarities between their experience and this Request for Proposal.

Wipro/IBM envisions a unique approach to satisfying the State's vision of a comprehensive, fully integrated, state-of-the-art automated human services eligibility, enrollment and case management system. Our approach stems from another of the State's objectives for the solution's functional

requirements: acquisition of COTS products to develop a “technology enabled, user-friendly, consumer-centric eligibility and enrollment process to leverage and integrate, as appropriate, existing administrative and technical infrastructure for the State’s Medicaid and CHIP programs as well as for other human service programs.

After studying what the State of Nebraska intends to accomplish, our approach is that the State’s best value lies in acquiring:

- The best fit-for-purpose software applications that are proven to perform as specified, available as COTS, are SOA enabled and hardware neutral, are highly configurable, and designed with a high degree of end-user centricity while using as much automation and electronic verification as possible
- A knowledgeable and experienced system integrator that specializes in the selected applications and technology, and has a reputation for bringing talented, technically savvy staff to each assignment
- An experienced healthcare IT company whose performance and reliability is known by the State and that is acknowledged within the IT industry as being a leading integrator; a company recognized as a leader in business process outsourcing and proven for effective project management

The IBM Cúram product represents the best fit-for-purpose software applications, which have been installed and are in use by numerous satisfied customers. Table III-1: *SmartPro MedEE* Solution Experience in State Programs itemizes three current or recently completed, directly relevant State projects on which the same software or services have been used that are proposed by the Wipro/IBM team.

While the IBM team members have implemented many similar projects, we present descriptions of two of those projects, similar to Nebraska EES as they were large-scale eligibility system implementations, with Cúram Software at the core of the solution.

Individual, project summaries follow.

Table III-1: *SmartPro MedEE* Solution Experience in State Programs

State Programs	Wipro	IBM (Cúram)
Missouri Medicaid Fiscal Agent	✓	
North Carolina Families Accessing Services through Technology (NC FAST)		✓
South Carolina Member Management Technology Framework		✓

Project Summary #1

Project Name	Missouri Medicaid Fiscal Agent
Project Time Period	July, 2007 thru current
Client	State of Missouri, Department of Social Services, MO HealthNet Division
Contact Name Phone Fax Email	Darin Hackmann 573.680.1122 Darin.M.Hackmann@dss.mo.gov
Scheduled and Actual Completion Dates	July, 2007 thru current
Work Performed as (Prime Contractor or Subcontractor)	Provide fiscal agent services for the State of Missouri's Medicaid program.
Project Description	<p>Wipro provides fiscal agent services which include data center hosting functions; maintenance, modification and enhancement of the MMIS; participant, provider, managed care, clinical authorization and technical call centers; production of Medicaid identification card and provider manuals; third party liability cost avoidance functions, claims processing operations including mailroom, data entry, resolutions; network and physical security; and HIPAA compliance.</p> <p>Wipro is the system of record for Missouri's Medicaid Eligibility Master File whereby we processing eligibility transactions on a daily basis.</p>
Contractor Responsibilities	Wipro's role is to provide Missouri with business process operation services along with development, implementation and operation of the MMIS. This includes all functions associated with maintaining the State of Missouri's Medicaid Eligibility Master File.

Project Summary #2

Project Name	North Carolina Families Accessing Services through Technology (NC FAST)
Project Time Period	April 2011 – June 2017
Client	North Carolina Department of Health and Human Services
Contact Name Phone Fax Email	Anthony Vellucci, Program director, NC FAST (919) 707-4002 (919)510-4388 Anthony.Vellucci@dhhs.nc.gov
Scheduled and Actual Completion Dates	In progress.
Work Performed as (Prime Contractor or Subcontractor)	Performing project management and providing business and technical resources. Providing operations and maintenance services on the base software product and state approved customizations.
Project Description	The North Carolina Department of Health and Human Services' (DHHS) NC FAST program is an enterprise approach to delivering family-centered benefits and services to the citizens of North Carolina through enabling case management technology. In 2008, DHHS selected the Cúram Business Application Suite as the underlying integrated case management solution for NC FAST. DHHS chose Cúram as they recognized the advantages of using a proven COTS product specifically built for health and human services that could satisfy their needs with minimal customization. Cúram supports DHHS's goal of a phased implementation that allows support for programs to be added incrementally while providing an enterprise foundation for the programs. North Carolina also recognized the value in having a rules engine that had the content for all the US SNAP, cash assistance and Medicaid programs out-of-the-box, without development effort. At the completion of the six projects, IBM Cúram will be used for SNAP, TANF, Medicaid including MAGI and non-MAGI, child welfare, child care and adult protective services.
Contractor Responsibilities	<ul style="list-style-type: none"> • Assist in development of host environment and other environments in support of the project • Install product software, customizations, software tools, and necessary third-party software • Train State staff on the use of the software solution and tools • Business analysis and documentation including fit/gap analysis and documentation • Architectural design and review • System performance analysis • Project estimation • Provide optional technical support services • Develop customized software when authorized by the State • Provide consultation, tools, and support for data conversion activities • Provide operations and maintenance services for the base product and any State-approved customizations • Provide issue triage and help desk support services - base product and customizations

Project Summary #3

Project Name	South Carolina Member Management Technology Framework
Project Time Period	February 2013 to Present
Client	South Carolina Department of Health and Human Services
Contact Name Phone Fax Email	John Supra, Deputy Director and CIO SC DH&HS Phone: (310) 714-1619 supra@scdhhs.gov
Scheduled and Actual Completion Dates	Scheduled Start Date is 01/2013. Scheduled Completion Date is 12/2013 Actual Start Date was 02/2013 to present
Work Performed as (Prime Contractor or Subcontractor)	IBM Cúram is working directly with the State's IT Division. The IT Division assumed the role of System Integrator in a public/private partnership arrangement with Clemson University, who host HHS IT systems and assist in system development.
Project Description	<p>South Carolina Department of Health and Human Services (SCDHHS) is responsible for administration of the State's Medicaid program and other benefit programs. SCDHHS wishes to modernize their eligibility, enrollment and member management systems to deliver a world class Medicaid enterprise. Following a formal request for proposal (RFP) process, the State chose IBM Cúram as the underlying technology for supporting the delivery of Medicaid and other benefit programs.</p> <p>IBM Cúram will provide a cost-effective and flexible technology framework which SCDHHS – working with Clemson University – can use to design, configure, implement, and operate a replacement Eligibility Enrollment and Member Management System (EEMMS) for the State's Medicaid and other human services programs.</p> <p>While the State is not hosting its own health insurance exchange, the Cúram system will be doing the MAGI determinations and having interaction with Federal exchange and service hub.</p> <p>The system will provide functionality for eligibility, enrollment, and case management for: Medicaid, advanced premium tax credits and other healthcare affordability programs.</p> <p>Other benefit programs and the State is now exploring options for managing Care Coordination.</p> <p>Programs Supported: Medicaid, advanced premium tax credits, and other healthcare affordability programs.</p>
Contractor Responsibilities	<p>IBM is providing the underlying software platform for the system, namely the IBM Cúram Social Program Management Platform.</p> <p>IBM is also providing dedicated Cúram specialists to the project to advise and assist on the system implementation.</p>

I. SUMMARY OF BIDDER'S PROPOSED PERSONNEL/ MANAGEMENT APPROACH

- I. Describe policies, plans, and intentions with regard to maintaining continuity of personnel assignments throughout the performance of any agreement resulting from this RFP.

The Wipro/IBM team's approach to organization and staffing for the Nebraska Eligibility and Enrollment project is based on the critical need to have the right staff, in the right place, at the right time. We fully appreciate the need to minimize risk, and ensure a successful project by deploying fully trained and experienced resources. The key team members assigned to the project have been selected based on their thorough knowledge of the proposed solution, their extensive experience in working in the health and human services environment, and first-hand experience in successfully planning for Cúram solution implementations. Adherence to the project plan, close coordination and open communication among all the project team, state personnel and stakeholders is critical in delivering all activities necessary to establish effective project governance and performing all necessary task effectively and on time.

To support and successfully implement and manage the project, we understand the urgency to engage qualified and experienced staff, ready to begin work on day one. The Wipro/IBM team collaborated to select the best qualified candidates. Key staff were selected based on their experience in health and human services systems design, implementation and operations as well as their proven experience deploying the Cúram eligibility solution.

- II. Discuss the Bidder's plans to avoid and minimize the impact of personnel changes.

All of the Wipro/IBM Team members are committed to the approach of "partnering for success". This means we have access to Cúram solution domain experts from the source, as well as very significant IT expertise and subject matter experts. We offer Nebraska a high degree of certainty we can access and leverage our collective human capital resources at the level of intensity and on the schedule needed to deliver on time results for this project.

- III. Identify planned backup personnel assignments.

The importance of deploying well qualified and experienced staff for this project is a crucial element of success. Our key staff are exceptionally well qualified and experienced to lead this project and achieve the objectives on time. We are placing well-seasoned and highly capable resources in key positions on the Nebraska project. These are qualified individuals with the right mix of knowledge, experience, and expertise to carry out the project. These individuals were chosen specifically for their proven leadership skills, depth of knowledge, prior eligibility system experience, knowledge of the Cúram solution, large-scale system experience, and ability to successfully perform the tasks required.

All of the Wipro/IBM Team members are committed to the approach of "partnering for success". This means we have access to Cúram solution domain experts from the source, as well as very significant IT expertise and subject matter experts. We offer Nebraska a high degree of certainty we can access and leverage our collective human capital resources at the level of intensity and on the schedule needed to deliver on time results for this project.

- IV. Commit to using the personnel identified in the proposal and agree to the State of Nebraska's right to approve proposed personnel changes during the term of the contract.

The Wipro/IBM team acknowledges and is committed to the requirement stated above. We recognize the importance of deploying qualified staff resources on the project. We will engage well qualified experienced staff and reiterate our ability to resource this project with exceptional talent. Our Wipro/IBM Team approach and resource acquisition strategy lends the highest credibility to our commitment and obligations to this project. While we plan on maintaining a consistent team through the life of the project, we are aware that some times staff changes are unavoidable. In those instances, The Wipro/IBM team will identify appropriate replacement personnel and will discuss the choices with the State. The State will have the right to approve proposed personnel changes during the term of the contract.

- V. Agree that the Bidder's proposed project personnel may not be reassigned, replaced, or added during the project without the prior written consent of the Department's Project Manager. Should a key staff position be vacated, the IV&V Contractor must give the Department resumes of and an opportunity to interview and approve, potential replacements for that employee.

The Wipro/IBM team acknowledges and agrees that the key personnel may not be reassigned, replaced, or added during the project without the prior written consent of the Department's Project Manager. We acknowledge and agrees to provide the Department with resumes and an opportunity to interview and approve potential replacements for key personnel.

- VI. Agree that the Bidder's proposed key project personnel may not be assigned new or additional contract assignments outside the State of Nebraska contract, without the prior written consent of the Department Project Manager.

The Wipro/IBM team acknowledges and agrees that the Bidder's proposed key project personnel may not be assigned new or additional contract assignments outside the State of Nebraska contract, without the prior written consent of the Department Project Manager.

- VII. Agree that the Department Project Manager reserves the right to require a change in the IV&V Contractor's project personnel at the Department Project Manager's discretion and that the Department must be given an opportunity to interview and approve potential replacements for that employee. However, the Department will not unreasonably exercise this option and will take reasonable steps to work with the IV&V Contractor toward a solution.

The Wipro/IBM team acknowledges and agrees that the Department Project Manager reserves the right to require a change in the IV&V Contractor's project personnel at the Department Project Manager's discretion and that the Department must be given an opportunity to interview and approve potential replacements for that employee.

1. Key Staff Resumes and References

Below we present the detailed resumes of our key staff, their qualifications and expertise in health and human services and eligibility and enrollment business. Each staff member brings outstanding qualifications and understanding of the responsibilities for their critical role in this project.

Figure III-3 displays the proposed Wipro/IBM team organization chart with key project staff named.

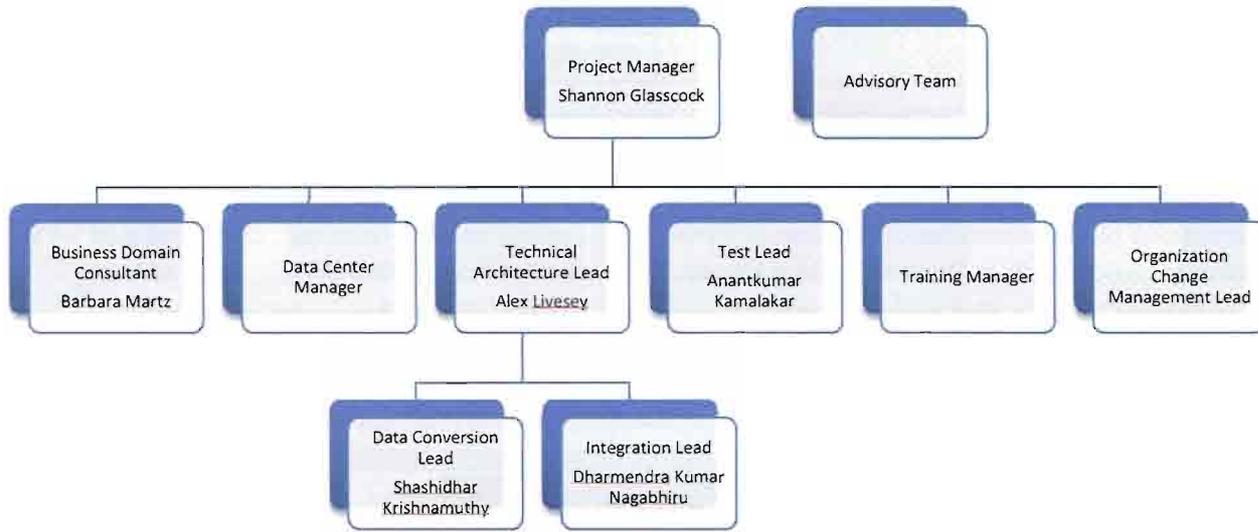

Figure III-3: Wipro/IBM Team Structure

Table III-2: Key Staff Roles and Qualifications summarize each key staff member’s role in the project, their years of experience, experience level/source organization, and applicable certifications. The individual key staff resumes with detailed professional histories close this proposal section.

Following that figure are the key staff resumes for submission.

Table III-2: Key Staff Roles and Qualifications

Name	Position	Years of Experience	Experience Level/Source	Certifications
Shannon Glasscock	Project Manager	25	Senior Project Manager/Wipro	PMP, PMI Certified
Alex Livesey	Technical Architecture Lead	15 with 9 on Cúram	Manager/IBM	PMP Cúram Certified Developer Cúram Certified Business Professional
Anantkumar Kamalakar	Test Lead	13	Manager/Wipro	Bachelor of Engineering
Shashidhar Krishnamuthy	Data Conversion Lead	10	Technical Project Manager and Architect/Wipro	IBM Certified Information Server Administration 9.1 Wipro Certified Data Integration Design 4.1 Oracle Certified 11g SQL Tuning
Dharmendra Kumar Nagabhiru	Integration Lead	13	Cúram System Architect/IBM	Cúram Certified Developer

Name	Position	Years of Experience	Experience Level/Source	Certifications
Barbara Martz	Eligibility Policy SME (Part Time)	30	Senior Training Consultant/IBM	Cúram Certified Business Professional

Wipro/IBM's proposed key personnel collectively bring over 100 years of eligibility determination, case management, and claims management in health and human services. As shown in Table III-3, the personnel proposed to lead and support the Nebraska EES Project meet and exceed the recommended requirements for candidates. Wipro/IBM is proud to offer resources that combines related experiences such as State of Indiana, State of Maryland, State of New Jersey, State of Utah, State of North Carolina, and various Canadian provinces to provide the knowledge, skills, and understanding to successfully meet the needs of the State.

Table III-3: Key Resources Ability to Meet Recommended Requirements

Name of Candidate	State of Nebraska Recommended Qualifications				
	Consulting for Eligibility for 2+ Years	Experience in Design, Development, and Testing	Government or Public Sector Experience	In-depth Knowledge of ACA Regulations	Highly Developed Communication Skills
Shannon Glasscock	✓	✓	✓	✓	✓
Alex Livesey	✓	✓	✓	✓	✓
Anantkumar Kamalakar		✓			✓
Dharmendra Kumar Nagabhiru		✓	✓		✓
Barbara Martz	✓	✓	✓	✓	✓
Shashidhar Krishnamuthy		✓			✓

In addition to our key personnel, The Wipro/IBM team also brings an Advisory Panel to support the project activities and provide additional subject matter expertise around Cúram software, programs, Medicaid programs, and Health and Human Services. Wipro/IBM's Advisory Panel of Thought Leaders, consisting of Executive Health and Human Services Industry Leaders and Cúram SMEs, including Joseph Fiorentino, Partner for IBM Cúram Services, Paula Hildebrand IBM Cúram West Regional Manager, and Christi Oakley, Senior Project Manager for IBM Cúram will be available to provide leadership and guidance for critical issues that may arise, and insight from leading industry knowledge. After great consideration in carefully selecting the right personnel for this Advisory Panel for the State of Nebraska, Wipro/IBM is pleased to bring these resources as a value-added measure of differentiation of our capabilities.

Joseph Fiorentino

Joseph Fiorentino brings over 16 years of experience serving government and insurance clients working in a variety of delivery, strategy development, and consulting roles. Since 2005, Mr. Fiorentino has worked as part of IBM's Global Social Industry Team, which provides IBM's key focus on Social Security and social services, including subject matter expertise and solutions

development. In this role, he provides business support to clients and IBM teams around the world, contributes to the development of solutions, creates thought leadership materials, and presents at industry conferences. Mr. Fiorentino was the Global Social Services Lead for the IBM Government Centre of Competence. In this role, he was responsible for leading IBM's Business Analytics and Case Management solution portfolio and a worldwide team of Industry experts that are entirely focused on social security and social services at the federal, state, and local levels. Mr. Fiorentino also led the creation and deployment of a Social Industry Model – intended to be an international definition of business processes that is aimed at supporting citizen centric business models. The outcome of the work is driving a number of large scale business transformation projects primarily focused on process improvements, determining commonality across business processes, and implementing information systems aimed at improving service delivery.

Paula Hildebrand

Paula Hildebrand was the Cúram Account Executive for the State of Nebraska and is now the IBM Cúram Western Regional Manager. Paula has over 25 years of IT and state and local government experience with large IT organizations, like Hewlett-Packard, focused on systems integration. She joined Cúram Software Ltd. nine years ago as the Director for Cúram Global Services in North America. In her role as a project executive, Paula was responsible for the client engagement and service delivery teams in North Carolina, California, Indiana, New York City, Clark County Nevada, and New York State, participating in the explosive growth of Cúram. She has worked with multiple systems integration partners, many of whom were new to delivering Cúram projects. Paula is currently working with Minnesota on their Health Insurance Exchange and Medicaid Eligibility and with Missouri on their Medicaid project and case management projects, and continues to serve as the Cúram Executive liaison for North Carolina.

Steven Martin

Steven Martin has over 10 years of experience in the health and human services industry and over 15 years in large-scale technical system design, development and implementation. Steven serves as a Principal Technical Consultant and Senior Cúram Solution Architect with a focus on health and human services. Steven has served as a Lead Technical Solution Architect for Supplemental Nutrition Assistance Program (SNAP), Medicaid and other benefit program implementations at multiple clients including the State of Maryland, the State of North Carolina, the State of Utah and New York City. He has lead several architecture teams in the design of enterprise integration with Cúram into local, state and federal systems. Steven worked as a technical lead and architect for large IT projects for Fortune 500 companies before joining IBM.

Christi Oakley

Christi Oakley has over 20 years of experience in the human services arena, including product management, business process analysis, and large-scale system development and implementation. Ms. Oakley currently serves as Senior Product Manager and Subject Matter Expert responsible for defining the functional footprint of the IBM Cúram Healthcare Reform solution, with a focus on healthcare eligibility and enrollment. In her previous role, Christi worked as the product manager and principal domain expert for the IBM Cúram Income Support solution in support of Temporary Aid to Needy Families (TANF), SNAP, and Medicaid. Prior to joining Cúram Software, Christi

managed and consulted on human services IT projects in over 25 states, as well as with Federal, Tribal, and international government agencies.

2. State of Nebraska Staffing

Collaboration and coordination between the customer and the contracting team is a major factor contributing to positive outcomes and success for the Nebraska *SmartPro MedEE* implementation. The proactive inclusion of State of Nebraska employees and key staff in the full lifecycle of the project will promote and foster an environment of mutual trust and reduce risk through increased transparency. As such, the Wipro/IBM team has designed a project plan and project approach that includes the support and representation of key State of Nebraska personnel to help develop, manage, and support the EES transformation activities.

In constructing the detailed work plan for the project, Wipro/IBM estimates the personnel from the State of Nebraska that may be included in the design, development, and execution of project activities. Wipro/IBM's team's estimated staffing levels and hours requirements are included in Table III-4 below:

Table III-4: Anticipated State of Nebraska Key Personnel Requirements

Tasks	State Staff	Estimated Start Date	Estimated End Date	Estimated Hours
Conduct Project Kick-off Meeting	MLTC Project Manager, SMEs (3) (Audits and Appeals, Field Staff, Medicaid Eligibility Policy) , Project Stakeholders (2), Project Sponsor, IS&T Project Manager, IS&T Tech Lead	3/17/2014	03/17/2014	20.00
Conduct Meetings to Finalize Development Infrastructure	MLTC Project Manager, IS&T Project Manager, IS&T Tech Lead	3/17/2014	03/28/2014	16.00
MLTC Review of PSR DEDs	MLTC Project Manager, Project Stakeholders (2)	3/25/2014	03/25/2014	12.00
MLTC Re-review and Approval of PSR DEDs	MLTC Project Manager, Project Stakeholders (2)	04/03/2014	04/03/2014	6.00

Participate in Federal Certification Meetings (Optional)	MLTC Project Manager, Project Stakeholders (2), Project Sponsor	07/11/2014	08/08/2014	32.00

Key Staffing Level Descriptions

Wipro/IBM has built estimates into the overall project level of effort and project scope for the following positions to be held by State of Nebraska personnel:

Project Manager

The State will be requested to provide a project manager responsible for the governance and oversight of all project activities from the State. The State project manager will work closely with the Wipro/IBM project manager and other project leaders to track project schedules, complete and validate project deliverables, and manage all State resources assigned to the project.

Business Area SMEs

The State will be requested to provide a business subject matter expert for each individual business area related to the project. Typically for projects of this size and complexity, Wipro/IBM would anticipate the support of 4-5 full time business area SMEs. These individuals should be available as part of the project team full-time during the initial analysis phases, part-time during the design and development phases, and full-time again during the testing phase to support project outcomes, validate functionality, and help facilitate knowledge transfer. In addition to these core SMEs, it is anticipated that the State SMEs will have reach-back ability into the Division of Medicaid and Long Term Care (MLTC) to gather information and organize meetings with necessary stakeholders and involved parties (case workers and other related end user parties). The team recognizes that in order to build a culture of change and effectively gain buy-in for transformation, there is a need to involve groups and individuals outside of the core project team.

Infrastructure Architect

Wipro/IBM anticipates and has included estimates for the availability of an infrastructure architect as part of the State of Nebraska personnel involvement. The draft work plan estimates this person to be available part-time (50%) to support project activities throughout the duration of the engagement. This person must be skilled in designing technical architecture and have expert knowledge of the State's existing and desired infrastructure. The infrastructure architect will support the project team and Wipro/IBM's lead architect in the planning, design, and development of the State environment for the Cúram solution.

Data Center and Infrastructure Support

The Wipro/IBM Team anticipates the availability of Data Center and Infrastructure support staff from the State Data Center to be available for consultation during network and infrastructure build cycles and periodically thereafter to provide technical interface design validation to the Wipro/IBM Team during the DDI. We anticipate a variety of staff with expertise in network, interface and integration definition task to optimally integrate with external state systems.

Master Data Management SME

Wipro/IBM estimates the need for one full-time SME that will support the project team throughout the engagement to provide businesses and technical knowledge of State systems and business processes for the configuration and implementation of a Master Data Management (MDM) solution. This resource may provide support for the validation and configuration of hardware, provide subject matter expertise on Nebraska-specific MDM requirements and needs, assist in validating the proposed technical solution, and support the deployment of the solution. This will require knowledge of the Nebraska environment and the ability to support the development and implementation lifecycle for MDM Standard Edition.

Change Management Facilitator

Wipro/IBM will require an individual from the State to facilitate access to key stakeholders including senior leaders in the Department. This person will also help identify change champions and support their participation in a change champion network. Importantly, the lead from the State side will “own” the change management from within the Department, serving as the leader in championing change and providing expertise on the unique change needs of the State of Nebraska. The facilitator will help the project team with developing an understanding of client environment and facilitate access to State project leadership.

Communications Liaison

The project team will require the support of a part-time liaison to assist with communications, including the development and dissemination of communications. This is especially important for those groups (including external stakeholders and potential users) with whom the team will not directly interface. The communications liaison will be responsible for assisting with the development of the communications plan and identifying appropriate mediums for communicating with internal and external stakeholders. This role may also act as a part-time resource to assist the change lead in determining how project communications and other Organizational Change Management (OCM) related work products should be developed.

Change Champion Agents

The team will request the support of a number of Change Champions, one from each functional area (business unit, organizational grouping, stakeholder group, end user group), to commit 6-8 hours per month to act as communications leads for their area. Duties for this may involve translating communications down to each individual group to enhance their meaning and effectiveness for each area, identifying issues, and helping to develop messaging. Change Champions should be individuals who are not necessarily in a leadership position within their business unit, but may

represent a super user of the new platform or someone who is able to spur action and involvement within their functional area.

Training Liaison

The team will request a point of contact be available to act as a liaison for the activities surrounding the design, development, planning, and delivery of training modules associated with the project's change management efforts. This person may share time as the part time Communications Liaison, but will act as a facilitator for access to key stakeholders, and owner of training coordination with State representatives and end users. This person may also support the delivery and facilitation of training programs for beyond the duration of Wipro/IBM's implementation and stand up of the Cúram-based Eligibility and Enrollment Solution. The State's training liaison should possess strong leadership and presentation skills to effectively train users and related parties.

User Acceptance Testing

User acceptance testing activities will require a coordinator from the State with full time effort during this phase of implementation to coordinate the design of use cases, review of test results and meeting with the Wipro/IBM Team UAT staff for walkthroughs and define any re-test scenarios required.

Systems Integration Testing

Systems integration testing requires consultation from the State with respect to validation support and coordination with external systems to validate requirements, integration strategies and integration testing activities.

Maintenance and Ongoing Operations

Maintenance and Ongoing Operations activities requires support from the State to validate best practices for client reporting and oversight, scheduling, change and event management processes. The time commitment is expected to be less than 10% during DDI and less than 10% during ongoing operations and maintenance.

Shannon Glasscock, Project Manager

Employer History

2010 – Present Wipro Limited, Oregon
Senior Solutions Architect

Assignment History

05/2010 – Present Missouri Medicaid
Acting IT Program Director

- Leads enterprise solution design teams for the provider and payor healthcare market
- Architects enterprise level solutions to meet the needs of state and local governments, as well as commercial entities
- Acts as interim IT Director for Wipro's contract for the Missouri Medicaid project providing direction and accountability for all aspects of Missouri MMIS IT organization including successful delivery and regulatory compliance

Professional Experience Prior to Wipro Limited

04/2009 – 04/2010 Salem Tech Solutions
Project Manager
Oregon Department of Human Services

- Managed the team to create web-based food benefits, medical and TANF enrollment applications and a complementary caseworker application processing tool
- Developed overall custom development program projects sequence (scheduled with multiple iterations over several years) and obtaining approval from Program Executives
- Created individual project plans and schedules for each iteration including detailed WBS and task sequencing and effort estimating
- Created and maintaining and integrated project schedule
- Provided dashboard reporting and communicating project status at regularly scheduled district, working and executive steering committee meetings
- Leading project team daily standup meetings and weekly project status meetings
- Conducting lessons learned for the implementation of the first iteration to establish a baseline for continuous improvement
- Assisting the program manager by interviewing and selecting permanent key staff and their reports
- Served as acting Business Analysis Manager, Test Manager, co-Business Transition manager at various stages in the project as the team was being deconstructed and reconstructed due to a previous unsuccessful attempt to initiate the program

08/2005 – 04/2009 Oregon E-Government Program
Account Executive
Oregon Department of Human Services

- Managed contract to provide centralized E-government services to the State of Oregon agencies, boards and commissions
- Responsible for profit and loss (P&L), customer satisfaction, employee performance management and growing new business with client

08/2001 – 08/2009 EDS

Technical Delivery Manager
Oregon Department of Human Services

- Built and managed a team of software developers supporting the Oregon Department of Human Services Medicaid Management Information Systems application; focused on supporting Claims Processing (mainframe) and Eligibility (Web) Systems
- Oversaw the conversation and/or implementation efforts for several Health Insurance Portability and Accountability Act (HIPAA) transactions and National Council for Prescription Drug Programs (NCPDP) transaction set related to the MMIS proper and to various public health program that were being integrated into the MMIS

10/1998 – 08/2001 EDS

Systems Manager
Mississippi Title XIX

- Managed a team of up to 60 staff including mainframe and web developers, business analysts, and operations support staff
- Responsible for enhancing and maintaining the Medicaid Management Information System for on behalf of the Mississippi Division of Medicaid

08/1994 – 03/1997 EDS

Technical Supervisor
California Medicaid

- Managed a team of up to 17 developers responsible for enhancing and maintaining the California MMIS Claims and Financial subsystems
- Responsible for creating the first web-based system for the MMIS(enrollment and eligibility verification for a state-only program that was integrated with the MMIS)
- Implemented enhancements to the MMIS to support federal and state mandates

02/1989 – 07/1994 EDS

Systems Engineer
California MMIS

- Supported the Claims team with front end, claims adjudication, adjustments, and appeals
- Responsible for enhancing and maintaining multiple subsystems

Education and Background

- BS, Computer Information Systems and Business (Double Major), University of Puget Sound, Tacoma, Washington
- MS, MBA (concentration in Management Information Science), California State University, Sacramento, California

How State Recommendation(s) for Position is Met

Shannon has 25 years of experience providing services to public sector clients. Clients include State of California Department of Health Care Services (various technical and management roles with MMIS Fiscal Agent), State of Mississippi Division of Medicaid (Systems Manager for the MMIS Fiscal Agent), State of Oregon Department of Human Services (Project Management Contractor for Integrated Eligibility custom development project), and State of Oregon Department of Administrative Services (E-government Services Account Manager).

Experience with Proposed Software

- Multiple sales engagements with Cúram since 2006
- Onsite training with Cúram application supported by 25 years of industry and technical experience

Experience Relevant to Proposed Role

Proven experience with Consulting, Project Administration, and Technical Assistance for Commercial or State Government Eligibility Solutions for at least 2 of the last 4 years

Pre-sales solution development for multiple states and programs including State of South Carolina (MMIS), State of New Mexico (MMIS), State of Missouri (Integrated Eligibility)

Experience in the design, development, testing, and implementation of Medicaid or Commercial eligibility system

Project Manager for the development of an integrated eligibility application (Medicaid, SNAP, TANF, and Employee-Related Day Care)

Public Sector Experience

Twenty-five years of public sector experience as described above.

Other Relevant Experience

Not applicable

Provider Management and Financial Management. Responsible for designing the communication management component, which includes the integration with HP's Exstream product for PDF generation.

- Development team lead for all Medicaid rules development, which encompassed 32 different programs including CHIP, LIFC, Long Term Care and Aged, Blind and Disabled.
- Designed the Cúram Organization and Security structures
- Designed the customizations of the Cúram assessment scripts which collect data from clients in order to determine eligibility for benefits
- Designed and developed modules for Medicaid Presumptive Eligibility and Managed Care
- Technical representative at requirements validation sessions
- Assisted in the integration of Cúram with 30 systems including EBT and external eligibility systems
- Responsible for hardware and software configurations, including Requisite Pro, Oracle and Web Sphere
- Performed gap analysis to compare Cúram's functionality with over 1400 CASS requirements

From 04/2009 – 09/2009 Indiana Integrated Case Management System
Technical Lead

The Integrated Case Management System (ICMS) project supports the business processes of three agencies. The system uses the Cúram platform to implement Service Planning, Workflow, Provider Management, Intake, Eligibility, Financials and Communications as well as other case management functionality. Responsibilities included deploying the Cúram application and database and supporting the configuration of WebSphere and Oracle, requirements gathering, and creating and documenting an approach for migrating data from multiple legacy systems into Cúram

04/2008 – 04/2009 New York City HHS-Connect
Senior Technical Consultant, Technical Team Lead

Technical team lead for multiple initiatives that were built simultaneously as part of New York City's HHS-Connect project. Led the development of the first release of Worker Portal project in late 2008 and the ongoing development of the Client Portal project.

08/2005 – 04/2008 New York City ACCESS NYC
Senior Technical Consultant, Technical Team Lead

08/2005 – 01/2007 Technical Consultant

Alex worked with the project's system integrator, to provide a public-facing screening tool that will allow residents to determine their eligibility for 35 social service programs including Food Stamps, Medicaid, Child Care, Healthy NY, School Meals, Disabled Homeowner's Exemption and Head Start, along with many others.

Education and Background

- Bachelor of Science, Business Administration, Indiana University

How State Recommendation(s) for Position is Met

- Alex has extensive experience working with the MAGI and non-MAGI requirements for Medicaid implementations in both New Jersey and Maryland.
- Alex has over 10 years of experience with web-based, solution design, development, implementation and governance lifecycle experience. Most of his recent work had been done with the Cúram platform.
- Alex has performed as the Technical Architecture Lead for both the Maryland Health Insurance Exchange and New Jersey Consolidated Assistance Support System engagements, demonstrating his ability to perform this role on engagements of similar size and scope to the State of Nebraska EES Project.
- Alex's experience with the Cúram platform to design and develop and EES has been demonstrated through his last several engagements, including roles at the Maryland Health Insurance Exchange and New Jersey Consolidated Assistance Support System.
- Alex has spent the last 13 years working with healthcare, health and human services, and social services organizations in a variety of roles.

Experience with Proposed Software

Alex is a Cúram Certified Developer (CCD), a Cúram Certified Professional (CCP) and a Project Management Professional (PMP) with over 10 years of experience in building JEE applications including over 8 years of working with the Cúram platform. The Cúram certifications are for both technical and business analyst/functional roles.

Experience Relevant to Proposed Role

Proven experience with Consulting, Project Administration, and Technical Assistance for Commercial or State Government Eligibility Solutions for at least 2 of the last 4 years

Alex has worked extensively on projects involving case management and eligibility in the social services arena most recently in Affordable Care Act implementations.

Alex has nine consecutive years of working with government eligibility solutions using Cúram.

Experience in the design, development, testing, and implementation of Medicaid or Commercial eligibility system

Alex has served as the technical architect and technical lead for the implementation of Medicaid eligibility systems in Maryland, New Jersey, and New York City. In these roles, he has been responsible for the total solution development and end to end oversight of new or upgraded Medicaid eligibility systems.

Alex has five consecutive years of experience working in the design, development, testing and implementation of Medicaid eligibility systems in Indiana, New Jersey, and Maryland.

Public Sector Experience

Alex's public sector experience includes working with the states of Maryland and New Jersey over the last five years, as well as extensive experience with other state and local government agencies, including New York City and the State of Indiana.

Anantkumar Kamalakar, Test Lead

Employer History

1999 – Present Wipro Technologies
Senior Test Manager

Anantkumar has more than 13 years testing experience across multiple industry verticals such as, healthcare and pharmaceutical, finance, telecom, energy and utilities. He brings strong experience of test strategy creation, test plan development and test execution across multiple testing tracks, such as functional testing, system testing, integration testing, performance testing, regression testing and usability testing. His diverse experience on testing projects varies from mainframe based custom applications, windows based legacy application such as Lotus Notes to COTS testing of Oracle products.

Assignment History

09/2013 – Present Lane Bryant and Catherine's Plus
Senior Test Manager

Testing of legacy migration project. Creation of test strategy, test plan and test scenarios for migration of retail merchandising systems from mainframe to COTS products Oracle Retail Merchandising System and Oracle Retail Trade Management. Data migration and data load testing from legacy system to new COTS application.

04/2011 – 08/2013 Novartis Pharmaceutical, New Jersey
Senior Test Manager

Creation of test strategy, Test Plan, test environment and test data set-up for migration of Lotus Notes to SharePoint. Tracking and monitoring quality of testing deliverables for functional, usability, integration, compatibility, security and performance testing.

01/2010 – 03/2011 SSENG (APAC Migrations)
Scrum Master/Test Manager

Managing testing of project executed in agile methodology. Planning for testing in each sprint and managing testing risks on project to ensure delivery schedule adherence. Created user acceptance test plan and supported user acceptance testing on agile methodology.

01/2009 – 03/2011 Tokyo Stock Exchange, Tokyo
Test Manager

Managed the onsite QA team testing activities for functional and regression testing deliverables. Responsibilities included, creating test strategy, test plan and test cases for functional testing and system testing. Created testing status dashboard for tracking and reporting on progress and quality of testing.

Education and Background

- Bachelor of Engineering (Electronics and Communication) from Gulbarga University, Gulbarga

How State Recommendation(s) for Position is Met

Anantkumar has strong experience in creating test strategy and test plan for legacy migration projects. He has managed testing for two large mainframe to COTS product migration of IT application. He has managed functional, operational and performance testing of web-based SharePoint application migration from legacy Lotus Notes.

Experience with Proposed Software

Anantkumar has experience in using testing tools for functional, system, performance and automation testing proposed for EES project.

Experience Relevant to Proposed Role

Proven experience with Consulting, Project Administration, and Technical Assistance for Commercial or State Government Eligibility Solutions for at least 2 of the last 4 years

Anantkumar has managed two large legacy migration projects, which involved migration of mainframe based application functionality to COTS product and migration of Lotus Notes application to SharePoint based web application.

Experience in the design, development, testing, and implementation of Medicaid or Commercial eligibility system

None

Public Sector Experience

None

Other Relevant Experience

Regression and functional testing of mission critical telecom systems.

DataStage Architect and Technical Lead

- DataStage Architect
 - Fool Proof Technical Architecture and Design of ODS CRM migration of Oracle RDP to DataStage 8.1 on SMP architecture
 - Logical and physical data modeling of EDW for Star Schema Design in ERWIN
 - DDL script generation from ERWIN and deployment in Dev/UAT/Prod EDW database
 - Automation of production data migration; full load in DataStage
 - Automated job scheduling of ODS and leasing DataStage job using shell scripts and Oracle
 - Automation of Canada Calendar Implementation for job scheduling using shell scripts
 - Developed re-usable shell scripts for FTP, archiving, and validation of ODS flat files
 - Purging of historical data using PLSQL script
 - Implementation of auditing using DataStage routines
 - DataStage project migration to UAT and production DataStage
 - Environment and data warehouse sizing and storage estimation
- Technical Lead
 - Design and development of DataStage server, parallel and sequence jobs and shell scripts for real-time data warehouse using Netezza, stored procedures, and DataStage 8.1
 - Requirements gathering and effort estimation for 12 countries
 - Extensively implemented stages such as XML Input, Sequential File, Dataset, Lookup Stage, ORACLE Stage, Aggregator, Transformer, Copy, Merge, Join, Filter, Column Generator, Funnel, Peek, Change
 - Capture, Change Apply Stage, and several other stages for developing parallel jobs
 - Worked on assessment and DataStage Migration 8.1 to 8.5
 - Used Environment Variables, Stage Variables, and Routines for developing parameter driven jobs
 - Involved in designing source to target mappings between sources to operational staging targets
 - Implemented logic for slowly changing dimensions
 - Logical and physical data modeling of EDW Dimension and Fact Tables using ERWIN, DDL Script generation via ERWIN, and Deployment in Dev/UAT/Prod EDW data warehouse
 - Review of data stage jobs and documents and closing the comments
 - Performance tuning of ETL load execution time for XML parent child validation
 - Contribution to re-architecture of Connect+ accounting system
 - Transition to ADM Team for Country Wise Delivery
 - Utilized DataStage Director to run and monitor the jobs performed, automation of job control using batch logic to execute and schedule various DataStage jobs
 - Implemented the multi language support for Connect Plus system using DataStage, Oracle
 - Development of EDW Historical Data Purging PLSQL scripts

- Developed reusable SSIS packages to analyze daily load execution time reporting of Source System to OLAP Database
- Disaster recovery documentation for US Aix Servers
- Implemented IBM QualityStage Standardize stage for standardization of customer dimension data
- Oracle Partition Techniques for Oracle 10g Fact Table Partition

12/2004 – 12/2007 Shell Global Solutions, NL, UK
Application Consultant

Education and Background

- Bachelors of Engineering, Amrita University
- IBM Certified Solution Developer – InfoSphere DataStage v8.1, v8.5
- IBM Certified Information Server Administration 9.1
- Oracle Certified Expert, Oracle Database 11g SQL Tuning
- Wipro Certified Data Integration Design 4.1

How State Recommendation(s) for Position is Met

Shashidhar has been involved in large scale data migration projects at Cardinal Health, involving data related to pharmacy distribution.

Experience with Proposed Software

Shashidhar has used IBM Infosphere data stage extensively in his past projects.

Experience Relevant to Proposed Role

Proven experience with Consulting, Project Administration, and Technical Assistance for Commercial or State Government Eligibility Solutions for at least 2 of the last 4 years

Large scale data migration using similar tools as proposed for EES project.

Experience in the design, development, testing, and implementation of Medicaid or Commercial eligibility system

None

Public Sector Experience

None

Other Relevant Experience

Data migration experience on IBM platforms.

Dharmendra Kumar Nagabhiru, Integration Lead

Employer History

2000 – Present Wipro Technologies, Dublin
Senior Architect

More than 15 years of experience in IT including application architecture design, development, implementation, consulting, and administering on EAI, SOA, ESB, web services, client-server and Web applications in areas such as retail, telecom, mobile platforms, education, manufacturing, oil and gas plants, human resources, knowledge management, and business portals

Assignment History

02/2013 – Present Cardinal Health, Dublin, USA
Senior Architect

- Participated in requirements capture meetings with the business and various functional groups
- Provided architectural, technical, and functional expertise during any solution discussions
- Identified various integration solution options considering both functional and non-functional requirements and developed architectural approach/analysis/recommendation document and quality of service requirements document for the selected options and presented to the project workgroups and management

01/2012 – 12/2013 Lowes, Mooresville, USA
Senior Architect

- Defined the overall architecture framework for the IBM DataPower and its integration scenarios considering deferent kind of design patterns, protocols, data formats, and communication mechanisms with other applications and components
- Enforced best practices by implementing design patterns and integration scenarios in line with the Enterprise Architecture Strategy and Vision
- Designed solutions using Data Power components like WS-proxies, Multi Protocol Gateway, XML firewall , Web application firewall, SSL Proxy, AAA Policy and protocol like HTTPS/HTTP, MQ, TCP/IP, ODBC and Data formats like SOAP XML, Binary, fixed width and HTTP Get, REST and Database
- Designed integrations with legacy mainframe applications, enterprise applications (Sterling order management, PeopleSoft, Tax), Ecommerce Web application (Lowes.com) and implemented gateways to integrate with external vendors in a secured connection for processing payments, coupons, employee benefits, shipment and delivery.
- Provided architectural guidance, assessment, configuration steps, and engineering duties
- Developed best practices and standards to be followed during the implementation

10/2008 – 12/2011 Verizon Wireless, Atlanta, USA
Architect

- Participated in requirements capture meetings with the business and various ACI-IT groups

- Provide architectural and technical expertise during solution discussions
- Create architectural approach/analysis and QOS documents for the selected solution options
- Created system design, functional design, and technical design documents
- Defined the overall architecture framework for IBM DataPower, WBICS, and its integration scenarios considering different kind of design patterns and communication mechanisms
- Designed solutions using DataPower components like WS-proxies, Multi Protocol Gateway, XML firewall , SSL Proxy, AAA Policy, and protocol like HTTPS/HTTP, MQ, TCP/IP, ODBC, and data formats like SOAP XML, and Database
- Reviewed developer deliverables checking for quality and conformance to standards; notified developers of any quality or non-compliance issues
- Serve as architectural, functional, technical solution liaison for business and various ACI-IT groups

01/2005 – 01/2007 Alltel Communications, Atlanta, USA
Technical Lead/Architect

- System study, requirement and functional analysis, design, coding, testing, system administration, team management, communication, and coordination
- Designed Business objects and created ASBOs and GBOs using Business object designer
- Developed maps that convert data from the ASBO GBO format
- Created the collaboration template includes scenario and its activity diagram
- Created a collaboration object from the collaboration template
- Installation and Configuration of WICS, DB2, MQSeries, JDBC connector and Jtext connector
- Configured the data handlers required to convert between external formats

11/15/04 – 01/2005 Ispat Industries Ltd., India
Consultant
Internet and KM Portals

08/2003 – 09/2004 Petronas, Malaysia
Project Lead
CME for Melaka Refineray (EAI Project)

04/2003 – 06/2004 Dubai Government, Dubai
Project Lead
TECOM (Technology Electronic)

04/2000 – 04/2003 India
Module/Project Lead
B2B, B2E, B2C, Education, Project Management Portals,

07/1998 – 03-2000 India
Developer/Module Lead
Client Server Application Development/Tool Development

Education and Background

- Master of Computer Applications (MCA), India, 1998

How State Recommendation(s) for Position is Met

Dharmendra has knowledge on integration architecture to define and design the integration services, service reusability, and implementation of service in the technology selected for integration namely IBM Integration Bus (IIB), WSRR. The candidate is well versed with integration patterns and wide variety of implementation experience in integrating various A2A, B2B integration which makes him suitable for the role.

Experience with Proposed Software

The candidate has overall 15+ years of experience in architecting, designing, implementing the integration solution and has more than 7+ years of experience in IBM Message Broker (which is now known as IBM integration Bus), WSRR, B2B, and B2C type integration.

Experience Relevant to Proposed Role

Proven experience with Consulting, Project Administration, and Technical Assistance for Commercial or State Government Eligibility Solutions for at least 2 of the last 4 years

15+ years of experience with multiple commercial solution implementations for various Fortune 500 companies

Experience in the design, development, testing, and implementation of Medicaid or Commercial eligibility system

In depth experience in executing projects across all phases of Software Development Life Cycle with capacity of developer to senior developer, tech lead, architect and senior architect. Although the candidate does not have experience in Medicaid or commercial eligibility system implementation, but with wide range of experience in his career he is suitable for the role of integration architect for Nebraska Medicaid solution.

Public Sector Experience

Dharmendra has more than a year of public sector experience with Dubai Government, Dubai

Other Relevant Experience

Dharmendra has 14+ years of private sector experience.

Barbara Martz, Eligibility Policy SME

Employer History

08/2010 – Present IBM Corporation - Salt Lake City, Utah
Senior Business Consultant

Barbara Martz is a Senior Business Consultant within IBM Cúram Lab Services and a certified Cúram V6 professional. She has more than 30 years experience in health and human services.

Assignment History

02/2012 – Present State of North Carolina
Senior Business Consultant

The NC FAST project is state wide integrated income support system using Cúram's Global Income Support software which determines eligibility and benefits for Food Assistance, Cash Assistance, Traditional and Streamlined Medicaid, Children's Health Insurance Plans, and several state specific programs. Roles and responsibilities include:

- As lead business consultant for Medical Assistance design and implementation, providing Cúram support to policy specialists, analysts, developers, testers and trainers.
- Consulting with NC FAST project staff implementing Cúram for Health Care Reform software to meet the requirements of the Patient Protection and Affordable Care Act.
- Working closely with Cúram product development teams to modify out-of-the-box offerings to meet new NC FAST and federal requirements.
- Developing job aids to introduce and assist project staff in the use of the Cúram v6 online system.

11/2012 – 01/2013 Clark County, Nevada, Department of Social Services
Senior Business Consultant

The ACES project was a customization of Cúram software to provide a modern, comprehensive IT system to support eight assistance programs – financial and medical –for emergency and short term assistance to people in Clark County, Nevada. Roles and responsibilities included:

- Completing the business design for several emergency assistance programs using Cúram v6 software.
- Working closely with policy specialists to design user interface screens.
- Facilitating requirements sessions with Clark County Social Services staff to ensure that business designs met their needs.

05/2011 – 10/2012 Multiple North American Government Organizations
Product Consultant

During this period, Barbara assisted Cúram Sales with proposals and software presentations, focusing on the business functionality of Income Support (TANF, SNAP, Medicaid and CHIP), Citizen Self Service, Outcome Management, and Child Services. Roles and responsibilities included:

- Assisting with project proposals for several States' eligibility system RFPs

- Fit-gap analysis
- Written description of Cúram v.6 solution content and capability
- Analysis of Cúram for Medical Assistance MITA maturity level
- Providing product demonstrations of Cúram v.6 business functionality
 - Income support end-to-end demonstration from citizen online application to benefit issuance
 - Outcome Management demonstration including assessment, service planning and outcome evaluation
 - Citizen self-service demonstration of screening for need, screening for eligibility, online application and change reporting functionality

12/2010 – 04/2011 Ontario, Canada - Ministry of Community and Social Service – DSCIS
Senior Business Consultant

The DSCIS project was a customization of Cúram software to provide a modern, comprehensive IT system to support case management activities and service delivery to Ontario's adults with developmental disabilities. Roles and responsibilities included:

- Completing the business design for multiple screens to record results of needs assessment.
- Working closely with developers to construct and test the screens.
- Facilitated requirements sessions with Ontario ministry staff to ensure that screen design met ministry needs.

Professional Experience Prior to Cúram Software

12/2006 – 04/2010 TASH Networking
Lead Business Analyst
Data Conversion for Utah State eREP Project

Barbara was the lead analyst for data conversion from Utah State's public assistance legacy system (PACMIS) to eREP. She also served as a business analyst for adult Medicaid programs and federal interfaces (SDX, BENDEX, Buy In, SOLO) for the Cúram based eREP project.

09/2002 – 11/2006 State of Utah Department of Technology Services
Project Manager
Utah State's Public Assistance Management Information System

Barbara managed the IT team responsible for the maintenance and enhancement of Utah State's PACMIS project which determines eligibility and provides benefits for TANF, Food Stamp, Child Care, Medicaid and state medical and income maintenance programs.

01/1990 – 08/2002 State of Utah Department of Workforce Services
Lead Information Analyst
Utah PACMIS System

Barbara was the lead business analyst for PACMIS, Utah's income maintenance system.

09/1974 – 12/1989 State of Utah Assistance Payments Administration
Eligibility Processing Coordinator

Barbara began her career with Utah as an eligibility worker and was soon promoted to the supervisory position of a team of twelve eligibility workers. Her team was responsible for eligibility and issuance of 1500 financial, medical and food stamp assistance cases. Barbara initiated computer system enhancements to benefit agency operations for income maintenance programs.

Education and Background

- M.A. Public Administration, University of Utah, June 1999
- B.A. History, University of California - Irvine, June 1972

How State Recommendation(s) for Position is Met

- Barbara has spent nearly thirty years working with eligibility determination and eligibility programs at the state level, highlighted by her extensive experience with the State of Utah.
- In addition to eligibility determination, Barbara's experience includes work with TANF and SNAP programs, combining the state and federal assisted population coverage into her extensive IT and Social Services work.
- As a Senior Business Consultant for IBM Cúram, Barbara has worked with multiple North American government organizations in the last several years to assess systems and design solutions that meet the changing demands of the space, including such programs as the PPACA and MITA through her present assignment with North Carolina, where she is consulting with NC FAST project staff implementing Cúram for Health Care Reform software to meet the requirements of the Patient Protection and Affordable Care Act.

Experience with Proposed Software

Barbara has over 6 years of experience with Cúram software. This includes three years as a business analyst for Utah's Cúram eREP project. Her Cúram experience includes the ability to perform fit-gap analysis and as well as implementation and migration from legacy systems to the Cúram platform.

Experience Relevant to Proposed Role

Proven experience with Consulting, Project Administration, and Technical Assistance for Commercial or State Government Eligibility Solutions for at least 2 of the last 4 years

For the last four years, Barbara has worked with multiple government organizations across North America in consulting, sales, project leadership, and technical assistance, including various roles in Canadian provincial government organizations, and with the State of Utah.

Experience in the design, development, testing, and implementation of Medicaid or Commercial eligibility system

Barbara's experience includes nearly 30 years of work with eligibility systems and programs. She has extensive experience as a manager and business analyst in all of the State of Nebraska's recommended areas as an expert in eligibility.

Public Sector Experience

As a subject matter expert, Barbara brings nearly 30 years of experience working in and consulting for public sector organizations in North America. Her extensive state and provincial experience has provided her a deep understanding and expertise in eligibility systems and the unique requirements of public sector organizations.

Resume References

In addition, at least three (3) references (name, address, and telephone number) who can attest to the competence and skill level of the individual.

J. SUBCONTRACTORS

Wipro/IBM will be comprised of prime contractor Wipro LTD. and subcontractor International Business Machines Corporation (IBM). The team brings proven Eligibility Software Solutions, experience in State and Local Government, Medicaid and complex integration project expertise to successfully meet the State's business needs. Having partnered successfully with IBM, Wipro is one of only a few IBM Premier Global Systems Integrators. Wipro and IBM enjoy a 20 plus year relationship and history of partnering to deliver exceptional capabilities and value for customers across multiple practice areas including hardware and software deployment and enterprise integration.

Provided below is information pertaining to the subcontractor firms for this engagement:

Table III-6: IBM Contact Information

Subcontractor Contact Information	
IBM Headquarters IBM Corporation 1 New Orchard Road Armonk, NY, 10504-1722	IBM Nebraska Contact John Martenev IBM Corp. Client Executive – State of Nebraska 6825 South 27th Street Lincoln, NE, 68516 Office number: 1-316-207-5048 jdmartenev@us.ibm.com

Specific Tasks for Each Subcontractor

As a Wipro/IBM team member, IBM will support the project to construct a modern COTS-based Eligibility and Enrollment Solution that meets the State's requirements and the CMS Seven Standards and Conditions.

IBM will provide expert support and collaboration as a full partner with Wipro in all phases of the construction and deployment of *SmartPro MedEE* solution using the IBM Cúram as the base. Table III-7 details the staffing levels for the Wipro/IBM team in each phase, indicating the size of each projection function relative to its maximum team size during each phase of the project.

Table III-7: Staffing Levels as Percentage of Full Sub-Team Hours by Phase

	Planning	Design	Development	Testing	Deployment	Warranty
Management Oversight						
Cúram Solution Development						
Organizational Change						
Training Development						

Wipro/IBM estimates IBM supporting the delivery of the project in the following key task groupings:

Executive Oversight and Project Management

Percentage of Hours Estimate: Wipro/IBM estimates that the project management office functions performed by IBM will require 11.58% of subcontracted performance hours to undertake and complete.

As part of Wipro/IBM, IBM will provide and actively participate in project leadership and management to assist in the governance of the project and support the efforts across the team. This effort is expected to occur across all phases of the program, from the planning phase through deployment in order to support the effective and functional delivery of the Cúram solution for the State of Nebraska.

Design

Percentage of Hours Estimate: Wipro/IBM estimates that the design tasks performed by IBM will comprise 16.10% of subcontracted performance hours to undertake and complete.

IBM will provide personnel to support the requirements analysis phase, which includes the core business process reengineering analysis and design, Cúram business rules design, and Cúram configuration components. The design phase and the personnel associated with the activities in this phase will include conducting extensive requirement analysis with subject matter experts and other key stakeholders from the State to perform a fit gap against the core functions of the Cúram platform to determine the specific business rules and unique attributes of the State's business environment. Additionally, it is estimated that IBM technical specialists, including the Cúram Architect, will support technical analysis to better understand the State's IT environment and requirements to support the Cúram-based solution.

Development

Percentage of Hours Estimate: Wipro/IBM estimates that the development tasks performed by IBM will comprise of 49.27% of subcontracted performance hours to undertake and complete

The largest component of the project will be the technical development of the solution. Tasks associated with this phase include development and coding, security testing, unit testing, interface development from both the Cúram and Master Data Warehouse (MDW) sides, and any custom developments associated with the solution design to support the State's requirements. This phase leverages the business process reengineering study and stakeholder input to effectively build a solution specific to the State's goals for business operations and its business environment.

Organizational Change Management

Percentage of Hours Estimate: Wipro/IBM estimates that the organizational change management tasks performed by IBM will comprise of 8.72% of subcontracted performance hours to undertake and complete

IBM will provide support to the State for organizational change management tasks including the development and facilitation of communications that support change around business processes, technologies, and business rules associated with a new Eligibility and Enrollment Solution. This may also include working with key stakeholders to establish change materials provided to external stakeholders that interface with the system, or are impacted as a result of the upgrade to a modern Eligibility and Enrollment Solution.

Training

Percentage of Hours Estimate: Wipro/IBM estimates that the training tasks performed by IBM will comprise of 14.34% of subcontracted performance hours to undertake and complete.

IBM is estimated to provide support to the project team and the State in the areas of development and facilitation of training, including the delivery of modules associated with system changes and new business processes.

Percentage Of Performance Hours Intended For Each Subcontractor

As the sole subcontractor for Wipro/IBM, IBM personnel will contribute 35-40% of performance hours associated with the contract. IBM personnel will both lead and support key project activities as members of Wipro/IBM. We estimate the tasks associated with the components as listed above will require 45k plus hours to complete.

Total Percentage Of Subcontractor Performance Hours

As the sole subcontractor and partner on Wipro/IBM, all subcontractor hours are associated with IBM. IBM will provide resources to support and/or lead certain functions and task throughout the

life cycle of the project. We estimate the IBM resource staff-contributions to the project represents 10% to 15% of the total number of hours projected in our work plan. IBM's contributions to this project are more than the distribution of hours in the work plan. IBM staff hour contributions are packaged within hardware and software product deployment and implementation, which are not reflected in hours calculations.

Proposal to Provide Nebraska Medicaid Eligibility and Enrollment Solution

Prepared for:

State of Nebraska Administrative Services
Material Division Purchasing Bureau

Submitted in Response to RFP: 4544Z1

Technical
Approach

IV. Technical Approach

A. *UNDERSTANDING OF THE PROJECT REQUIREMENTS*

The technical approach section of the Technical Proposal must consist of the following subsections:

a. *Understanding of the project requirements;*

In March 2010, the Patient Protection and Affordable Care Act (ACA) and the Health Care and Education Reconciliation Act of 2010 were signed into law. ACA requires states to implement a streamlined Medicaid eligibility process which collapses existing Medicaid categories, streamlines the application process and employs the simplified Modified Adjusted Gross Income (MAGI) standard for a significant proportion of the population. In addition, the regulations call for a coordinated process by which individuals may apply for and receive an eligibility determination for Medicaid on a MAGI, non-MAGI basis or for Advanced Premium Tax Credits (APTC)/Cost Sharing Reductions (CSR) of premium payments for insurance coverage purchased via an exchange.

Nebraska's existing Medicaid system, N-FOCUS, has been in operation for approximately 20 years. Per our conversations with Nebraska, the system is difficult to modify, requiring skilled developers who are knowledgeable with N-FOCUS. The tools used in N-FOCUS are older technology and there are few skills available on the market to support the system. While N-FOCUS provides integrated eligibility and a common case management environment, it does so in a restrictive way, forcing the MTLC to wait, sometimes unacceptable amounts of time, for their specific requirements to be prioritized for implementation. N-FOCUS was a custom built system, built by a system integrator (SI) and maintained by the SI for a long period of time. Adding the new federal requirements to the system has been challenging. Further, N-FOCUS does not lend itself to integration with online portal technology. Citizens can apply on line but their information must be rekeyed into N-FOCUS to complete the application process. Finally, there is no support for tablet or smart-phone technology, for either the citizens or the State workers.

Instead of attempting to modify the existing solution, the State of Nebraska has decided to undertake the implementation of a new modern system to meet the federal requirements introduced by the ACA and also provide additional benefits to MLTC. The State needs to implement a system that will allow them to maximize currently available federal funding matches. The right solution will enable the State to take advantage of the technology advancements introduced in the past 20 years while also meeting the complexities introduced in the ACA.

At a high level, the Division of Medicaid and Long Term Care (MLTC) requires a commercial off the shelf (COTS) Eligibility and Enrollment Solution (EES):

- Designed around a well thought-out, efficient set of business processes needed to support eligibility and enrollment in public benefit programs;
- Built around a strong, fundamentally sound set of eligibility and enrollment processes;

- Allows administrative users to easily update eligibility rules and other key system functions, without programming changes, will allow the Division to run a more nimble and responsive program at a lower cost than N-FOCUS;
- Allows self-service for clients who prefer to do as much as they can on their own via different modalities such as online and phone;
- Facilitates easy access via methods such as, having a client's representative act on their behalf; allowing an eligibility worker to provide application support; or allowing the client to be serviced in person, on the phone, or via paper;
- Takes advantage of advances made in reporting and business intelligence over the last 20 years. Providing the ability to produce "canned", parameter based reports on a routine schedule or on demand, as well as, ad-hoc reports as desired;
- Provides additional power for users, but with less training;
- Demonstrates a sound long term investment and efficient use of tax dollars for Nebraskans.

Additionally, the State must complete the implementation of the new solution by December 31, 2015 to maximize federal funding.

The Wipro/IBM team proposes a (COTS) Eligibility and Enrollment Solution that will support Nebraska's business needs and complies with the MITA Technical Architecture and CMS Seven Conditions and Standards, as described in the table below:

Table IV-1: *SmartPro MedEE* Complies with MITA 3.0 and CMS' Standards

Technical Service Classification	Technical Capability Descriptions
Client Support (Business Results Condition)	<p>Cúram performs at Level 3 and provides support for some elements of Level 4.</p> <ul style="list-style-type: none"> • Cúram supports the following browsers: IE 8, 9, and 10, Google Chrome, Apple Safari 5.x, Mozilla Firefox • Beneficiaries have access to Cúram Universal Access (single online access point) for benefit information. • Providers have access to Cúram Provider Management portal (single online access point). • Cúram for Medical Assistance provides application integration with the Cúram Health Insurance Exchange solution.
Business Intelligence (Business Results Condition and Reporting Condition)	<p>Cúram provides support for Level 3 through the following capabilities:</p> <ul style="list-style-type: none"> • The Business Intelligence infrastructure of Cúram uses 'Business Intelligence and Reporting Tools (BIRT)' to render the charts and dashboards targeted at specific stakeholders. • The Cúram Supervisor Workspace provides decision makers with dashboards, heat maps and color-graded graphs to monitor program usage and expenditures, develop future budgets and staffing plans, prioritize issues, and manage and balance work and caseloads. . • Cúram provides capabilities to extract data into prebuilt data marts for analytics purposes.

Technical Service Classification	Technical Capability Descriptions
Forms and Reporting (Business Results Condition and Reporting Condition)	<p>Cúram performs at Level 4.</p> <ul style="list-style-type: none"> • Cúram uses electronic forms to capture information from users. These electronic forms are comprised of a mixture of guided questionnaires and forms based JSP/HTML pages. • Cúram supports binary format attachments such as MS Word, Excel, and PDF. • Providers can submit roster and service invoices via the dedicated Provider Self-Service portal or by directly to agency through formatted record files. Scheduled batch jobs will access and process provider invoices.
Performance Measurement (Reporting Condition)	<p>Cúram provides support for Level 4 through the following capabilities:</p> <ul style="list-style-type: none"> • Performance measures and criteria, associated with the provider’s service offerings configured are configurable through the Cúram Administration Suite Updates to provider contracts facilitates the Department’s ability to monitor provider contract-related performance. • Configurable alerts monitor milestone status and achievement and are used to notify designated staff responsible for taking appropriate actions in accordance with Department policy and protocol.
Security and Privacy (Industry Standards Condition)	<p>Cúram provides support for <u>Level 2/3</u> through the following capabilities:</p> <ul style="list-style-type: none"> • Client access available via web browser, kiosks, and mobile devices. • Cúram web pages can be displayed using common mobile micro browsers. • Cúram can be configured to be part of a Single Sign-On (SSO) session.

SmartPro MedEE will incorporate the new Medicaid rules and interface with the Federal Health Insurance Exchange. Utilizing a proven solution, with extensive out-of-the-box functionality designed specifically to support Medicaid programs, reduces risk and enables Nebraska to take advantage of the best practices built into the solution. Further, Nebraska will be able to leverage project artifacts as appropriate from other states implementing IBM Cúram for both their MAGI and non-MAGI projects.

Over time, if a decision is made to move from the FFE to a State Exchange model, *SmartPro MedEE* provides a flexible solution to support that decision. IBM Cúram provides capabilities for integrating with a State Exchange including the Rules logic for Advance Premium Tax Credit and Cost Sharing Subsidy calculation and shopping portal integration with best of breed insurance shopping portal vendors. Furthermore, the IBM Cúram provides a complete portal solution for capturing changes in circumstance.

Nebraska and the federal government require sharing of project artifacts for federally funded projects with a goal of not re-creating what has already been done in another state. A COTS project provides a unique opportunity for reuse and collaboration. Today, North Carolina has shared their project

plan, best practices, and lessons learned with several other states and is willing to share similar project design documents, project plans, configurations, and extensions to IBM Cúram with Nebraska. Currently, Maryland, North Carolina, Washington DC, South Carolina, Indiana, Minnesota, and Arkansas participate in an IBM Cúram user group which hosts regular conference calls and updates from IBM Cúram product development as well as facilitating communication between the states on project accelerators and best practices.

Successful deployment of a new system requires effective project management including plans that address architecture, configuration management, project change management, training, organizational change management, and security requirements. The State requires a system that has been thoroughly tested with a structured plan that includes unit testing, integration testing, and user testing. Plans should address business process re-engineering, organizational change management, user training, and help desk. Because the system is mission critical, plans must address business continuity and disaster recovery services. Meeting CMS standards for effective software deployment will be of critical importance as prerequisite to achieving certification.

Essential to meeting these targets are effective project plans that include key deliverables, milestones and dependencies. Nebraska recognizes the importance of project governance, decision-making and risk management strategies in meeting deadlines.

The Wipro/IBM team is prepared to work with the State to implement the system on time. The Wipro/IBM team is also prepared to support Nebraska in its efforts to meet the complexities and challenges of implementing additional aspects of the Affordable Care Act by supporting the streamlined workflows and processes, business-friendly rules, and automation to address the additional caseload due to the potential expansion of Medicaid.

To meet the State’s requirements, the Wipro/IBM team proposes to use the IBM Cúram commercial off-the-shelf software (COTS) solution as the foundation for Nebraska’s EES Project. Cúram will meet the functionality requested in the RFP as well as the State’s vision for an efficient, compliant, customer-centered solution. In sections of this proposal, we will present our understanding of the requirements and describe how our solution will provide the requested functional and non-functional components.

The core functional components include:

Table IV-2: Core Functional Components of the EES

EES Functional Components		
1. Presumptive Eligibility	1. Enrollment/Renewals	1. No Wrong Door Policy (Application Pathways)
2. Registration	2. Case Review Quality Assurance	2. Changes to Beneficiary Information
3. Application Intake and Processing	3. Outreach and Notifications	3. Performance Management
4. Determine MAGI and non-MAGI Medicaid Eligibility	4. Workflow	4. Audit Trail
5. Caseload Management	5. Master Person Index	5. Organizational Change Management
6. Spousal Impoverishment Assessment	6. Reporting	6. Business Process Reengineering
	7. Policy Management	7. Documentation
	8. Public Self-Service Portal	

The core non-functional components include:

Table IV-3: Core Non-Functional Components of the EES

EES Non-Functional Components		
1. Infrastructure Design, Installation, Testing, Implementation 2. Software Installation, Testing, Implementation 3. Software Configuration, Testing, Implementation	1. Interface Design, Development, Testing, Implementation 2. System Integration, Testing, Implementation 3. Technical Support Services 4. User and Technical Training	1. Post-Implementation Maintenance and Operations 2. Data Conversion and System Migration 3. EES Pilot, if applicable 4. Turnover

IBM Cúram Social Program Management

Leading analyst firms have recognized IBM Cúram as the global leader in commercial off-the-shelf software (COTS) solutions for the Social Enterprise Management (SEM) market. IBM Cúram has the largest health and human services development organization in the world and with its exclusive focus on health and human services is able to deliver unparalleled innovation and enhanced usability for its members. The Wipro/IBM team offers Nebraska a flexible, scalable integrated eligibility solution that will accommodate the evolution of healthcare reform and Medicaid.

IBM Cúram delivers the benefits of a COTS solution, including comprehensive out-of-the-box functionality, documentation, ongoing technical support, product maintenance, and continuous research and development. However, unlike other COTS solutions, IBM Cúram has been designed from the beginning to meet the unique needs of social enterprise organizations and to address the challenges you face. This singular focus differentiates Cúram from other vendors' product offerings.

IBM Cúram enables organizations to implement scalable, robust software solutions that are feature rich, user friendly and highly flexible. IBM Cúram is built on a Java Enterprise Edition (Java EE) architecture that is SOA compliant and facilitates incremental implementation strategies. Additional Cúram components – built on a common foundation – can be added over time to enable agencies to adopt a seamless, enterprise-wide solution.

IBM Cúram provides formal, regular training classes that can be held privately or are publically available with a certification program for both the technical and business level professional. There is also a large population of systems integrators and smaller firms available to assist the State in the future with on-going maintenance and modernization efforts. Nebraska will not be dependent on the expertise of just one SI for future enhancements and implementations.

Finally, a key advantage of the IBM Cúram program is a published roadmap that includes regular enhancements based on client feedback, technology trends, and research in the health and human services market. There is also a substantial product development organization to support the Wipro/IBM team with patches and product updates should they be needed as well as having close communication with the Wipro/IBM team on project related issues. With ten other states using the

same COTS product, it is likely that any issues in the product have been addressed by another project team.

Data Conversion

“Data migration/conversion is more than moving data into a new application; it’s about making the data work within the new application”.

Data is an immensely valuable asset of Nebraska and must be managed carefully so as not to lose or diminish the value. This is especially true in health and human services. The data is the foundation for many core applications and processes which in turn have significant impact on welfare and proper care of Nebraskans.

Based on our experience handling complex data migrations, we understand what is necessary for a successful migration and appreciate the impact of a failed migration.

For successful rollout of **SmartPro MedEE**, Wipro/IBM proposes to use its patented 'Data Migration Factory' solution underpinned by a strong enterprise information framework, solution accelerators, flexible and execution model approach to manage Data migration requirements for the State of Nebraska. Wipro’s patented Data Migration methodology precisely captures the learning over 140 data migration programs. Key components of our solution are:

- Data migration framework, methodology, Reference Architecture, templates and other reusable assets to streamline the migration process and enable tool based automated migration
- Wipro’s Information platform, a web based application developed for enabling Information Management processes with features like data governance, collection, profiling and cleansing, and mapping.
- Flexible resourcing model wherein Core team takes care of requirement analysis, solution definition and designing supported by a pool of flex team.

Data Migration is the process in which data from different source systems (N-FOCUS and others) will be extracted based Cúram Application Operational DB (DB2), Data Warehouse and historical data requirements. Extracted data will be cleansed, transformed, validated and reconciled by embedding business rules, Cúram data model and other relevant transformation rules and finally uploaded into **SmartPro MedEE** using load utilities.

Business Intelligence and Reporting

To meet the State of Nebraska’s reporting requirements (functional as well as non-functional) and enable ad-hoc reporting and analysis and meet future reporting requirements, Wipro/IBM proposes to build 45-50 Operational and Analytical Reports and approximately 5 Dashboards using Cognos. The reporting or information delivery layer will integrate with **SmartPro MedEE** and ensure all the business users are leveraging the best in breed KPIs, Analysis, Data Visualizations, etc., as well as ensuring all the operational and compliance reports under the Eligibility system are covered.

Considering the current spectrum of analytics and operational reporting needs of the State; it is highly recommend having a single BI environment which can address the current needs including; dashboards for the senior and middle management team, and operational reporting to support the day-in and day-out decision-making, and state and federal reporting requirements. It is also advised to have a BI environment which can fulfill the State's vision of a mobile-based BI system to deliver reports on handheld devices like tablets, smartphones etc. if required.

Wipro/IBM recommends using Cognos BI. Cognos BI will also allow the State super users to rapidly create custom reports by picking up appropriate KPIs which will be built as a part of the semantic layer. It will allow users to have greater agility to meet the on-demand BI needs.

On top of the new system and the Cúram data marts, Wipro/IBM will create an additional two to three data marts which will hold all the data required for reporting. DataStage will be used as the ETL tool and the Wipro/IBM team will model the data mart in such a manner that most complex transformations, summary tables etc. are created at the data mart level itself.

Master Data Management

The **SmartPro MedEE** solution is based on the market-leading data integration tool, IBM InfoSphere Master Data Management (MDM). At the core of solution are centralized indexes (one for clients and another for service providers) that reliably cross-link identities thereby building a secure and trusted single view of critical client and provider data. By providing the State the ability to uniquely identify essential data elements across systems without the need of normalizing the underlying legacy systems or content, the **SmartPro MedEE** solution provides the comprehensive client information necessary to improve quality, reduce costs and achieve outcomes.

IBM is a leader in MDM with a successful history of more than 18 years and with more than 800 clients including those of similar size and structure to the State. This industry-leading product was recognized in Gartner's most recent Magic Quadrant for MDM of Customer Data Solutions shown below.

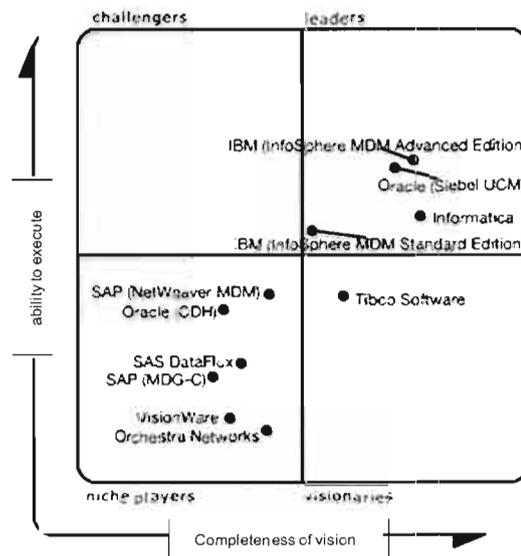

Figure IV-1: Gartner's Magic Quadrant for MDM of Customer Data Solutions, October 2012

Wipro/IBM's point of view on MDM is a top down approach starting from Data Governance strategies progressing to the physical implementation using tools and technologies.

The building blocks of an MDM implementation are illustrated below.

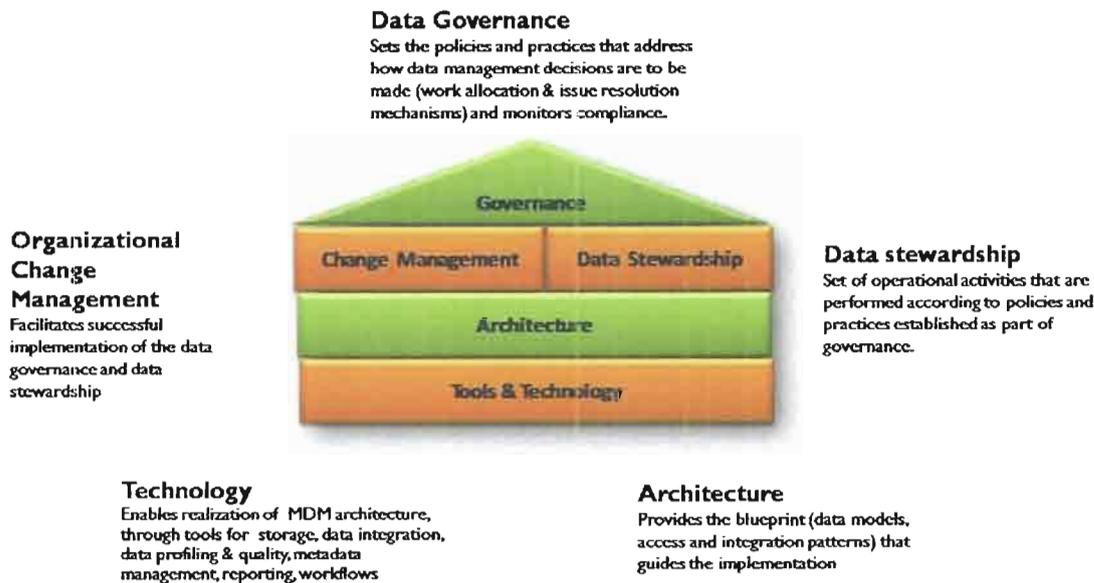

Figure IV-2: MDM Building Blocks

The Wipro/IBM framework for data governance encompasses the enterprise context with its constituent business processes and capabilities which dictates the data governance strategy. The data governance strategy will have a clear charter, principles, practices, policies and standards. This will be evolved as a management program jointly with all business and IT stakeholders during the initial phases of the project.

Organizational Change Management

The best technical project in the world can fail without attention to organizational change management. If the end users are not ready and receptive to the change and executive sponsorship is lacking, projects are doomed to fail. No matter how much the current system lacks in capability, it is familiar, much like a comfy chair that really needs recovering or replacement. Our team will focus on making the users comfortable with the change from the beginning by implementing the following processes:

- From the beginning of the project, we will have a communication process that includes the end user community, giving them updates on what is happening with the project and what to expect and when. We suggest that the communication be a joint one with participation and support by the Nebraska executive leadership.
- We will demonstrate the standard functionality of the *SmartPro MedEE* solution to the end user community at the beginning of the project and at mutually agreed checkpoints so that they are not surprised by functionality and can provide feedback.
- We recommend participation by caseworkers and State workers in the requirements confirmation and design sessions. These individuals will then serve as ambassadors for the project.
- Training of the user community and development of training materials that are tailored to the users' role.
- Creation of a help desk and tiger team during the project go live process. The tiger team will be composed of State caseworkers and project team staff. The tiger team is designed to work through the issues of implementing a new system quickly to minimize the frustration that users may experience with change.
- Creation of an incremental rollout plan so that modifications to the change management process can be made as needed.

B. PROPOSED DEVELOPMENT APPROACH

The Wipro/IBM approach, *SmartPro MedEE*, is specifically designed to deliver on five key values:

- The right functionality;
- Delivered quickly and on-time;
- Of high quality as understood by its stakeholders;
- With stakeholders fully prepared; cost effectively; and
- Prepared for the future.

SmartPro MedEE is the IBM Cúram-based solution packaged with integration services, reporting, master data management, and other components to meet the requirements of Nebraska. It is designed using the COTS IBM Cúram solution as its foundation and central integration hub. While sub-sections below provide detail on how we will approach and deliver on these and other values to the State, we outline the whole approach here.

Nebraska's Enterprise-ready Medicaid Eligibility and Enrollment System

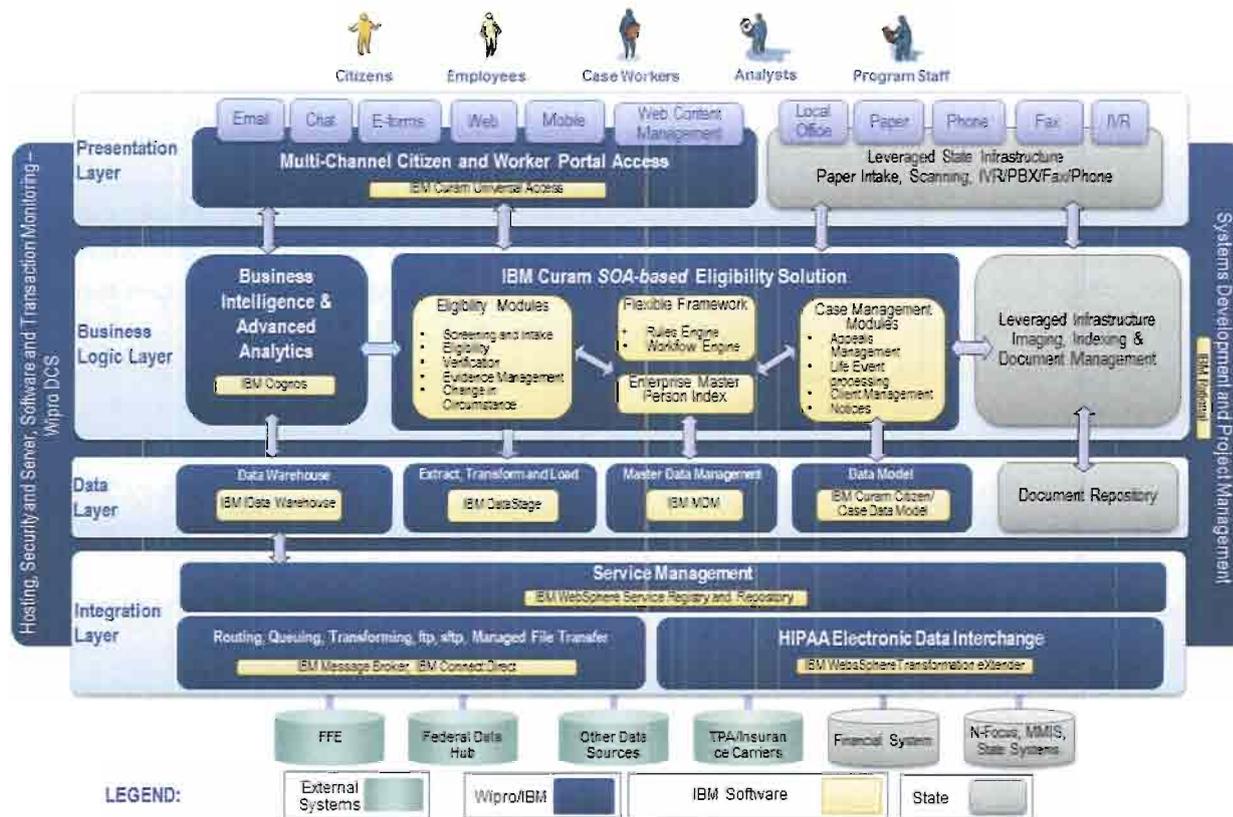

Figure IV-3: Nebraska's Enterprise-Ready Medicaid Eligibility and Enrollment System

Right Functionality

The success of the Nebraska EES depends upon the solution matching the business and non-functional needs of the MLTC. *SmartPro MedEE* is built on IBM Cúram, one of the most widely implemented and successful COTS packages available today for Medicaid eligibility and enrollment. IBM Cúram is the only COTS package in the market that is built specifically for health and human services and meets the federal guidelines for COTS. It should be noted that the federal definition of COTS states that multiple integrators must be able to implement the COTS solution and it must be made available commercially to multiple integrators.

An eligibility and enrollment system must also provide for the change in circumstances of its managed population and must be able to check eligibility and calculate benefits based on a specific period in time. Medicaid programs are complicated and each state has specific requirements so the associated rules engine must be easy to configure and existing Medicaid rules need to be easily modified to support Nebraska's Medicaid programs. We will share artifacts from other projects for those Medicaid coverage types that are appropriate to Nebraska, leveraging other state's configurations for a more rapid implementation with lower risk and costs.

As Nebraska is fully aware, core eligibility and enrollment processing is not enough; a successful EES requires easy access to the information created and maintained by the eligibility and enrollment

system, ranging from mainstream reporting, through ad-hoc queries and advanced analytics. *SmartPro MedEE* fulfills this need by building upon one of the most common and successful Business Intelligence platforms available today: IBM Cognos.

Last, eligibility and enrollment systems require a strong Internet Portal capability available to citizens, to provide them simple and effective access to the information and support they need, through the communications channel and media format most effective for them. *SmartPro MedEE* leverages the IBM Cúram Universal Access portal to provide citizen access, potential eligibility determination, no touch eligibility determination when appropriate, and application submission with seamless integration to the caseworker for more complicated eligibility determination and case management. As IBM Cúram is a web based application, the caseworker will have a worker portal to manage their day to day case management responsibilities.

Non-functional support

SmartPro MedEE is architected based on modern application precepts, such as Service Oriented Architecture, rules engine abstracted outside of code, and hardware/environmental virtualization. It is also built upon an extremely scalable hardware/software appliance, the PureApp server. *SmartPro MedEE*, and all of its environments, is being implemented on two 64-processor PureApp servers: one for the primary data center, a second for the secondary (DRR) site. Without changing boxes, each server can be upgraded in-place to nearly 10 times its initial compute capacity and memory configurations, providing nearly unlimited potential for future growth. Figure IV-4: Proposed Production Infrastructure below provides an overview of the proposed production infrastructure.

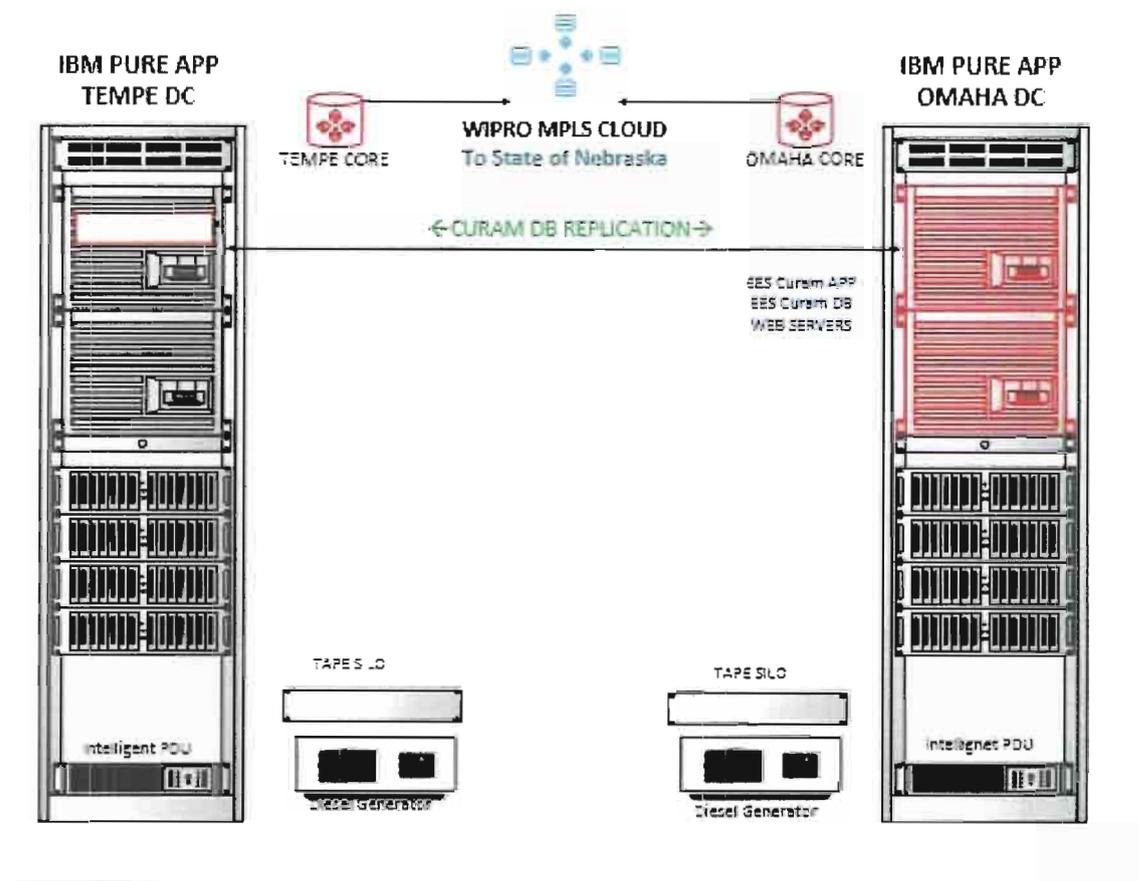

Figure IV-4: Proposed Production Infrastructure

The SOA architecture supports interoperability, scalability and, by avoiding single points of failure provides for high availability and resilience. It is fully compliant with the State's non-functional requirements as detailed in the traceability matrix.

SmartPro MedEE is built upon IBM's PureApp server, a fully integrated web and cloud-ready hardware and software appliance. PureApp encompasses highly scalable hardware (IBM Power+ series), Operating System (AIX), Database (DB2 Enterprise), Application Server (WebSphere ND), virtualization, and monitoring/management in a single pre-integrated and certified whole. By implementing pre-defined and certified patterns such as 3-Tier Web Application or Cognos Business Intelligence, PureApp servers can make integrated and certified application environments available within less than a day from the delivery of the box, and supports configuration of virtualized environments within moments. This level of integration eliminates a large element of people time, cost, and risk normally associated with preparing the technical environments so application teams can begin their work.

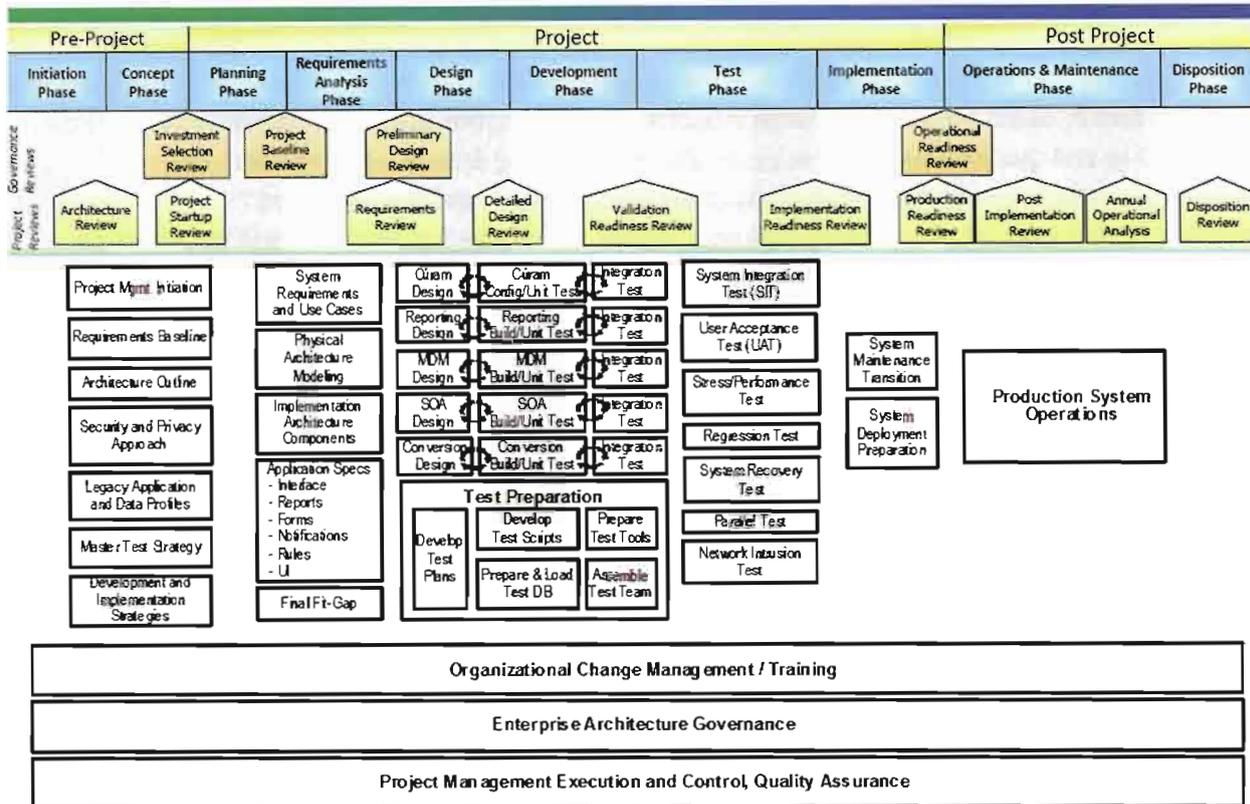

Figure IV-5: Processes and Tools Engineered for Rapid, On-Time Delivery:

Rapid Time to Implementation

SmartPro MedEE delivers on the key dimension of timeliness: we propose a 12 month implementation, from start of contract to full go-live. This is an ideal timeframe for several reasons. It is long enough to allow time to fully illuminate and understand the State’s requirements, design, build, and test the *SmartPro MedEE*, and educate State staff in the true capabilities of *SmartPro MedEE*. At the same time, it is short enough to minimize cost and risk to the State’s deadline while maximizing value to the State by providing the system earlier than required by the RFP.

Equally critical is on-time delivery. *SmartPro MedEE* embodies the tools and processes to deliver our commitment to schedule, functionality, and quality. Built upon the Federal Exchange Life Cycle (ELC) methodology and backed by our team’s extensive project management expertise, our processes include the necessary measurements, gates, feedback, and corrective processes to deliver on-time.

For the implementation of the *Cúram* COTS package, we will use the IBM *Cúram* methodology, which is specifically engineered to elicit requirements based on building an understanding of the out-of-the-box functionality with the stakeholders and then conducting JAD (Joint Application Development) workshops to leverage the leading practices built in *Cúram* and minimize customization while still accommodating the State’s business needs. Our approach will also reduce the implementation cost and the total cost of ownership by making it easier to incorporate future releases of the product. Flexibility to add functionality and integrate with other systems is provided via the SOA architecture and exposure of web services provided in IBM *Cúram*. <GEN013>

Quality

In *SmartPro MedEE*, based on extensive large program experience, our team implements a fully integrated end-to-end quality management cycle. Starting with the fundamental mission, and descending to greater levels of detail through requirements, design, and configuration / development. Our team's quality processes provide visible measures of quality that will be agreed to mutually with the State. At each stage, exit gates are clearly defined to measure the readiness before proceeding to its next major phase. These gates and measures of quality provide integral guidance to the subject matter experts primarily responsible for each phase. Quality and testing specialists develop automated tests appropriate to measure performance against the standards. These are in turn tied-back to the Requirements Traceability Matrix (RTM), illuminating how requirements are to be tested, and how specific test results tie back to system components, designs, and requirements.

Stakeholders Prepared

SmartPro MedEE represents a significant advance over the existing N-FOCUS application. To successfully implement change of this magnitude requires a two pronged key approach: a tactical view reinforced by training, and a strategic view based on explicit Organizational Change Management. Our training program teaches stakeholders the "how" of the new system. Based on extensive experience with the system's components and functionality, *SmartPro MedEE* training personnel will create and deliver customized training including computer based courseware that will integrate with the State's Learning Management System (LMS).

However, by itself, such "how-to" training is insufficient. *SmartPro MedEE* engages a dedicated professional Organizational Change Manager with extensive experience with the IBM Cúram solution, and strategically managing the organizational changes that typically occur when moving from legacy eligibility and enrollment systems to IBM Cúram. This individual collaborates with the State to customize and implement the program to prepare stakeholders for the new environment, including understanding the underlying context, how business units and their work will be affected, and how transition will be managed.

Cost Effectively

SmartPro MedEE is also cost-effective. While efficiencies and right-sizing are built in throughout the details of the program, five over-arching principles allow us to deliver cost efficiency:

- Take full advantage of extensive out-of-the-box Medicaid eligibility, enrollment, and case management capabilities of the IBM Cúram application. Wipro/IBM allows *SmartPro MedEE* to expedite the implementation process based on extensive prior work implementing State Medicaid applications. Business Process Reengineering can focus on established and refined best practices already codified in the application.
- Leverage an infrastructure that is ready for and compliant with extensive non-functional requirements, without spending unnecessary resources.
- Implement a Master Data Management approach for Nebraska which is built on the IBM Cúram out-of-the-box data model
- Implement a reporting approach using IBM Cognos to provide standard reports required by the Department and provide federal compliance reports as well as ad hoc reporting capability

- Build upon IBM's PureApp Server Appliance, reducing middleware integration complexity, time, and risk and providing, easy to manage, on-demand virtualization of the technical environments. Full use is made of PureApp's virtualization environment to utilize all computing resources of both the Primary (Production) and Secondary (Disaster Recovery) locations.

Future Ready

SmartPro MedEE is prepared for the future. Most significantly, *SmartPro MedEE* is prepared for the business future. While *SmartPro MedEE* is limited to Medicaid, IBM's Cúram application is fundamentally designed for the larger general Integrated Eligibility and Enrollment needs of a State. When the time comes to consider migration, the remaining functionality of N-FOCUS to a modern system, *SmartPro MedEE* will be ready to provide a cost effective solution path, without disrupting or affecting the needs and operations of the Nebraska MTLC.

i. Functional Requirements

i. Functional Requirements

In order to provide the State a clear understanding of *SmartPro MedEE* functionality, we present our discussion of the requirements from a business perspective. The section is organized as a case worker would interact with the system. We are hoping the story based approach makes it easier to envision how work would be done using *SmartPro MedEE*.

Requirement numbers are included at the end of the paragraph in which they are addressed. This will allow reviewers to track which requirements are addressed and how our solution meets the requirement. Reviewers will also find a table in each section that includes all of the requirements addressed in that section.

Overview

The IBM Cúram Universal Access application, referred to throughout this document as the Public Self-Service Portal, provides the *SmartPro MedEE* solution with an intuitive client-facing self-service portal. The portal is a fully configurable, public-facing web application that provides the public with secure online access to information, services, and programs. Portal functionality includes screening, eligibility determination, and managing life events (i.e., changes in circumstances for client and household members). The ability to screen and apply online for multiple programs will provide better service to the families and individuals of Nebraska.

The Public Self-Service Portal is designed to make the interactions between members of the public and their families, community service providers, and the MLTC easier, more efficient and, most importantly, more effective. It provides citizens with a more active role in managing their information through subsequent ongoing case management and service delivery. On-line access by the public also helps alleviate the necessity for individuals to personally attend meetings and interviews at local offices, unless a face-to-face contact is required to comply with policy.

The public's role in managing their interactions, with little to no intervention from MLTC personnel, also contributes significantly to reducing the administrative burden on the Department; allowing personnel to improve their productivity and better serve members of the public.

Key benefits of IBM Cúram Universal Access within the overall *SmartPro MedEE* solution:

- Supports service to clients in multiple languages. *SmartPro MedEE* and its Public Self-Service Portal will provide service to the public in English and Spanish; <GEN016>
- Provides immediate access to Federal/State programs and community services that match the needs of the individual;
- Offers a wide range of functionality including needs-based triage, multi-program screening, multi-program applications/application renewals, and referrals;
- Delivers a purpose built, COTS solution which is fully configurable so that it can be readily adapted without costly and time-consuming coding;
- Integrates with other IBM Cúram components in the *SmartPro MedEE* solution and can serve as a front-end self-service solution across single or multiple back-end systems, including legacy systems.

NOT033

OPS054

Unauthenticated Public Access

The proposed *SmartPro MedEE* solution through the Public Self-Service Portal supports a number of options for providing the public with access to self-service offerings. For unauthenticated users; i.e., individuals who have not registered a personalized 'Individual Account', limited functionality is also available. These unregistered users can perform triage and check their potential eligibility for a range of services and programs anonymously by providing basic information. The aim is to provide the citizens of Nebraska with the information they need to make an informed decision about whether or not to proceed with an application for services and/or programs, and to make the process as simple as possible to encourage participation.

Public Access via Self-Service Account

In order to proceed with an application and/or avail of the full range of self-service offerings, an unauthenticated user must first register an account on the system.

SmartPro MedEE, through the Public Self-Service Portal, allows individuals to register their Self-Service Accounts online. Initially, basic levels of authentication are granted which allow access to triage, screenings, and any applications that may have previously been saved or submitted. Once the user is identified by MLTC, higher levels of authentication which provide access to a wider range of facilities may be granted and made available through the Self-Service Account.

Figure IV-6: Sample Self-Service Account Home Page

The Self-Service Account home page (Figure IV-6) is the first page presented when an individual logs into his/her account. The home page provides access to a range of other features. As previously mentioned, this page will be provided in English or Spanish based on the initial preference specified by the citizen. <GEN017>

Pre-Application Processing

A configurable feature of the *SmartPro MedEE* self-service functionality supporting a no wrong door approach is the Triage functionality. Triage quickly identifies an individual's needs in order to direct that person to the services and programs which best meet those needs. A short set of guided questions is presented. Based on the answers provided, rules determine the services and programs that may help meet their needs. Providers of services are displayed on a map, as shown in Figure IV-7 below, along with provider details such as contact information, accreditations, specialties, areas served, intake procedure, eligibility, fees, and documents required. A "Get Directions" function allows individuals to view and print directions to a provider's location.

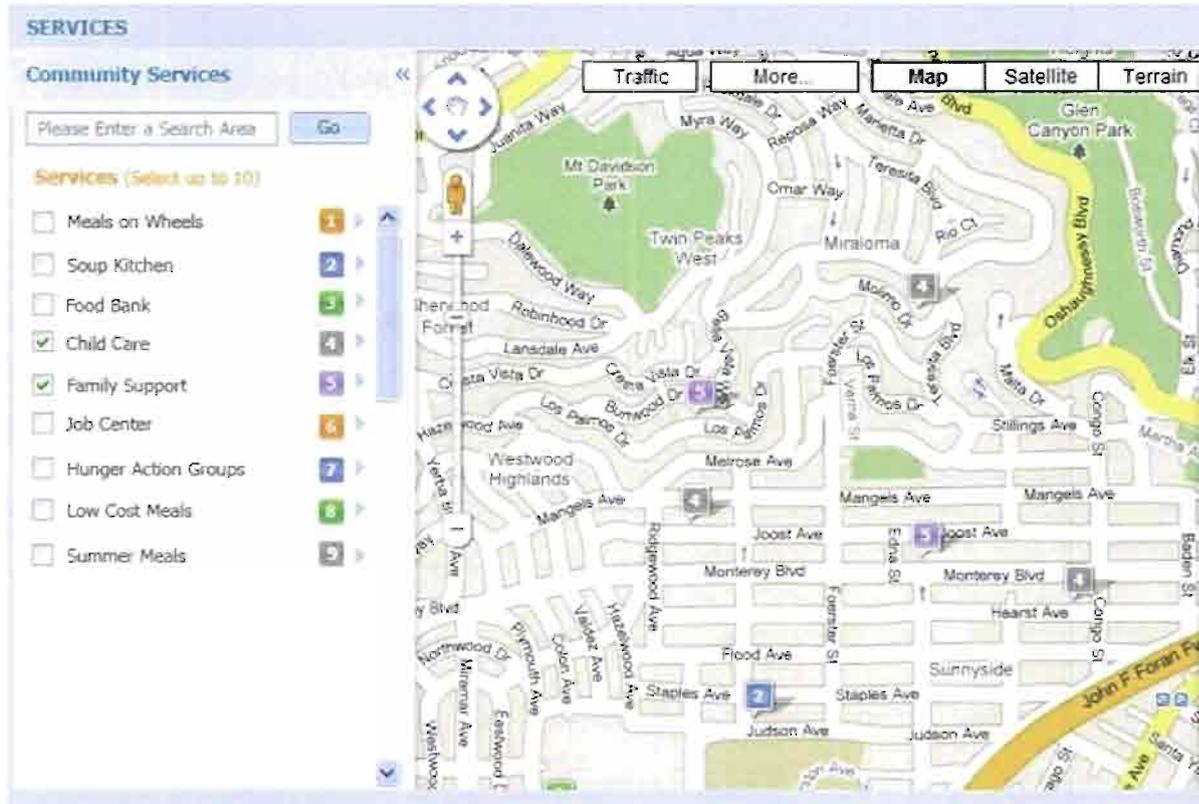

Figure IV-7: Sample Services Map

Based on the services and programs identified, individuals can choose to refer themselves to various service providers, can continue to screen for eligibility for recommended programs, or apply for benefits. Triage functionality is also available to unauthenticated users.

Screening allows an individual to determine if they are potentially eligible for one or more programs based on a short set of guided questions and a subset of eligibility rules. Based on the screening results, the individual can decide whether or not to proceed with an application for identified programs. <ELG173>

Two types of screening are supported. Individuals can first screen themselves by providing answers to a short (one page) list of questions and get a list of programs for which they may be potentially eligible. This type of screening looks at high-level factors that typically screen individuals into (or out of) a range of different programs.

Full screening gathers more detailed information and is generally more accurate than the one page screening. Questions are divided into several major categories including questions about the composition of the household, as well as the relationships, income, resources and expenses of those household members. Using the collection of detailed information gathered from the citizen, the **SmartPro MedEE** Public Self-Service option presents a list of programs for which the individual and/or their family may (or may not) be eligible. Figure IV-8 provides an example of how household relationship information is gathered.

Figure IV-8: Sample of Collecting Home Relationships Information During Screening

The results of both types of screening are automatically generated by evaluating the data collected with respect to one or more screening rule sets. The individual is then presented with the option of submitting an application. Screening functionality is also available to unauthenticated users. Data gathered throughout the screening process, once saved, will be used to pre-populate screens accessed during the application process or when authorized users query case or individual information.
<ELG017, ELG019, ELG044>

In addition to triage and screening options, the portal serves as an information source to Nebraskans accessing the portal. Portal users are able to find local offices and contact information, along with associated directions to the nearest local office. Portal users can also use links to access education and informational materials as provided by the State. This would include information about Medicaid State programs and information about eligibility to help citizens understand the available programs and those programs for which the citizen and his/her household may be eligible.
<ELG022, ELG023, GEN002>

Applying for Programs

In order to apply for programs, a range of information such as personal details, details about the household, and the household's income, resources and expenses are required from the applicant. This information, referred to as 'evidence' in Cúram, is used to determine eligibility as well as forming some or all of the individual's profile. Evidence collected during triage/screening (i.e., pre-application processing) can be used for subsequent application processing. The persistence of data from one stage of the process to the next eliminates the need for re-keying and therefore significantly

reduces the amount of data that needs to be entered by individuals during the application process. <ELG024, ELG025>

An application, whether for initial application or an application renewal, can be configured to be undertaken either as an online application form submission or by using a 'hard-copy' PDF application form that is pre-populated with information previously provided by the applicant. The populated form can then be brought to an office, e-mailed, faxed or mailed by postal service to the MLTC by the individual. The hard-copy application is retained within the system and is available for access and retrieval after submission. Once all data is verified, it is then run against the eligibility rule sets of the various programs to identify, in real time, eligibility for those programs. In the event that the system is for some reason unavailable and all data has been provided and verified, *SmartPro MedEE* will flag the case for processing and trigger the eligibility determination once the system is again available. It is important to note that the same rule set(s) is executed regardless of how the application enters the system so the applicant is guaranteed consistency in their results (i.e., no wrong door). <ELG028, ELG042, ELG043, ELG044, ELG051, GEN008, GEN046>

A simplified application process will also be provided to determine whether a pregnant woman meets the criteria for presumptive eligibility for temporary pre-natal care. Eligibility for presumptive eligibility will include effective dates for coverage (i.e., start and end dates) and will also trigger a notification to the eligible applicant that a full application will be required for coverage to continue beyond the presumptive eligibility end date. <ELG056, GEN068, NOT033>

Self-Service Portal: Changes in Beneficiary Information

Beyond initial screening and application processing, there is additional functionality provided in the self-service portal to allow citizens to report information regarding changes in circumstances; this additional functionality is referred to as life event management. A life event is a situation that occurs which may result in a series of interactions with the Department. Some examples include marriage, pregnancy, birth of a child, or death. Life Events Management provides the capability to configure events which may impact the programs and services that individuals receive. Life events may also be configured to provide information about other programs or community resources that are appropriate for that event.

- Change of Address**
Display Definition - If you are moving or thinking of moving it is important to ensure that you change your address with the proper authorities. You should notify the federal and your provincial or territorial government to ensure that your benefit payments continue to arrive on time. We have compiled a checklist to ensure that you contact the right people.
- Changing Jobs**
If you are searching for a new full-time or part-time job in the private or public sector, we can help. There are a number of tools available to help you search job listings, create a resume, choose a career and assess your skills. You can also register your job change online.
- Income Changes**
If your income has changed, this may have an effect on benefits you are receiving. You can register these changes online.
- Getting Married**
This section provides services and information of use to the recently married.
- Getting Divorced**
We have prepared a list to help you understand the legal issues and process of divorce. The list may inform you about your rights and responsibilities, but for legal advice, please consult a lawyer.
- Having a Baby**
This section provides information on registering a birth, child care options and parenting support services.

Figure IV-9: Sample Life Events Page

The Sample Life Events Page (Figure IV-9) presents the client's view when reporting a change via the Public Self-Service portal. On selection of a life event, the individual is presented with a guided set of questions based on the life event selected, as well as any other related life events that may have happened. For example, if a change of address is reported, there may be other implications such as a change in the rate of rent payments or a change in household composition. The individual is also provided with a list of services/programs (as per Triage) based on the life event submitted. This allows the individual to refer themselves for such services/programs or to screen and/or apply for additional programs.

Case/client information received through the self-service portal will be processed by the *SmartPro MedEE*. Based on the data type, the system can be configured to automatically apply the data to the case or to put the data into a holding area, inform a case worker, and permit the case worker to review and accept or reject the data. The information accepted by the evidence broker or case worker may trigger an automatic eligibility redetermination. A redetermination may result in changes or closures to beneficiaries, households, and eligibility categories. *SmartPro MedEE* will present the results of all eligibility determinations which may include those resulting from an initial application, reported and verified changes, and redetermination actions - on the decision screen. Details reflect the results of the financial and non-financial determinations. The system can be configured to issue additional notification or set flags to cases deemed ineligible due to established financial and non-financial criteria. The Department can also set 'applicable limits' for data which will allow automated redeterminations based on the data received on a renewal form or that received from a trusted source. For example, a redetermination form submitted via the self-service portal or through other means that reflects no change in circumstance or a change in data that falls within MLTC's

‘applicable limits’, will automatically trigger a redetermination and not require worker intervention. ‘Applicable limits’ will be established by MLTC and apply to specific data elements and may apply to specific programs; ‘applicable limits’ will appear in the program rules. A history of changes to an individual’s data is maintained, regardless of whether the change was initiated via the self-service portal or was updated by a worker or an external source (e.g., interfaces). <ELG020, ELG100, GEN037, GEN041, GEN051, GEN083, OPS054>

Client Account Management

The self-service portal provides access to additional information features available via the Individual Account including:

- **Payments** – displays a history of all financial assistance payments made to date.
- **Applications** – in addition to creating and submitting an application, the portal provides a view of submitted or in-progress applications so that an applicant can see the current status of an outstanding application. A new application can also be initiated and the system can highlight discrepancies between existing household data and data provided in the new application. Business rules will need to be defined to determine how to manage discrepancies. <ELG041 ,ELG143, ELG145>
- **Activities** – displays services, referrals, and actions which are scheduled for individual and/or household members
- **Appeals** – access information about the appeals process and fair hearings, submit appeals and reconsideration requests, and monitor status of appeals and reconsiderations <APP001, APP036>
- **Contact Information** – displays the individual’s contact details such as address, email and phone numbers. Contact information of caseworkers associated with the individual’s cases may also be displayed. <ELG018, GEN024>

Predictive Response Manager

The self-service portal includes additional functionality to further enhance the client experience and assist citizens with their interactions with the Department. The Predictive Response Manager provides a configurable decision support capability that displays information relevant to the specific individuals. The objective is to “predict” why the individual has logged into their account and attempt to answer the individual’s questions without the need to browse through various aspects of their account in an effort to find an answer to their questions. For example, messages can be defined in relation to their financial assistance payments, case status, meetings, activities, etc. General system messages can also be displayed.

Outreach

Outreach is a configurable rules-based capability that facilitates the display of targeted messages based on information held about the individual. For example, where an individual has reported the birth of a child, a message can be displayed to remind the individual to register the child’s birth and a link to the registration website can be provided.

Intake Processing

NOT016

OPS001, OPS013

Application and Intake

Using the Public Self-Service Portal, clients may choose to apply over the internet for programs offered by the MLTC. This may be carried out by the client following a screening process, or without having performed screening. A sample online application home page is shown in Figure IV-10 below. Clients may conduct all applications, initial and redetermination/renewals, by using the application form available through the Public Self-Service portal. Within the first 30 days following the submission of an application and prior to the application being processed, the applicant or authorized representative can submit updates to data reflected on the application. This can be done by accessing the client record via the self-service portal or contacting MLTC directly. Changes to client and household circumstances that occur after the application has been processed can be reported using the Life Events self-service feature or by reporting that change directly to the assigned worker or authorized Department staff. **SmartPro MedEE** will provide full-blown applications where the individual can apply for one or multiple programs such as Medicaid and State-offered Medical Assistance and extended to include TANF and SNAP, when authorized by the Department. Additionally, **SmartPro MedEE** will accept applications received via interface from the Marketplace, using the data provided to determine individual and household eligibility for Medicaid. **SmartPro MedEE** will base all eligibility determinations on current policy governing these programs. **SmartPro MedEE** will also prevent the individual from submitting multiple applications for the same program within a 30 day period unless an application submitted during that 30 day window has been denied. Therefore, if an application for a program is pending, the system will not allow the applicant to submit another application for that same program/benefit. The applicant or authorized representative also has the ability to withdraw an application for assistance at any point prior to the processing of that application. Whether filed online or through other means, the applicant/client has the ability to check the status of an application or other processing by accessing the self-service portal using their personal log-on credentials. The client and their authorized representative can access data, including application data, by accessing the system through the use of their personal log-on. Access to case and individual information is governed in accordance with the permissions associated with the log-on credentials and the person's affiliation with the case. All case activity will be logged

and maintained as part of the case transaction log. <ELG004, ELG029, ELG041, ELG124, ELG125, ELG126, ELG127, ELG128, ELG144, ELG146, GEN046>

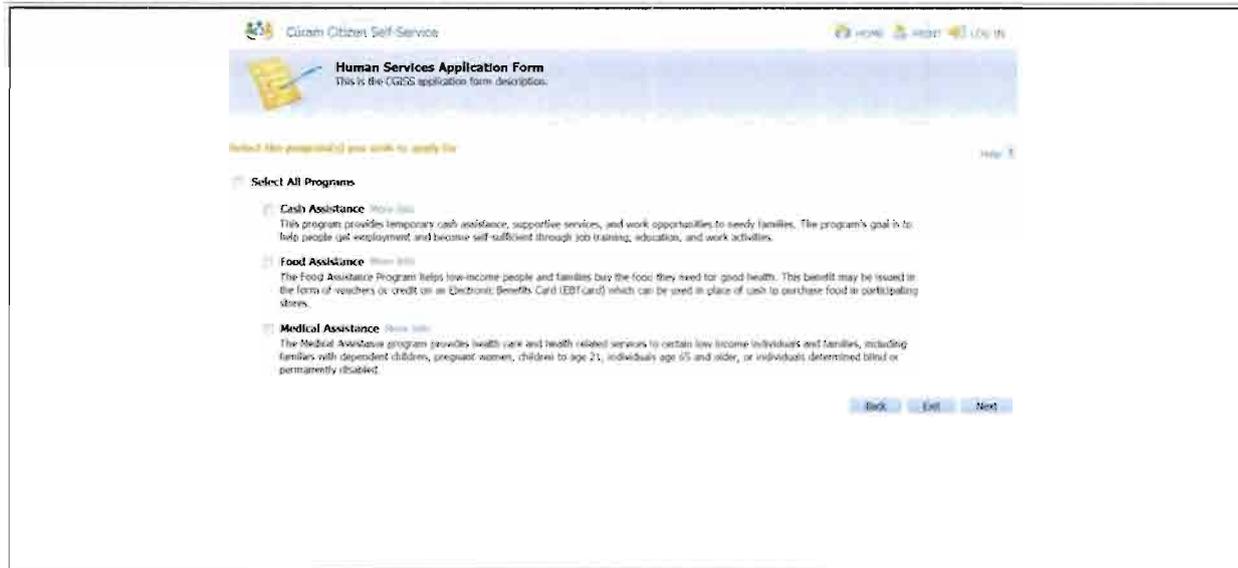

Figure IV-10: Sample Online Application Home Page

Individuals conducting business via the Public Self-Service portal or workers conducting MLTC business will be guided through the various activities. For instance, there is a process for filing an application for assistance. Once the individual selects the option to file an application and determines the program(s) they will apply for, the *SmartPro MedEE* will guide the individual through the application process. Screens will be scheduled and presented to the applicant first to collect mandatory information. Subsequent screens will be based on the person's responses to questions or the data they provide. Individuals indicating they are employed will be presented with screens that will collect employment and wage information, for example. In essence, each task or activity has a predetermined workflow. *SmartPro MedEE* will also capture details concerning the person performing the task/activity, the time and date of the activity, the method used to complete the activity, and the location from which the user is conducting MLTC business. For example, the system will track the date and time an applicant completes an application, whether the application was submitted online or via the case worker or other designated staff, and the location of the individual. <ELG130, ELG131>

In support of the ACA, the *SmartPro MedEE* solution delivers a streamlined application and redetermination process to collect and verify client and household information, including e-verification through trusted sources. In the first step of applying and determining eligibility for health insurance assistance, the solution captures basic information about the applicant. Streamlined applications comply with CMS requirements and abbreviated applications will be made available in support of specific non-MAGI applications, respectively. The MLTC can set 'applicable limits' for data which will allow automated redeterminations based on the data received on a renewal form or that received from a trusted source. For example, a redetermination form submitted via the self-service portal or through other means that reflects no change in circumstance or a change in data that falls within the MLTC's 'applicable limits', will automatically trigger a redetermination and not

require worker intervention. 'Applicable limits' will be established by the Department and apply to specific data elements and may apply to specific programs; 'applicable limits' will appear in the program rules. <ELG005, ELG006, ELG007, GEN004, GEN047, GEN051, GEN064>

The system uses personally identifiable information about the client to retrieve household and income information from various data sources, such as the Federal Data Services Hub. This same information is used to search the *SmartPro MedEE* database in order to determine if the applicant or any member of the applicant household is registered in the database. Search results will provide the authorized staff details in order to determine if the person does in fact have a record within the *SmartPro MedEE* database or must be registered as a new participant. If known, all available individual and case information is brought forward for review and update. <ELG002, ELG003, ELG139, OPS001>

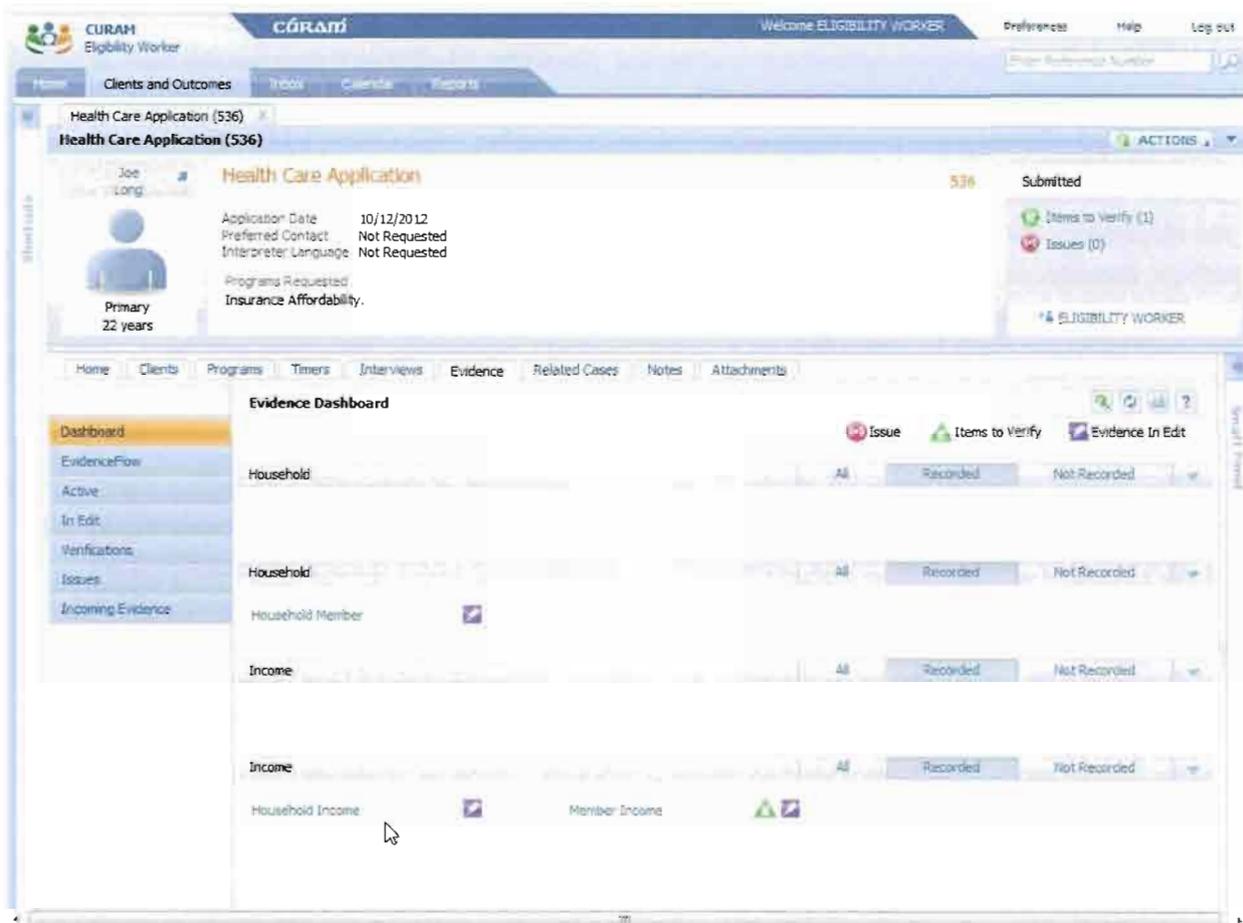

Figure IV-11: Healthcare Application

Information collected on the streamlined application, illustrated in the Figure IV-11 Healthcare Application, includes, but is not limited to:

- Applicant details, including basic identifying data and address
- American Indian/Alaska Native Tribe membership
- Social Security Number details
- Citizenship/lawful presence details

- Household member details and relationships
- Tax filing status
- Additional household member details, such as pregnancy, disability, incarceration status, receipt of other benefits, and availability of employer-sponsored health insurance
- Income (received from the Federal Data Services Hub, other trusted sources, or manually reported).

As data is entered *SmartPro MedEE* on-screen edits will confirm that the information is entered in the proper format. For example, the system will confirm that dates are entered correctly. Drop down menus may be used to further assist the individual with data entry. <ELG005, ELG032, ELG045>

The *SmartPro MedEE* will accept an application where SSNs are not provided for all members of the household. When this occurs, *SmartPro MedEE* will generate a unique identifier, and allow a worker to add the SSN to the member record once it is obtained. *SmartPro MedEE* will then set the SSN as the primary reference number for the member. The auto-generated unique identifier will remain on the member record allowing searches using either reference number. <ELG123, ELG141>

Applicant and household information is only collected once and will be used by *SmartPro MedEE* to create the electronic case file. This file will organize data into categories such as demographics, relationships, income, resources, and education, all of which will be readily available to authorized users. It will also be used during eligibility and entitlement determination and benefit calculation. Such data will be maintained as individual and case historical information. This data will be available for sharing through the solution's Enterprise Service Bus, when applicable and allowed. <ELG072, ELG129>

The *SmartPro MedEE* solution provides intake features via a number of channels. The online user can enter application data which is managed by IBM Cúram Intelligent Evidence Gathering (IEG). The IEG functionality provides scripting capabilities to dynamically tailor questionnaires based on the user's responses and only asks those questions necessary to make the appropriate determinations. The design of this flow is geared to maximize the quality of the user's experience, while minimizing any redundancy in data collection or processing. In addition, embedded field-level help assists individuals in understanding and providing requested information accurately. <GEN009>

Additionally, intake processing is provided to internal workers – such as intake or call center workers who may process applications received via phone, mail or fax. These intake workers would also receive and process any adjudications required on applications received via the online channel, which may require manual verifications. Authorized users can review application data and eligibility determinations before disposing of an application. Application disposition can result in the reviewer not accepting the eligibility determination decision and putting the related case on hold for further investigation/review. In addition, internal workers can manually navigate to any application screen that they are authorized to access. This allows the worker to complete a new application in an order that suits their situation. *SmartPro MedEE* workers can process verifications from their view of the healthcare application. <ELG116, ELG117, ELG122>

SmartPro MedEE will produce a summary of all information entered on the application allowing the applicant or authorized representative to review and, if necessary, modify information prior to electronically signing the application and submitting it to the Department. *SmartPro MedEE* will

highlight or indicate areas where information required for a specific program of assistance is missing. This will allow the applicant/authorized representative/worker to complete that portion of the application by providing the missing data. The applicant can print the application or summary if they desire. Once submitted, the applicant will be informed of the privacy and confidentiality protections in place for the information they have provided. Additionally, the applicant will receive a list of actions that they must complete, verifications that they must provide, and the timeline during which they must be provided in order for the application to be processed in accordance within each program's processing timeframe. The worker has the ability to extend verification timeframes if notified by the client indicating a hardship in obtaining and submitting the needed verification. *SmartPro MedEE* will track all verifications received allowing authorized individuals the option of accessing and printing a list of outstanding verifications if needed; this capability will be available through enhancement of the out-of-the-box functionality which will link the list of verifications received to the notification functionality. <ELG014, ELG021, ELG034, ELG035, ELG038, ELG043, ELG077, ELG111, ELG113, ELG114, ELG118, ELG119, ELG148, ELG149, NOT016>

Applications submitted via the self-service portal as well as those received through other means will be assigned or routed to designated MLTC staff for processing. *SmartPro MedEE* can automatically assign the application based on instructions provided by program administrators. For example, the Department may assign the application based on geographic location of the client, based on worker specialty (i.e., language, program), or in a predetermined order. All workers will receive notification via their home page of the newly assigned case. The case will be accessible for review via the link on the home page. The Department may also opt to funnel or direct all new applications to a specific unit or supervisor for assignment. <ELIG142, ELG143, ELG145>

SmartPro MedEE will provide the client with the option of checking the impact of a change in circumstance. For instance, if a client is considering a change in household composition (someone moving into or out of the home), they have the ability to self-assess to determine the impact of that change on their eligibility and benefit level. An increase in household size that also results in an increase in countable income may impact the amount of Food Stamps the household is eligible for and may impact other benefits depending on the relationship of the new household member with all other members of the household. This information may be used to determine whether or not that change will occur. As is the case with individual and household information received and verified at application, changes in household circumstances are used by *SmartPro MedEE* to determine the composition of a household for eligibility purposes. Individuals will be grouped in accordance with program specific policy. Eligibility determinations group individuals into households or cases based on program rules and regulations, determining the combination of individuals and benefits that are most beneficial to each party in the household. <ELG027, ELG074, ELG105>

Verification

The *SmartPro MedEE* solution supports the process by which the accuracy and validity of evidence is verified. *SmartPro MedEE* includes the functionality to define multiple, and effective-dated, verification conditions and items for a particular piece of evidence (data), for example, a date of birth, an address or an income amount.

The Department can define and manage the categories of data that may require verification as part of program delivery. Where verification of specific categories of evidence is a prerequisite for program eligibility, Cúram provides the means for setting evidence verification requirements and the functionality to record and manage verification details. *SmartPro MedEE* will help the MLTC and its case workers to focus on obtaining the required evidence verification items rather than needing to keep track of the types of evidence that require verification or the rules involved for each verifiable evidence type. The setting of verification requirements ensures that verification of critical evidence data is managed in a controlled and consistent manner.

The intake process, as well as ongoing renewals and case management, integrates with our electronic verifications process. User identities are verified and in the case of new or updated registrations, existing systems are queried to find matches, create links to external data and minimize duplication. Data from trusted sources, such as the Federal Hub or local sources are used to verify and to streamline data entry. *SmartPro MedEE* will notify the assigned worker, via their home page, of inconsistencies between data received from a trusted source and that reflected in the case file. The worker, based on this information will take the necessary steps to confirm the accuracy of the data being reflected in the case before using it in eligibility and entitlement determinations. *SmartPro MedEE* will assess the impact of all case updates, whether received from a trusted source or those updated by the worker based on verifications received, on the individual's and household's eligibility. Updates will automatically trigger *SmartPro MedEE* to apply that change against the rules applicable to active or pending cases in order to process the impact, update eligibility and generate notices to those impacted. Client notifications reflecting the results of eligibility determinations contain details such as the date of the application, date the decision was rendered, the eligibility begin date, and any calculations used to determine eligibility and the level of benefits. Workers can be notified if a trusted source such as the Federal Marketplace Hub is not available to verify client information; in these situations the worker can initiate the process to obtain the needed verification through other means. That application disposition can result in the reviewer not accepting the eligibility determination decision and putting the related case on hold for further investigation/review. <ELG073, ELG075, ELG079, ELG080, ELG114, ELG138, ELG147, ELG149, OPS001>

Where electronic sources are not present or available, the user would also be prompted to provide verification directly to the worker or upload an electronic version of the verification documentation, which could be subject to further review by an internal worker. Verifications are scanned and associated with the application or renewal individual and household. The system will index verification documents to facilitate the authorized user's ability to search and review documentation associated with a case or individual. For instance, verifications dealing with wages or earned income will be indexed allowing that authorized user to locate specific earned income details as needed. <ELG033, ELG120, OPS013>

Verifications processing uses the IBM Cúram rules engine and can be configured or tailored to the Department's specific requirements. Multiple verification sources with varying levels of trust may be defined for each piece of data used as evidence in eligibility determinations.

The **SmartPro MedEE** solution will allow authorized workers to view, confirm and submit corrections to verification results. **SmartPro MedEE** will allow an applicant to submit changes to address any inconsistencies to data reported by external entities. <ELG078>

SmartPro MedEE will determine individual and case eligibility by applying reported, verified data against the program rules for each category of assistance selected on the application. The system-generated notice of decision prepared and distributed to the client and identified authorized representative will provide details of each eligibility determination. The decision notice will also inform the recipient of their rights and responsibilities and the process to follow should they opt to file an appeal or grievance concerning their eligibility determination results. <ELG013, ELG039, ELG070>

Application Processing

SmartPro MedEE is designed to automate and track processes. It is quite possible that an individual or household will apply for multiple programs or services on a single application – with each program having different processing timeframes and verification requirements. **SmartPro MedEE** will notify workers of impending deadlines or tasks by generating alerts or ticklers to the worker’s home page. Applications received are time and date stamped – information that will be used by the system to track processing timeframes for each category of assistance as well as when the various pieces of documentation or verification must be provided by the applicant/client. A reminder will notify the worker that the application for Medicaid and/or other programs must be processed by a specific date. That reminder will appear on the worker’s home page, elevating in queue until completed or the deadline is extended. Tasks and activities, such as processing the Medicaid application, will be elevated to the attention of a supervisor if not addressed within the prescribed timeframe. All applications, whether submitted as the result of a screening decision or those that originate directly with an application are tracked based on the application submission date, maintained as part of the electronic case file, and retained in the client’s history. As an additional aid, workers have the ability to manually create alerts. The system will track both manual and automated alerts. <ELG025, ELG040, ELG135, ELG136, GEN076, GEN080, GEN081>

In the event that a new program is available, for example, a new medical assistance program or coverage group, **SmartPro MedEE** will consider all applicable dates and consider an individual’s eligibility for that program by applying all eligibility criteria and program rules to the individual circumstances. Program rules are date-specific which will prohibit eligibility for the program before the actual program availability date. For instance, if an application is pending and a new program becomes available, all individuals and circumstances will be compared to program criteria. In the instance of Medical Assistance, the MLTC will determine the new program’s position in a list of programs in order to guarantee that the individual is determined eligible for the program that is most beneficial. <ELG076>

Participant Management

Requirements Addressed:

ELG008, ELG081, ELG082, ELG083, ELG085, ELG086, ELG087, ELG088, ELG089, ELG090, ELG091, ELG092, ELG093, ELG094, ELG095, ELG096, ELG106, ELG109, ELG110, ELG123, ELG140, ELG161, ELG164, ELG165,

GEN041, GEN074, GEN083

OPS038, OPS039

The *SmartPro MedEE* will use the IBM Cúram Participant Management component to provide comprehensive support for recording and managing details of clients and their interactions with the MLTC. Highlighted features of IBM Cúram Participant Management and their corresponding benefits include the following:

- **Centralized Master Client Index** – allows organizations to register and manage details of a client, assigns a unique identifier to each registered client, and provides statewide access to registered clients for users with applicable security authorizations. <ELG081>
- **Powerful, flexible searching** – allows users to quickly locate client details, including the capability for “sounds like,” nickname (thesaurus-based), and wildcard searching to increase efficiency of searches. <ELG082>
- **Duplicate client record identification** – greatly reduces the chance of duplicate client records and improving client tracking and lowering the potential for errors and fraud. If a user inadvertently creates a duplicate, a process is included to enable the user to merge the clients and designate a primary client record for ongoing processing. <ELG083, GEN025>
- **Holistic approach to managing client information** – through integration with case management and client self-service functionality, IBM Cúram Participant Management empowers agencies to improve service delivery to their clients and to increase the chance of achieving the most appropriate outcomes.

The *SmartPro MedEE*'s case management component provides extensive functionality to facilitate the creation, management and tracking of cases in support of social enterprise program and service delivery. In Cúram, a case is used for recording and maintaining interactions between clients and the MLTC to support program and service delivery.

By providing an “electronic folder” capability, *SmartPro MedEE* enables relevant case data to be managed in a centralized, client-centric way. This ensures that information relating to a case is easily accessible to MLTC staff and permits the status of the case to be readily managed and tracked.

Highlighted features of the *SmartPro MedEE* case management component and its corresponding benefits include:

- Client-focused approach provides caseworkers with a holistic view of the information relating to a case and the clients involved, promoting improved service to clients.
- Integrated case design allows the MLTC to manage multiple programs and services to a client or household through a single case; which helps avoid duplication of data and encourages organizational efficiency.
- Integrated workflow processing standardizes and automates routine case processes, allowing Department staff to spend more time on clients that require special attention.

- Intuitive case evidence management facilitates efficient recording and maintenance of the key client data, or evidence used to determine program eligibility and entitlement.
- Case evidence is effectively dated to allow for “time slicing” supporting retrospective case assessments and auto-detection of overpayments or underpayments.
- Automated eligibility determination and entitlement calculation removes the burden of decision making from case workers, resulting in quicker and more consistent eligibility and entitlement decisions.

Client Registration

The registration function in Cúram allows users to record essential identification information about each client and can be implemented according to the business requirements of the MLTC. For example, this process may be implemented as an independent process, or as part of case processing, screening or some more extensive business process. Because Cúram maintains client data in a centralized database, a client’s details need only be registered once. Thereafter, client data may then be accessed and maintained in this centralized database by any appropriately authorized user.

During the registration process, the person search functionality can be invoked (if required) to search the Cúram database in order to identify existing participant records which may match, based on key identity criteria such as name, address and date of birth. All potential matches are displayed to the user in order to help prevent creation of duplicate participant records. The user can increase the number of entered search fields to further filter search results. The results returned help the user decide whether to continue with the registration or to carry out any necessary actions to establish identity. To avoid duplicate client records the worker or designated Department staff can initiate a person search during the registration process. Figure IV-12: Pre-Registration Person Search view provides a sample of the search criteria that can be used by the worker to focus or narrow the results of this search <ELG086, ELG088, ELG089, ELG090>

Figure IV-13: Client Registration Page

A user can enter a wide range of data at the registration stage with certain key details being mandatory by default. Once all required information has been entered and the registration process completed, a unique identifier is generated and assigned by Cúram to the registered client. Cúram also supports recording other types of identifiers, such as driver's license number. When the user has completed registration, the system allows the user to either view the client's details on the person "home page" or register another individual. <ELG082, ELG123>

Client Maintenance

IBM Cúram Participant Management facilitates the on-going maintenance of each client's details. The person home page (Figure IV-14) is the starting point for navigating through the various elements associated with a client. The home page displays key information such as name, contact information, preferred communication method and summary information.

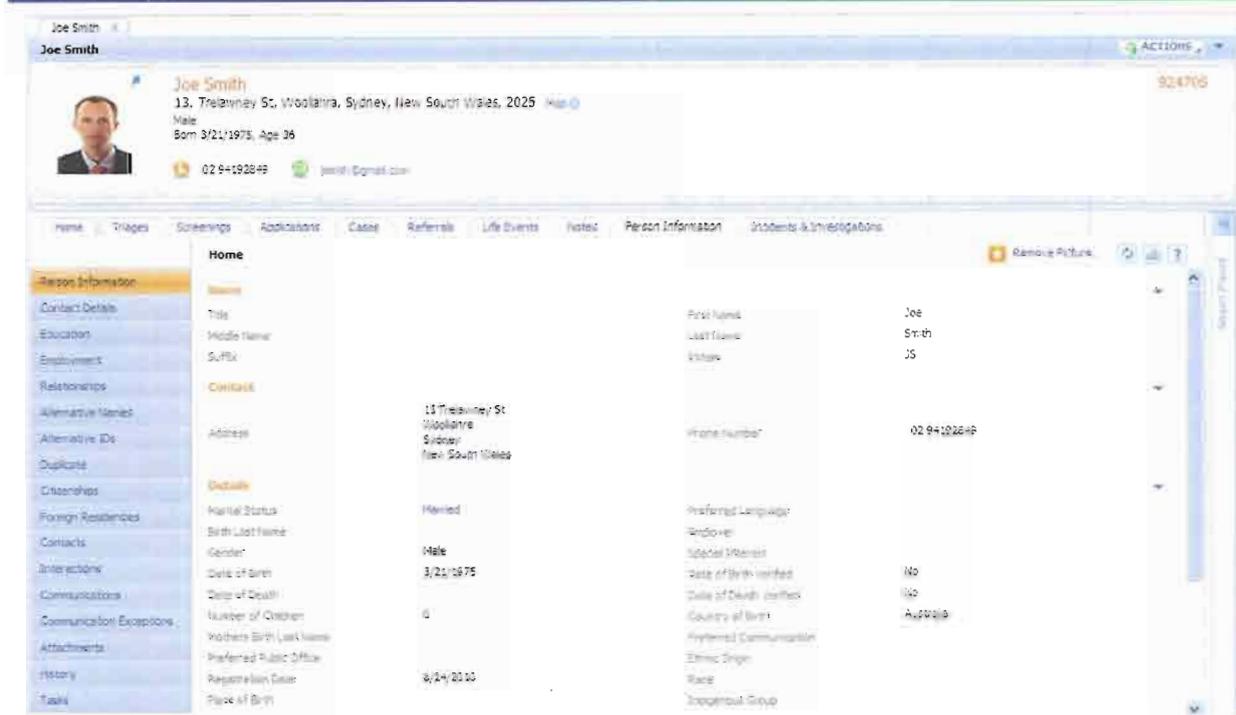

Figure IV-14: Person Home Page View

The person home page provides an extensive menu of options to view, update and add information concerning the individual. For example, the “Relationships” option navigates the user to a list of relationships for that person. Authorized users can then obtain more detailed information about each relationship record displayed in the list and can amend, delete or add new relationship details as required. Security profiles are used to determine what types of person information can be viewed and updated by a user. Changes to a person’s data are retained and a history of changes can be viewed and, with appropriately defined business rules, changes to specific types of data can trigger alerts to specified work units and can trigger automated processes such as eligibility redetermination (e.g., child turns 18 years old). <ELG106, <GEN041, GEN083, OPS039>

The following information is maintained for all ‘persons’ in Cúram:

Table IV-4: Attributes Maintained for Persons

Category	Description
General Registration Information	Includes the person’s name, registration date, preferred public office, preferred communication method, and preferred language. Also includes participant sensitivity level (similar to a security clearance level), payment currency, method of payment, and the default frequency by which payments are issued to the participant.
Addresses, Phone Numbers, Email Addresses and Web Addresses	For each address, phone number, email address or web address recorded, Cúram allows a default or “primary” record to be specified as well as the “type” of record in each case. For example, phone number types include

Category	Description
	"mobile" or "business", and address types include "mailing" and "business".
Administrators	Administrators are users who are assigned to manage the interactions between the organization and the person.
Alternative IDs	An alternative ID is a unique person identifier. Cúram automatically generates an alternative ID (reference number) as part of the registration process.
Alternative Names (Aliases)	Alternative Names are those names other than the person's preferred or known name, for example, professional name, alias and so forth. Alternative names are utilized when completing name searches.
Bank Accounts	Contains the details of a person's bank accounts, which can be used to facilitate electronic fund transfers (EFT) to or from the organization.
Cases	Cases for which the person is the primary client on the case.
Citizenships	Citizenships are countries where a person holds citizenship and on the period of validity for the citizenship.
Communications	Communications are items of correspondence to or from the organization, including letters, telephone calls or emails-based. Outgoing communications can be created using MS Word templates, XSL templates, or email and then automatically stored for a person. Incoming communications can also be recorded after they have been received.
Communication Exceptions	A communication exception is used to indicate that a person does not wish to receive communications in one or more formats.
Contacts	Contacts are persons assigned to act on behalf of a client.
Education	Information on a person's educational history and qualifications.
Employment	Employment details for the client, including the employer name, the type of employment, period of employment and the number of hours worked per week.
Financials	Displays the financial transactions between a client and the organization including payments arising as a result of case processing, account adjustments or payments received by the MLTC from the client.
Foreign Residencies	Foreign Residencies are any periods of time during which a person is resident in a country other than that in which the organization is located.
Interactions	An interaction is a generic term used to describe an

Category	Description
	automatically generated list of communications and payments occurring between the participant and the MLTC.
Insurance Contribution Line Items and Consolidations	A person's insurance contributions to his or her employer during a period of employment, as well as groupings of these contributions within an insurance return period. Insurance contribution records are automatically recorded for a person when the person's employer submits insurance returns.
Notes	Notes allow a user to store additional information regarding a person. Individual notes may be secured so that they can only be accessed by certain users. A note history is automatically maintained for all notes.
Relationships	Relationships are the personal or familial relations between a person participant or prospect person participant and another person, e.g., spouse, sibling. When a relationship is added for a person participant or prospect participant, the system automatically adds a reciprocal relationship for the related person.
Special Cautions	Allows users to be cautioned of any issues relating to a client such as behavior, health, or safety issues. Users are kept informed of special situations regarding clients via a special caution icon link, displayed on the client's home page. The complete list of special cautions and associated details can be accessed via this link.
Tasks	A task is an instruction to carry out an item of work. Cúram Workflow tasks may be created automatically by the system or manually by a user. Tasks that are associated with a particular client are displayed in the client's list of tasks.

<ELG008, ELG085, ELG109, ELG164, ELG165>

Case Creation

Cúram includes business services that are designed to streamline the process involved in creating and maintaining cases. A case may be created for a client already registered on the system. Alternatively, a case worker has the option of registering the client when creating the case. Cases may be created by a case worker through a manual registration process or a workflow, with applicable business rules, can be used to automatically create and assign a case. <ELG091>

During the creation of the case, the user can choose the type of case involved, the expected outcome of the case, and other basic information relating to the case. When a case is created in Cúram, a unique case ID number is automatically assigned to the case, which may be used for tracking the case and as a reference for participants involved in the case. The screenshot below shows the home page of a Cúram Integrated Case (Figure IV-15). <ELG092, ELG094, ELG096>

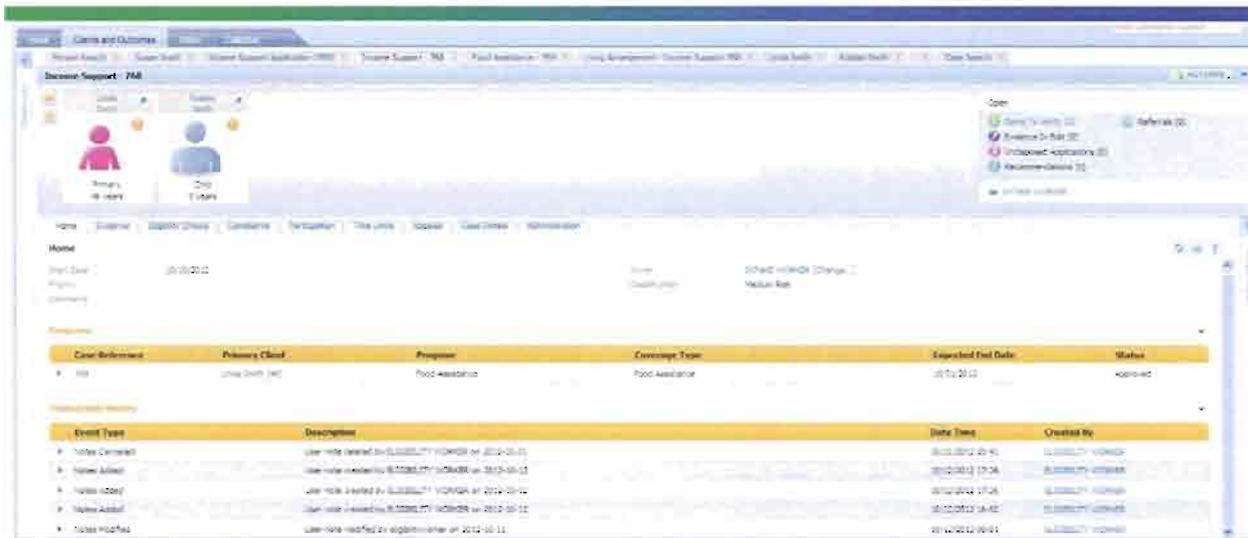

Figure IV-15: Cúram Integrated Case Home Page

IBM Cúram supports the management of the various other “participants” affiliated with a case. Case participants also include any nominees, contacts, and correspondents on the case.

Case “members” are registered individuals added to an integrated case for the purpose of determining their eligibility for benefits and services. Each person who is part of the same household is assigned a case member role within an integrated case. Note that changes in household makeup may require that a new person be added to an existing case. Additionally, changes in the household composition will trigger redeterminations for all individuals currently receiving assistance from the Department. <ELG093, ELG140>

Case Maintenance

Once a case has been created, authorized users with appropriate security rights may update case details and carry out maintenance as required over the lifetime of the case. Cúram provides comprehensive functionality to allow users, as well as automated processes, to manage case details. The following table provides a listing of the information that can be captured and maintained using the *SmartPro MedEE* case management functionality. <GEN074, OPS038, OPS039>

Table IV-5: Attributes Maintained for Cases

Feature	Functions
Case Participants	Case Participants are the various stakeholders involved in a case, for example the individuals, providers and other contacts relating to a case. They are added by the system automatically by virtue of their role in relation to a case.
Attachments	Attachments are electronic documents that are linked to the case, associated with clients and communications on the case including, for example, scanned licenses or legal documentation.
Communications	Communications are the correspondence between the organization and participants on the case, including letters, emails and phone calls.
Events	Events are significant milestones and events relating to the case life cycle. Such events may be created automatically by the system as a result of some action that

Feature	Functions
	has been carried out on the case (e.g. case approved, case suspended, case closed, etc.) or they may be created directly by a system user (e.g. case reviews, referrals, and calendar activities).
Notes	Notes are used to provide additional information about a case and to help a user see the progress history for a case. Notes can be entered by any user that is authorized to maintain the case. They can also be created by the system as a result of specific events occurring on the case. The details of a note are entered by users in free text format. Notes may be assigned a sensitivity rating so that the note can only be accessed by certain users. All modifications to a note are maintained so that a history of the note details is preserved, including note version, the time and date the note was entered on the system, and the user who made the note modification.
Related Cases	Related cases are cases in the system that have something in common with the case being viewed. Case relationships are automatically added by the system where appropriate and can also be manually created by a caseworker.
Tasks	In Cúram, a task is an instruction to carry out an item of work. Cúram Workflow tasks may be created automatically by the system or manually by a user. Tasks that are associated with a particular case are displayed in the Tasks list.
User Roles	These are users in the system who are assigned as either the case owner or case supervisor (or both). A single user may be assigned to both roles or different users may occupy each role.
Assessments	Assessments are simple rule-based determinations of specific characteristics relating to a client, for example medical assessments or at-risk assessments.
Contracts	A contract specifies a case member's responsibilities with respect to services or products received as part of the integrated case.
Products	Products are the programs that are being delivered as part of an integrated case.
Outcome Plans	Outcome plans are used to manage a client or household towards achieving specific goals, in order to improve their circumstances. They are created using the optional Cúram Outcome Management module.
Financials	The financials options display details of payments made, and bills charged in respect of product delivery cases.
Deductions	Deductions allocate a portion of a benefit payment to a third party or a debt.
Evidence	Evidence data is used by Cúram to determine eligibility and entitlement for a case. This option allows a caseworker to capture and manage the personal and circumstantial data (evidence) relating to a client and their household.
Certifications	Certification confirms that only certified cases and certified periods are paid. Certifications are proposed periods of eligibility that are used to validate evidence. For example, if evidence is entered for a six month period but only three out of the six months are certified, the evidence entered for the remaining three months will not be validated until it is certified.
Appeals	Permits authorized users to view details of any Appeals cases that have been created.

The case home page contains options that allow users to modify summary case details and to carry out actions such as marking the case as an item of interest, and moving the case through the stages

of the case life cycle. Users can also view a list of “recent transactions” on the case, providing users a convenient audit trail of pertinent events on the case.

Case Searching

Cúram provides case searching capabilities to allow users to quickly locate cases within the system. Cúram case searching functionality allows users to search for cases based on a range of criteria, such as client name, client reference number/ID, case status, or by case reference number. Case search results may indicate that an existing case should be used (based on business rules), instead of registering a new case. For example, a client may already have an existing closed or inactive case that can be re-opened. The *SmartPro MedEE* solution will also include compound search functionality, utilizing search criteria that may go across multiple participants (e.g., names of both a parent and a child). Rules will be included to process compound searches to define appropriate search results. <ELG087, ELG095, ELG140, ELG161>

Cúram also supports the concept of saved searches referred to as “case queries”. A case query enables a case worker to choose specific case search criteria that is important to them and they can then save the criteria used in the search as a personal query. This query can be run and rerun without the case worker having to specify the criteria each time.

Case Life Cycle

Cúram allows a case to go through a series of defined steps (i.e., a “life cycle”) to ensure that the case is properly processed. By default, when a case is created in Cúram its status is set to “open”. Thereafter the case status may change depending on the actions carried out on the case and the workflow processes that have been defined for the particular case type. For example, cases may have statuses such as “submitted”, “rejected”, “approved” or “active”. Some programs may involve complex steps and work processes throughout the case life cycle whereas other programs may have a very simple life cycle. Cúram supports the ability to have specific life cycles and workflows associated with specific case/program types. Attributes of a case may affect the behavior of workflows (e.g., ‘sensitive’ cases may require special handling). When a workflow encounters a special situation indicator, a task can be generated for the appropriate case worker, offering an opportunity for the case worker or other authorized staff to override the process associated with the indicator. <ELG109, ELG110>

Cases may be closed at any time by a suitably authorized user, for example if a case was opened in error. Typically, a case is closed after a number of intermediate steps, at the end of which some outcome is achieved in respect of the case, for example, completion of an investigative process.

Throughout the life of the case, Cúram provides the ability for authorized users to carry out various actions on the case including the assignment of the case to other users. At each stage during the case life cycle, or where significant events occur on the case, Cúram notifies the relevant users via alerts (and where user action is required using task capabilities), so that the relevant caseworkers, supervisors or other MLTC workers are kept up to date on the progress of the case, along with any obligations they may have in relation to the case. Similarly, case participants, such as the client,

providers or contacts will be notified of case related obligations or events via email or through correspondence notices created automatically by the system.

Medicaid Eligibility

Requirements Addressed:

NOT026

OPS002, OPS009, OPS010, OPS056, OPS057, OPS058, OPS059, OPS060, OPS061, OPS062, OPS064, OPS065

The *SmartPro MedEE* eligibility and enrollment solution determines eligibility and entitlement for public medical assistance programs (Medicaid and CHIP), as well as potential eligibility for Federal health insurance assistance subsidies. The *SmartPro MedEE* Public Self Service portal, in support of a no-wrong door approach, is accessible from locations with Internet access and will provide the citizens of Nebraska with the ability to access information, screen for potential eligibility, and apply for programs and benefits offered by the Department as well as Federal health insurance subsidies (Federal premium tax credits, and cost-share reductions); Community-based or external organizations will also have the ability to perform these activities on behalf of the individual. Department-specific information such as office locations and hours are accessible through the portal. Citizens can also access this information, request program screening and initiate program applications, and redeterminations through other channels. In all cases, the *SmartPro MedEE* solution will support the full process from initial contact through eligibility determination or receipt of information requested. It provides the facilities and rules to collect and manage the evidence relevant to the health insurance plans and programs supporting automated program eligibility and entitlement determinations for such programs. Additionally, the *SmartPro MedEE* solution supports a staggered or phased approach to program implementation. For example, the MLTC can implement a solution that supports eligibility determinations for Medical Assistance and Federal health insurance subsidies. At a later date, the Department can incorporate eligibility determinations and case management capabilities involving SNAP, TANF and other programs. <ELG016, ELG028, ELG065, ELG151, GEN007, GEN008, OPS009>

The *SmartPro MedEE* solution will interface with external applications as directed by the Department. Interfaces can be used to obtain verifications and can also be used to exchange details concerning client eligibility. For instance, *SmartPro MedEE* can interface with legacy applications currently responsible for determining eligibility for SNAP and TANF and external applications

responsible for providing services that are designed to assist the person or household until determined eligible for Department-sponsored benefits. This exchange will serve to increase the accuracy of benefit determinations and decrease fraud by providing accurate timely information to multiple agencies issuing benefits to common clients. The interface with the Nebraska Financial and Accounting system will interface at the Financial Instruction Line Item (ILI) level and will serve to increase accuracy of benefit determinations as well as support financial management and reporting at all levels throughout the State, including reporting and data exchanges with the Federal government. <GEN023, GEN052, OPS002>

Integrated Eligibility

The IBM Cúram Eligibility and Entitlement Engine applies program rules to a household's evidence (data) in order to determine eligibility and entitlement. *SmartPro MedEE* will evaluate all the evidence and perform the necessary computations that determine the program entitlement(s) for all named individuals as well as the household. The ability to determine household units – that may vary across programs – is a capability critical to Medicaid and families affected by the ACA. Household units for the streamlined process endorsed by the ACA are based on a taxpayer and his/her dependents as reported on a Federal income tax return. Household composition for other programs is determined differently. The IBM Cúram for Medical Assistance solution's Eligibility and Entitlement Engine is designed to determine different household units according to program rules including, the eligibility and coverage options available to those household members:

- Households that include members eligible for CHIP and Qualified Health Plans administered through the Federally-facilitated Marketplace (FFM);
- Households that include members who have specialized needs and are eligible for Medicaid under traditional rules as well as members that qualify for Federal subsidies through the FFM;
- Households that include employees;
- Households that experience changes in composition, income, and/or employment that move members across public medical assistance programs and the FFM; and
- Households that include members eligible for other human services programs with a subset of those members eligible for different health insurance coverage options.

<ELG104, OPS065>

Using the eligibility and entitlement process described above, when a client requests assistance the system gathers the necessary information, determines different assistance units in the household and their eligibility for various programs (MAGI-based Medicaid and CHIP, non-MAGI based Medicaid, potential eligibility for Federal subsidies). Additionally, the *SmartPro MedEE* solution can provide a Medicaid enrollment roster to the Marketplace at pre-determined interval. <GEN064, ELG107>

MAGI Medicaid Eligibility Determination

To provide coordination of eligibility and continuity of coverage across the different healthcare programs, the ACA stipulates how eligibility is determined for Medicaid and CHIP to align with the income-tax based method for Federal subsidies. The ACA established new definitions for income,

Modified Adjusted Gross Income (MAGI), and determining household composition based on the number of personal exemptions that an individual claims on a tax return with some exceptions.

Certain types of income are treated differently between tax code and Medicaid eligibility rules, such as:

- Social Security benefits,
- Lump sum payments,
- Educational scholarships and grants, and
- American Indian and Alaska Native income.

The solution must apply rules, including MAGI, to a household's data in order to determine eligibility and entitlement. *SmartPro MedEE* evaluates the evidence and carries out necessary computations to determine program entitlement(s). The ability to determine household units varying across programs is critical. Household units for the streamlined process endorsed by the ACA are based on a taxpayer and his/her dependents as reported on a Federal income tax return. Household composition for non-MAGI Medicaid and other programs is determined differently. The *SmartPro MedEE* solution can and will determine different household units according to program rules, and the eligibility and coverage options available to those households.

Treatment of Income and Resources

Income and resources are also factored into eligibility determinations. Policy will determine how income and resources are treated at the program level. Rules will assess the household structure. As part of the review process, types of income and resources entered are verified in order to accurately apply income and resources to both the individual and case. For example, income and resources may be included, excluded, or exempt depending on program rules. The *SmartPro MedEE* solution will assess and treat the income and resources in accordance with program-specific policy. The treatment of these items, and all other data, is detailed in the eligibility determinations and calculations and is also detailed in the notifications issued to the client, client and/or authorized representative. For instance, *SmartPro MedEE* must consider transfer of resources (type of resource, date of transfer) when determining eligibility for Long Term Care. Improper transfer of resources may result in an individual's ineligibility or suspension from a program. *SmartPro MedEE* will initiate and track all periods of ineligibility and program suspensions resulting from an improper transfer of resources. *SmartPro MedEE* will maintain a comprehensive, detailed history of all eligibility determination at the individual and case levels. <ELG050, ELG054, ELG061, ELG063, ELG064, ELG066, ELG069, ELG156, ELG160, ELG170, GEN054>

Certification periods vary based on programs and may also fluctuate based on the instability of the household or likelihood of change. *SmartPro MedEE* will assign a certification period based on program rules – usually between one and 12 months. It will also monitor the eligibility period in order to notify the assigned worker, client and/or authorized representative of the upcoming redetermination requirement that must be addressed in order to continue eligibility.

Redeterminations that must occur as the result of reported changes or conducted for other reasons prior to the end of the certification period are processed by *SmartPro MedEE* by considering all current, verified information and applying that against applicable program rules. Eligibility determinations and required notices and documents are generated as the result of any eligibility

determination associated with applications and redeterminations. *SmartPro MedEE* rules will accommodate MLTC's policy which allows for a reconsideration period or segment of time during which the client will not be required to complete a new application if the overdue redetermination form is received directly by the Department or processed as an online via the Public Self-Service portal. <ELG048, ELG049, ELG068, GEN048, GEN049>

IBM Cúram Eligibility and Enrollment for a Federally Facilitated Marketplace

IBM Cúram Eligibility and Enrollment delivers out-of-the-box functionality in support of the Department's implementation of the requirements for a Federally Facilitated Marketplace (FFM).

CMS has defined seven critical success factors to help FFM states understand their responsibilities for working with the FFM. These seven critical success factors are:

CMS Critical Success Factors

1. Ability to accept application data: The State must accept the streamlined application.
2. MAGI rules: The State must be capable of determining eligibility under MAGI rules.
3. MAGI conversion: The State must be capable of converting income data to MAGI.
4. Provide thresholds and flexibilities: The State must provide to CMS, via MACPro, State specific thresholds such as FPL limits.
5. Connections to FFM: The State must provide the required end points for interacting with the FFM.
6. Connections to Hub: The State must implement the required connections to the Federal Data Services Hub, for example to automatically verify data captured through the State's streamlined application.
7. Minimum Essential Coverage (MEC) check: The State must provide client enrollment status under State medical programs, such as Medicaid or CHIP.

The *SmartPro MedEE* solution supports the MLTC's ability to accept a streamlined application, verify data received against the state and federal data hubs, determine eligibility using MAGI rules, and, when required, interact with the FFM to hand off applications to the FFM or accept applications from the FFM. The latter will occur when the FFM assesses potential eligibility under MAGI or traditional Medicaid and CHIP rules. Verifications received electronically will be reflected and, if received from a trusted source will automatically update individual/case information in accordance with Department instruction. *SmartPro MedEE* can be configured to notify the assigned worker or designated staff in the event that a discrepancy between available data and newly received data occurs, prompting the worker to review and take appropriate action. All updates and transactions will be recorded and maintained in the client's/case history. <ELG002, ELG057, ELG071, GEN011, GEN012, OPS010>

IBM Cúram Eligibility and Enrollment provides the Department with the components needed to satisfy these seven critical success factors. The solution provides the streamlined application, the MAGI rules, the MAGI conversion logic, interfacing with the federal data hub and, subject to completion of the design and implementation of the account transfer interfaces by the FFM, will provide the State side of these interfaces. The *SmartPro MedEE* solution will serve as the single

endpoint between the FFM and the Federal Data Hub as depicted in Figure IV-16: IBM Cúram Illustration diagram.

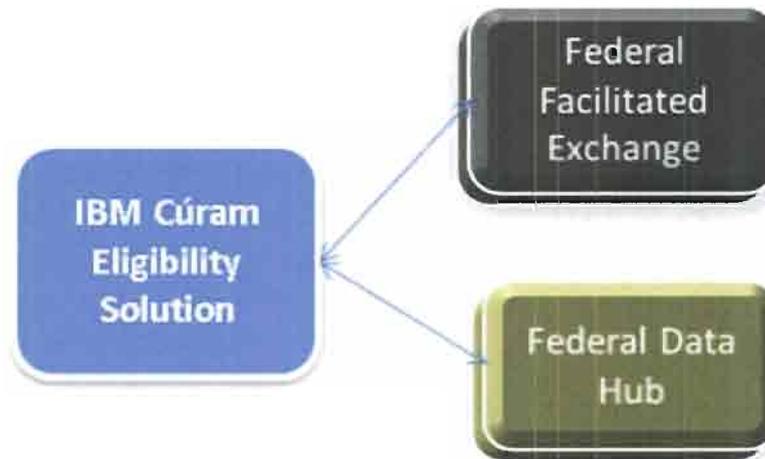

Figure IV-16: IBM Cúram Illustration

The application transfer interfaces, known as “Account Transfer business services” will operate through the federal data hub. These business services will operate in both directions transferring application data to the State’s Medicaid/CHIP systems from the FFM, and from the State’s Medicaid/CHIP systems to the FFM. All referrals from the FFM to the State Medicaid/CHIP systems will be sent to a single endpoint. The receiving entity at the State must coordinate the referral between various agencies and send a response back to the FFM. The account transfer interface will be triggered by the FFM when:

- The applicant is assessed as potentially eligible for Medicaid/CHIP based on MAGI (by FFM).
- Applicant is referred by FFM to Medicaid for non-MAGI eligibility determination based on screening questions.
- Individual requested full determination of eligibility for Medicaid/CHIP
- Qualified Health Plan Enrollee (with APTC/CSR) assessed as potentially eligible for Medicaid or CHIP during periodic data matching or self-reported changes.

The account transfer interface will be triggered from the State when:

- A Medicaid/CHIP Applicant is determined ineligible for Medicaid/CHIP (by State) and is referred to the FFM.
- A Medicaid/CHIP Recipient loses eligibility for Medicaid/CHIP (as determined by State) and is referred to the FFM.

The exchanges of client data between the FFM and MLTC and subsequent eligibility determinations are seamless to the client. The *SmartPro MedEE* solution will generate detailed notices to all clients detailing eligibility determinations (denied, eligible, termination). <ELG010, ELG156, GEN054>

The IBM Cúram Match to CMS Critical Success Factors table documents in further detail how the solution satisfies the seven critical success factors for the State of Nebraska. <ELG112>

Table IV-6: IBM Cúram Match to CMS Critical Success Factors

Ability to accept application data	The IBM Cúram solution includes the complete streamlined application. It is implemented as a configurable script of questions and presented to the user in an intuitive and guided manner.
MAGI rules	The solution is delivered with MAGI rules for both initial eligibility and ongoing case management.
MAGI conversion	MAGI conversion is accommodated through configurable rules logic included in the solution.
Provide thresholds and flexibilities	Configuration capabilities allow state thresholds and flexibilities to be applied to the solution.
Connections to FFE	The IBM Cúram solution acts as the required single endpoint for the FFM, providing the four account transfer interfaces needed by states: <ul style="list-style-type: none"> • H15 Account Transfer: FFE to Medicaid/CHIP • H16 Account Transfer: Medicaid/CHIP to FFE Response • H17 Account Transfer: Medicaid/CHIP to FFE • H18 Account Transfer: FFE to Medicaid/CHIP Response
Connections to Hub	The IBM Cúram solution provides the required connections to the Federal Data Services Hub. Maryland's exchange, powered by IBM Cúram, is the nation's first state-based exchange to submit information to – and receive information from – the Federal Hub.
MEC check	The IBM Cúram solution's connections to the Federal Data Services Hub facilitate the required Minimum Essential Coverage (MEC) check, providing client enrolment status for Medicaid and CHIP.

Over time, if a decision is made to move from the FFM to a State Exchange model, *SmartPro MedEE* provides a flexible solution to support that decision. IBM Cúram provides capabilities for integrating with a State Exchange including the rules logic for Advance Premium Tax Credit and Cost Sharing Reduction calculations. Shopping portal integration with best of breed insurance shopping portal vendors is also feasible with IBM Cúram. Furthermore, the IBM Cúram solution provides a complete portal solution for capturing new claims and changes in circumstance.

Further, Nebraska will be able to leverage project artifacts as appropriate from other states implementing the IBM Cúram Eligibility, Enrollment, and Case Management solution for both their MAGI and non-MAGI projects. Today, North Carolina has shared their project plan, best practices, and lessons learned in implementing SNAP, cash assistance and Medicaid eligibility with several other states and is willing to share similar project design documents, project plans, configurations, and extensions to IBM Cúram with other clients.

Non-MAGI Medicaid Eligibility Determination

The solution must provide rules to determine eligibility for the full spectrum of medical assistance programs that exist today, listed below, and also address the revised spectrum of medical programs as a result of ACA consolidations. Covered programs in the solution today, under pre-ACA or 'traditional' processing include the list below.

Pre-ACA Medicaid coverage types

- Mandatory Categorically Needy groups

- Low Income Families with Children (LIFC – includes Transitional and Extended Assistance)
- Aged Blind and Disabled (ABD)
- Pregnant Women
- Newborn
- Children (under and over 6)
- Title IV-E Foster Care
- Title IV-E Adoption
- Emergency Medical Assistance for the following:
 - Low Income Families with Children
 - Aged Blind and Disabled
 - Pregnant Women
 - Newborn
 - Children (under and over 6)
 - Title IV-E Foster Care and Title IV-E Adoption
- Cost Sharing Medical Assistance
 - Qualified Medicare Beneficiaries (QMB)
 - Specified Low-Income Medicare Beneficiaries (SLIMB)
 - Qualified Individual (QI-1)
 - Qualified Disabled Working Individual (QDWI)
- Optional Categorically Needy groups
 - Long Term Care
 - Refugee
 - Breast and Cervical Cancer (BCC)
 - Tuberculosis (TB)
- Mandatory Medically Needy
 - Medically Needy Children
 - Medically Needy Pregnant Women
 - Emergency Medically Needy Children
 - Emergency Medically Needy Pregnant Women
- Mandatory Medically Needy with Spenddown
 - Medically Needy Children with Spenddown
 - Medically Needy Pregnant Women with Spenddown
 - Emergency Medically Needy Children with Spenddown
 - Emergency Medically Needy Pregnant Women with Spenddown
- Children’s Health Insurance Program

Post-ACA Medicaid coverage type consolidations

The revised spectrum of medical programs as a result of ACA consolidations is show below.

Pre-ACA Medicaid coverage types	Post-ACA Medicaid coverage types
LIFC	Replaced by ACA category (parent/caretaker or children)
ABD	No change with ACA
Title IV-E Foster Care/Adoption	No change with ACA
Newborn	Replaced by ACA category (children)
Children	Replaced by ACA category (children)
Pregnant Woman	Replaced by ACA category (pregnant woman)
Medically Needy Children	No change to Medically Needy with ACA
Medically Needy Pregnant Woman	No change to Medically Needy with ACA
Medicare Cost Sharing Programs (QMB, SLMB, QI-1, QDWI)	No change with ACA
BCC	No change with ACA
Refugee	No change with ACA
Emergency LIFC	Replaced by ACA category (parent/caretaker or children)
Emergency ABD	No change with ACA
Emergency Title IV-E Foster Care/Adoption	No change with ACA
Emergency Newborn	Replaced by ACA category (children)
Emergency Children	Replaced by ACA category (children)
Emergency Pregnant Woman	Replaced by ACA category (pregnant woman)
Emergency Medically Needy Children	No change with ACA
Emergency Medically Needy Pregnant Woman	No change with ACA
Emergency Medically Needy Children with Spenddown	No change with ACA
Emergency medically Needy Pregnant Woman with Spenddown	No change with ACA
Medically Needy Children with Spenddown	No change with ACA
Medically Needy Pregnant Woman with Spenddown	No change with ACA
LTC	No change with ACA
CHIP	Modified with ACA

<ELG007, GEN014>

The IBM Cúram for Medical Assistance component of our solution features cascading eligibility, as encouraged by the Centers for Medicare and Medicaid Services (CMS). Cascading eligibility refers to the process for determining program eligibility based on a hierarchy of the spectrum of Medical Assistance programs. Administrators can configure the hierarchy and prioritize programs to meet policy objectives and maximize Federal funding. <GEN059>

When applying for medical assistance, applicants, households, or case workers do not have to choose a specific medical program. Information about the household is entered and an eligibility check is requested. Cascading eligibility determines the household composition and executes the rules for the program with the highest priority first, followed by the rules for the program of next

highest priority, and so on until the best possible fit is found for the individual or family. When eligibility is found for more than one program – such as an ABD and QMB combination – both programs are offered for continued eligibility determination. This also supports efforts to address dual-eligibles and provide opportunities to ‘end the disconnect’ between the two programs by integrating care for high-expense users of medical services. <ELG053, GEN062>

The goal of *SmartPro MedEE* is to assess the individual’s and household’s verified circumstances in order to determine eligibility for the program(s) most beneficial to the client and client household. All confirmed circumstances will be applied against program rules. MLTC will set a hierarchy of programs that *SmartPro MedEE* will access when determining eligibility. For example, programs that fall within the Mandatory Categorically Needy Medical Assistance category offer a higher level of benefit than those that fall within the Medically Needy Medical Assistance category. *SmartPro MedEE* will follow that hierarchy issuing an eligibility determination for the program that will offer the individual the most beneficial benefit. Given this, it is possible for members of the same household to receive different benefits based on the situation and the income and resources, for example, which must be factored in to the individual eligibility determination. Changes in circumstances may result in an automatic eligibility redetermination that could impact the individual’s eligibility. The system will automatically determine the eligibility, end date eligibility for one program/category and set a begin date for another category of assistance in accordance with policy. For instance, *SmartPro MedEE* receives information that employer-sponsored coverage will be ending 1/31/2014, *SmartPro MedEE* will set the begin date for coverage for eligibility household members effective 2/1/2014. The status of each individual is updated and a complete history of all changes is maintained as part of the individual and case historical record. All changes are automatically assessed by *SmartPro MedEE* to determine the impact on all household members however; a change in benefit eligibility for one individual does not automatically impact the eligibility of other members of the household. A disposition workflow process will be included such that primary and secondary reviewers participate in a disposition and a hold will be released following a secondary review. Detailed notification of all eligibility determination results, at application, redetermination or as a result of a change, is automatically prepared for distribution to the client or client representative. <ELG001, ELG030, ELG031, ELG137, GEN044, GEN045, GEN065, OPS009, OPS056, OPS057, OPS058, OPS060, OPS061, OPS062, OPS064>

Long-term Care: Cost of Care Calculation, Transfer of Assets Assessment, and Spousal Impoverishment

IBM Cúram Long Term Care Medical Assistance supports three Medical Assistance coverage types that provide coverage for individuals who require an institutional level of care over an extended period of time: Long Term Care, Medically Needy Long Term Care, and Medically Needy Long Term Care with Spenddown. Long Term Care refers to the medical, social, personal care, and supportive services needed by people who have lost some capacity for self-care because of old age or a chronic illness or a condition. This definition generally excludes medical care for acute conditions; however, post-acute care, such as skilled nursing care and home healthcare, is often classified as long-term care. <ELG060>

Unlike other Medical Assistance coverage types, the full liability for nursing home or waiver care is not usually completely incurred by the Medical Assistance agency, in this case, MLTC. The

institutionalized individual must usually contribute to their cost of care. IBM Cúram Long Term Care Medical Assistance calculates the amount paid by the institutionalized individual based on their total monthly income with some deductions made for personal needs, family dependents, shelter allowances, and income. <ELG059>

In Long Term Care, an individual must declare information about resources they, their spouse, or any individual acting on their behalf have transferred to another individual within a specified period of time prior to application; known as the 'look-back period'. *SmartPro MedEE* collects information required to determine if the individual transferred the resource specifically in order to qualify for Long Term Care Medical Assistance, in which case they would be ineligible for a period related to the invalid transfer amount. The look-back period is a constant time frame of 60 months. *SmartPro MedEE* will track the individual's period of ineligibility resulting from an improper transfer of resources. <ELG172>

For an individual with a community spouse, special provisions called Spousal Impoverishment provisions apply to individuals who became institutionalized after 1989. The purpose of this provision is to allow the community spouse to keep some of the institutionalized individual's resources as determined on a specific date (assessment date). Under spousal impoverishment provisions, an institutionalized individual may receive Long Term Care Medical Assistance if he or she agrees to bring his or her resources below the resource limit by transferring them to his or her spouse within a specified time known as the 'protected period'. Spousal Impoverishment calculations are performed by rules. The system determines the value of all countable assets belonging to the institutionalized individual and the community spouse on a specific date called the Assessment Date. The rules determine an appropriate spousal share for each spouse. Generally, the spousal share is half the couple's resources on the assessment date; however, there are limits and if the spousal share is below the minimum or above the maximum, the spouse's share may be increased or decreased. This is called the Community Spouse Share. If the institutionalized individual's resources are less than the resource limit, then the individual is eligible and no protected period is required. If the institutionalized individual's resources are over the limit (usually \$2000), the resources are compared to the resource limit plus the Community Spouse Share. If this resource test is passed, resources must be transferred.

In all Long Term Care situations, should the institutionalized individual move or change placements the impact of this change will be assessed by *SmartPro MedEE* and eligibility results reflected in the client correspondence issued. All changes in placement as well as any and all changes in eligibility are tracked by *SmartPro MedEE*. <ELG062>

Spenddown

Spenddown is a Medical Assistance term used for persons whose income and assets are above the threshold for MLTC's designated medically needy criteria, but are below this threshold when medical expenses are factored in. The difference between the individual's gross income less deductions and the actual income limit for the particular Medical Assistance program is called the Spenddown amount. The *SmartPro MedEE* solution calculates Spenddown on a period basis, and both eligibility and the Spenddown amount are re-determined each period.

An individual can meet the Spenddown amount by submitting allowed medical expenses to reduce/meet the Spenddown amount.

When the individual meets this Spenddown amount, they can receive Medical Assistance coverage from the date that Spenddown was met until the end of the specified Spenddown period.

Spenddown functionality covers the following groups of people that are Medically Needy if they meet income and resource eligibility guidelines or Spenddown to the eligibility guidelines:

- All pregnant women
- All individuals under 18 years of age
- Women who were medically needy during pregnancy must remain eligible for Medicaid services related to the pregnancy for 60-days beginning on the date of her child's birth.
- Individuals receiving long term care. <ELG157>

Changes in Circumstances

Beneficiary changes occur frequently such as marital or employment status changes. The MLTC requires a system that allows it to track, maintain, and address those changes in client or individual information. The Public Self-Service Portal provides the option of reporting changes by accessing the Report A Life Event option on the Member home page. The *SmartPro MedEE* solution accepts specified changes linking to the appropriate case and notifies the assigned worker of the change. This option allows the client to describe the actual life event that is causing them to look for assistance, for example divorce, newborn, lost wages, and obtain a set of related recommendations.

The individuals' needs are assessed collectively in a member/family context - rather than in a program-driven manner, providing a tiered, integrated response that focuses on the needs of the member/family.

As changes in household circumstances occur, such as the birth of a baby or a change in marital status, the member must notify the Department to determine impact on eligibility for benefits (increase, decrease, or have the possibility of new benefits). Clients can report these changes using the Public Self-Service portal (Figure IV-17).

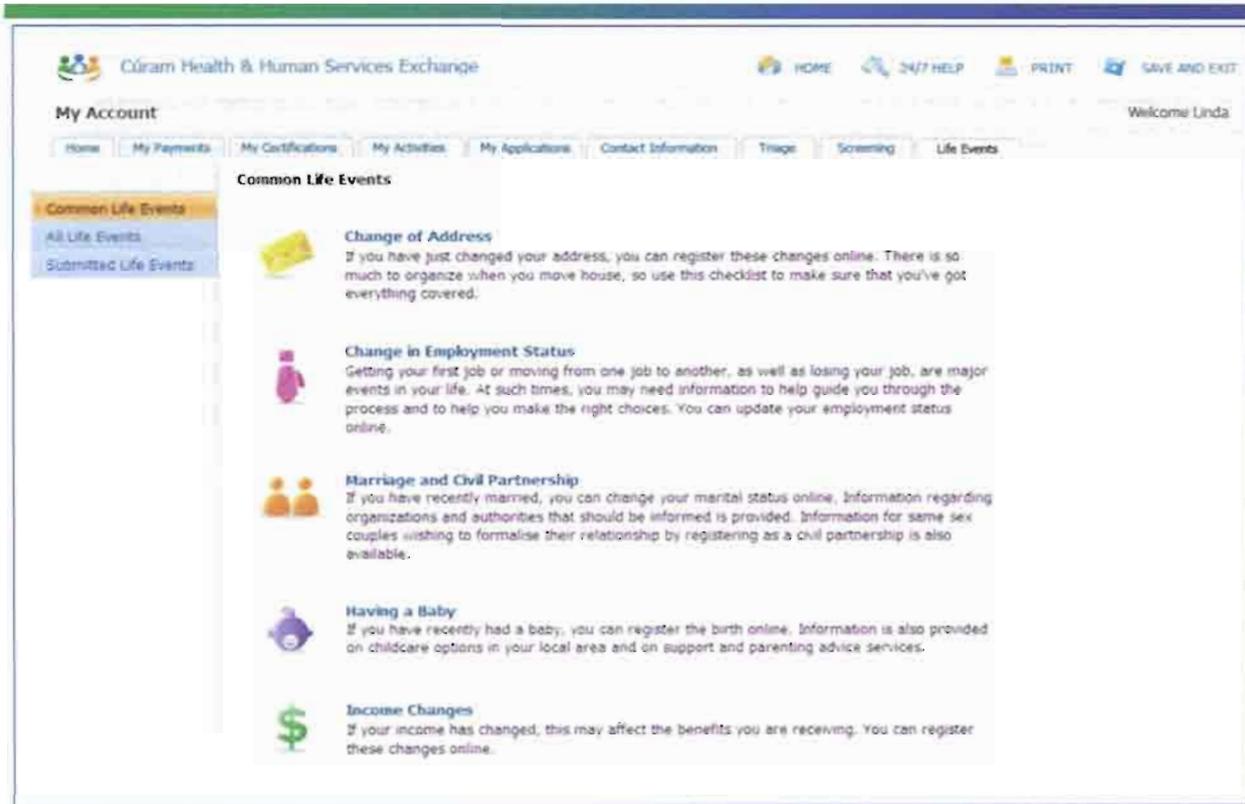

Figure IV-17: Common Life Events

The client will select the type of change being reported, for example - Change in Employment Status. As is the case when initiating the redetermination process, existing information available for the select individual will be presented to the person reporting the change. The person can then provide details concerning the change, save and exit. The reporter also has the ability to check to see what impact the reported change will have on eligibility and/or the level of benefits. <ELG027>

Online Member Account – Common Life Events. Easy to read and understand to encourage self-service.

Once entered and saved by the client, the assigned worker will receive notification of the reported change and the member will be informed of the verifications required. When the change in circumstance is verified, eligibility for active programs will be reassessed. If the change in circumstances is such that the individual and/or household may be eligible for additional benefits or services, the system will generate that message allowing the member to decide his/her next steps.

Reported changes that impact eligibility yet to be determined will keep the application in pending status. For ongoing cases, the eligibility and benefit level will continue at the present level until verification is received. Once recorded, the change will trigger redeterminations for future eligibility and benefits as well as for retroactive eligibility to confirm that benefits previously issued were accurate. If, in accordance with policy, a trial budget or trial eligibility must occur prior to a change in benefits going forward, the system will be configured to accommodate this process. <ELG012, ELG052>

Redeterminations and reassessments triggered as the result of verified changes in circumstances may result in a change in benefit status or level of benefits received. For example, an increase in income in excess of the allowable limit will close a case and possibly terminate a benefit for the household or a household member. This case closure may initiate a reassessment of Medicaid/Medical Assistance eligibility for household members. The system can be configured to trigger an eligibility termination action based on verification of non-payment of a required premium. Assigned workers or other authorized staff members have the ability to manually initiate a case action, such as a case closing if in line with program policy. In these situations the worker will be required to indicate the closure reason and date. *SmartPro MedEE* can also be configured to notify the worker. All actions – closing, withdrawal, denial – and associated reasons and action dates are maintained as part of the individual's eligibility history. <ELG037, ELG100, ELG102, GEN038, GEN039, GEN040>

An authorized business user can make changes such as a Cost of Living Allowance (COLA) rate adjustment or insurance premium adjustments. Given that these two examples could impact the eligibility profile of a large number of cases, this likely would be handled via mass change. <ELG058, ELG166, GEN042>

The *SmartPro MedEE* solution tracks verification timeframes as specified by program rules or in accordance with State protocol. Failure on the part of the applicant to verify information in a timely manner will result in denial of the application. A member's failure to verify information within the timeframe stipulated may cause a case to close based on program rules.

As eligibility determinations are issued, case and member information is automatically updated to reflect current information concerning eligibility including eligibility status, benefit amounts, certification and eligibility periods. <ELG008>

Presumptive Eligibility

Presumptive eligibility in Medicaid is an important strategy for improving access to early prenatal care for low-income pregnant women. Authorized providers (like local Public Health offices, clinics, and hospitals) determine when pregnant women are presumptively eligible for Medicaid and provide medical services when they first seek prenatal care. Access to this early prenatal care can lead to better birth outcomes, healthier babies, and reduced overall healthcare expenses.

In the *SmartPro MedEE* solution, authorized providers use the citizen-facing streamlined application to capture data, electronically verify information, and determine eligibility for Medicaid. If applicant information (e.g., citizenship, residency, and income) cannot be electronically verified, providers can manually verify information based on MLTC policy, and upload required verification documents with the application. Presumptive eligibility continues for a specified number of days as specified by the State.

Authorized providers have access to certain functionality on behalf of applicants they assist. For example, authorized hospital staff can access information on an applicant's application status and eligibility results.

Program Rules

Organizations such as the MLTC that are responsible for the administration of public assistance programs and benefits are often faced with changes in Federal, State or local regulations. The budget constraints resulting from these changes or environmental changes have an economic impact during a downturn or a natural disaster. These organizations must adapt to these situations quickly and efficiently in order to serve the individuals relying on the benefits and services they offer or coordinate. **SmartPro MedEE** will support the Department's need to rapidly, accurately and efficiently implement changes to policy or establish rules in support of a new program offering. Because the rules engine is self-contained these changes can be developed, tested and implemented without impact to system response times or modification to the system architecture. <ELG155, GEN006, GEN058, GEN059>

Authorized users, through the System's Administration feature, will be able to modify existing program rules without the intervention of technical staff through the pre-built Web interface. All program rules are time-sensitive meaning that they have an effective begin and end date. This feature facilitates eligibility determinations for multiple periods. For example, if the current month is June and the reported, verified change was found to be effective in May, **SmartPro MedEE** will apply that change to rules in effect for the period May through June. **SmartPro MedEE** will also compare benefits issued to the correct amount of benefits that should have been issued computing the difference. The worker will then receive notification of the benefit discrepancy in order to recoup on an overpayment or issue the balance of owed benefits. Taking that same situation, if a rules change occurred effective July 1, **SmartPro MedEE** will take the correct case circumstances, by applying the rules effective for May and June, and then against rules effective July 1 to determine eligibility, recalculate benefits and inform the worker of discrepancies. <ELG150, GEN015, NOT026>

SmartPro MedEE also supports MLTC that will determine eligibility and the benefit levels associated with the new program being implemented. Once activated, **SmartPro MedEE** will automatically determine eligibility for the new program based on Department instructions. In the case of a Medicaid or Medical Assistance program, MLTC will indicate the program's position in the eligibility hierarchy. <ELG076>

Program Maximums

Faced with budgetary constraints and considerations it is critical that the Department monitor program usage and expenditures. The **SmartPro MedEE** will support enrollment limits (caseload and/or expenditures). Out-of-the-box wait list capability will be used to manage applications for programs for which the enrollment limit has already been reached. Modifications are required to enforce enrollment limits (program level maintenance of enrollment limits, rules to check if enrollment max has been reached, processing of items on wait list), and to issue wait list notifications (added to and removed from wait list). <ELG158, ELG159>

Notices and Communications

Requirements Addressed:

ELG011, ELG015, ELG044

GEN016, GEN054

NOT001, NOT002, NOT003, NOT004, NOT005, NOT006, NOT007, NOT008, NOT009, NOT010, NOT011, NOT012, NOT013, NOT014, NOT015, NOT016, NOT017, NOT018, NOT019, NOT020, NOT021, NOT022, NOT023, NOT024, NOT025, NOT026, NOT027, NOT028, NOT029, NOT030, NOT031, NOT032, NOT033

OPS006, OPS027, OPS028, OPS029, OPS044, OPS045, OPS046, OPS047, OPS048, OPS049, OPS050

The *SmartPro MedEE* solution includes comprehensive notice management functionality, providing the required communication channels and intuitive management and, usage of those notices. Individuals and groups of applicants/beneficiaries will receive notices electronically and via traditional paper mechanisms in the *SmartPro MedEE* solution via the solutions' Communication Management and Workflow Engine features. These features provide the functionality to manage the complex processing and routing for the multiple channels of communications to internal and external users.

SmartPro MedEE, through the implementation of IBM Cúram Communication Management, supports multiple communication formats including mail, email, and fax with multiple documentation types through online or asynchronous methods. As part of the IBM Cúram out-of-the-box solution multiple reference templates are provided that are automatically or manually generated by users. Logic can also be built in to override automatic generation of a specific notice or benefit card as required. <OPS028>

The "Communication Template Examples" figure (Figure IV-18) provides a sample of the list of templates provided out-of-the-box. Generated communication documents utilize applicant/beneficiary, case or other user provided information including free form text. Generated notices may include letter notifications, benefit cards, or pre-populate form. These templates are available for transmitting to one or more recipients in single or mass mailing via batch in the *SmartPro MedEE* solution. Specific Nebraska branded, federally compliant, information will be incorporated into existing or new templates as required in both English and Spanish versions. <ELG044, GEN016, NOT005, NOT006, NOT008, NOT014, OPS027, NOT029>

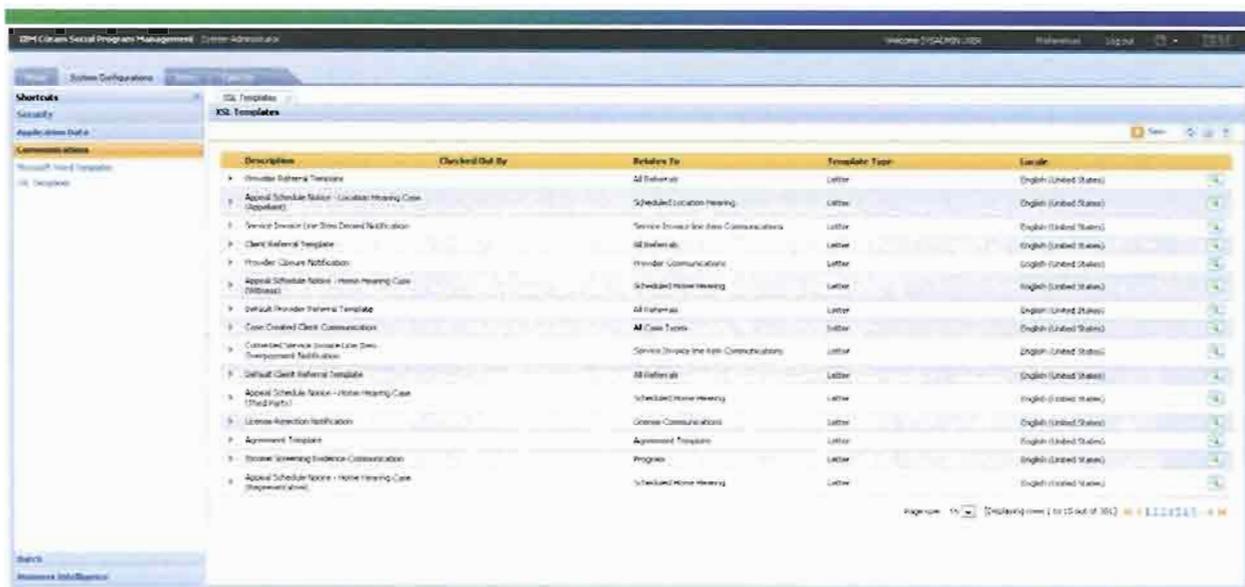

Figure IV-18: Communication Template Examples

The *SmartPro MedEE* solution’s administration portal provides the ability to administrate, upload and version communication templates within the solution. Authorized users may suppress usage of out of date or expired communication templates or upload new versions within the portal. Pro forma templates utilize standard FO-XSL templates that are stored and versioned within the Cúram data store. Each generation of a communication document within *SmartPro MedEE* is re-creatable to the original version or the generated version is optionally stored within a data store.

<NOT011, NOT012, NOT013, NOT024>

The *SmartPro MedEE* solution will utilize IBM Cúram’s Communication Framework to provide:

- Multiple locale and language notices and online notifications,
- Pro-forma generation,
- Email, fax and other communication methods,
- Bar-code incorporation into electronic and paper documents,
- No page limit notices,
- Grouped/Bundling noticing,
- Tracked generation of communications,
- Notification of change of eligibility,
- Scheduled notices based on program milestones, and
- Benefit card generation (including card replacements).

Notifications will be prepared and issued based on the client’s indicated preferred language and mode of communication. *SmartPro MedEE* will maintain a history of all correspondence and notices issued. Authorized users will have access to these notifications as needed. <ELG011, NOT004, NOT007, NOT020, GEN054, OPS029>

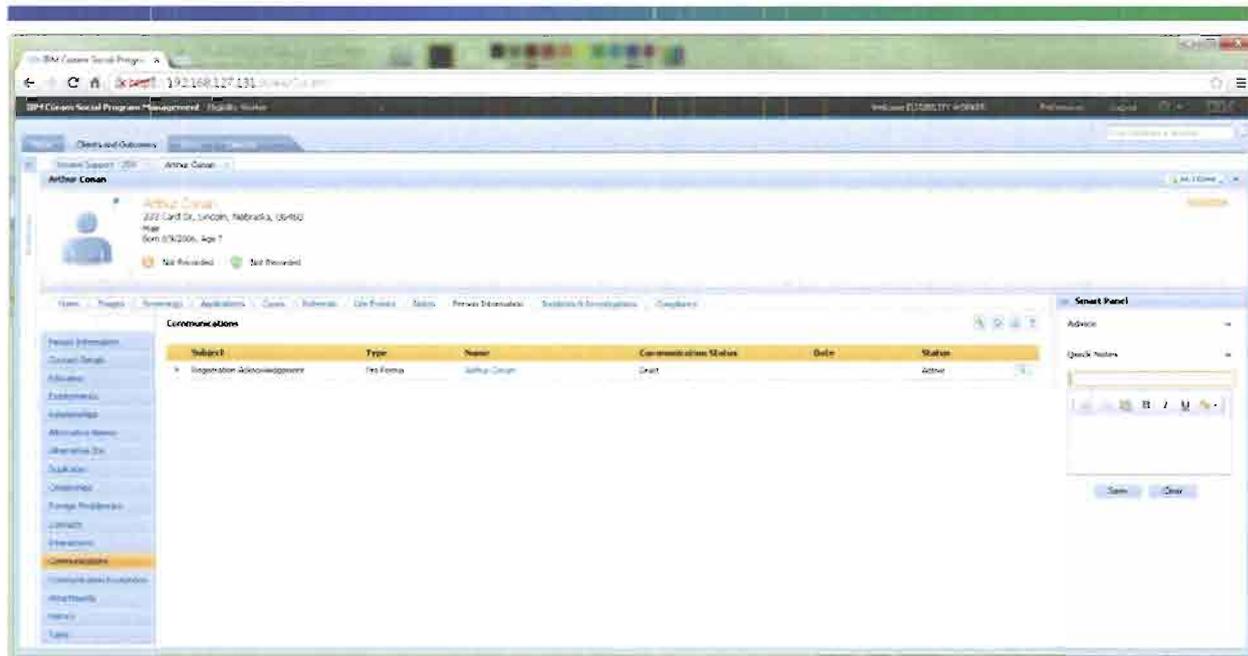

Figure IV-19: Communications Screen

Within the Communications sub-tab as shown on the Figure IV-19: Communications Screen available in applications, appeals, persons and program/case sections the authorized user may:

- Track notices with parties specific to the business process (application, case, program),
- Generate or regenerate notices,
- Sort notices by date or type,
- Delete a pending notice, and
- Identify source of notices, i.e., automatic or worker generated.

<NOT015, NOT019, NOT021, NOT022, NOT031, NOT032>

The IBM Cúram Workflow Engine will provide the business processing and event management to support automatic notice generation and task assignment related to notices. Referral tracking and task management will occur through the out-of-the-box provided referral process and Cúram Workflow related task management. Referrals will be automatically generated and tracked based on defined rules. Referrals can also be manually generated within IBM Cúram. Included in the referral workflow processing is the ability to monitor for subsequent action to a referral from the receiving entity. When certain types of data are captured, a referral workflow will be triggered notifying the specialized work unit. The referral type and target will depend on the type of data captured; e.g., employment and household changes, child-only Child Support Enforcement referrals.

<NOT027, NOT030, OPS044, OPS045, OPS046, OPS047, OPS048, OPS049, OPS050>

Notices to Applicants/Beneficiaries

The IBM Cúram solution has out-of-the-box functionality to automatically generate notices throughout the life of a case. The **SmartPro MedEE** solution will leverage and configure additional information as needed. A newly registered user will first generate an Adobe PDF version of their

application information available for printing or mailing to the applicant. A statement concerning the individual's rights and responsibilities as well as instructions to file an appeal may append the application or attach to another notice. External users registering within the *SmartPro MedEE* solution will indicate their preferred communication method; the system will use this information to determine the method of client contact. Additionally, Notices can be configured to provide the client/beneficiary with the Department's established protocol for addressing an information breach should that occur. A complete history of all communications sent and received is maintained for all individuals and cases. <ELG015, NOT001, NOT002, NOT003, NOT031>

Special situations may cause consumer notices to be generated such as in situations related to specific Cost Avoidance and Recovery areas (CSE, TPL, HIPPS, ERU, and Medical Subrogation). <OPS049>

As part of its out-of-the-box Case and Application lifecycle Cúram will set specific deadlines and milestones (i.e., logic flags) that will trigger notices to applicants/beneficiaries and possibly tasks to internal users. The *SmartPro MedEE* solution will generate client communications, automatically or on-demand by internal user, informing individuals of the need to provide missing information such as application fulfillment needs, missing verification information, enrollment status changes, or program requirements. Those deadlines and milestones will coordinate to the specific program rules and other relevant release dates. Since these notices are stored within the Communications screen internal users may review the existing communication in one location prior to or when directly interacting with a client, beneficiary and/or authorized representative.

<NOT009, NOT010, NOT016, NOT017, NOT018, NOT033, OPS006>

The *SmartPro MedEE* solution will provide a full renewal lifecycle providing notices as appropriate for each stage of interacting with beneficiaries. Beneficiaries and internal users will be able to see the stage of renewal along with a history of the interaction such as Life Events, Verifications and other related information.

<NOT023, NOT024, NOT025, NOT026, NOT027, NOT028, NOT031>

Outreach

In addition to online and paper notices applicants/beneficiaries may receive information specific to their situation via the Public Self-Service Portal. Information relevant to their household is available for display as demonstrated in Figure IV-20: Example External Screen.

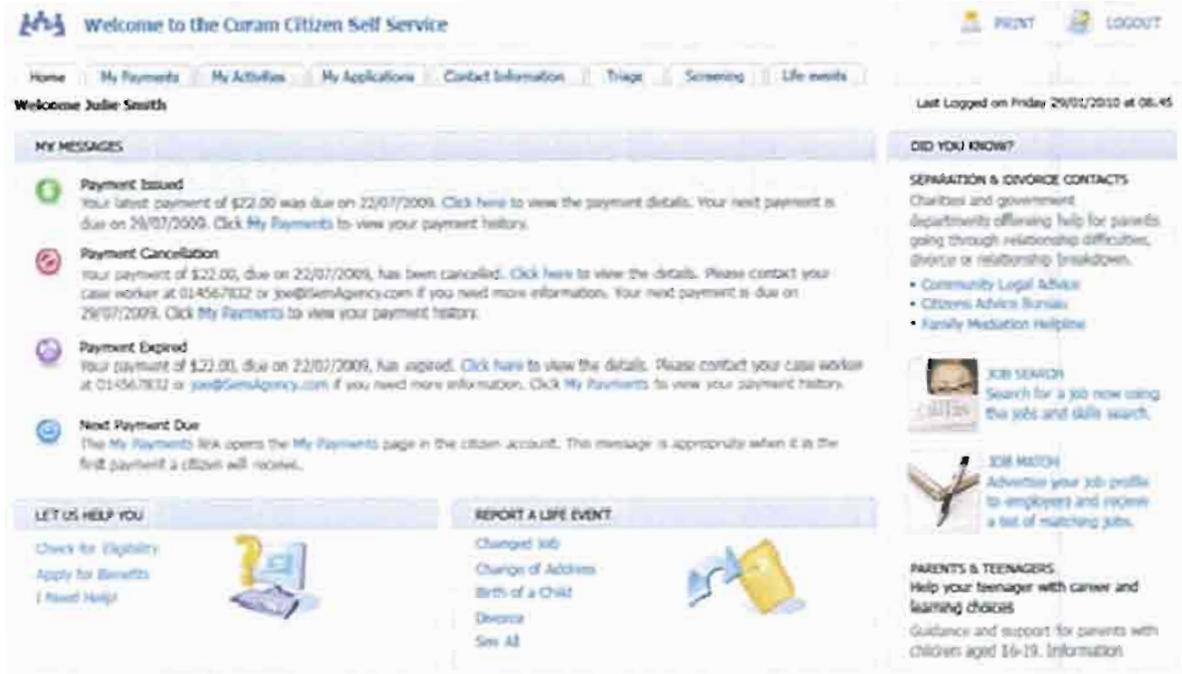

Figure IV-20: Example External Screen

IBM Curam allows for configuring targeted information or system-wide announcements for users.

Caseload Management

IBM Curam Case Management, the integrated case management component of the **SmartPro MedEE** solution, provides extensive functionality that will help public-facing staff to efficiently

manage increasing caseloads and administer programs that continue to increase in number and complexity. The Caseload Management functionality facilitates the creation, management and tracking of cases in support of MLTC's program and service delivery. In *SmartPro MedEE*, a case is used for recording and maintaining interactions between participants (such as clients, employers or providers) and the Department. The Case Management component controls the vast amount of data associated with cases and individuals while supporting caseload related tasks and activities. This feature also assists program administrators by tracking program access and usage by individuals and cases, monitor program statistics, and providing insight into program expenditures. <OPS019>

The “electronic case folder” facilitates centralized, client-centric case data management and tracks and manages the case lifecycle. Additionally, authorized staff have access to case and client information based on their designated role. <OPS004>

The proposed *SmartPro MedEE* case management functionality offers:

- A client-focused approach that provides case workers with a central, holistic view of client and case related information;
- An integrated case design that allows MLTC to manage multiple programs and services to a client or household through a single case, avoids duplication of data and promotes organizational efficiency;
- Integrated workflow processing that standardizes routine case processes, and increases the amount of time available to spend with clients;
- Intuitive case data that facilitates efficient recording and maintenance of key client data used to determine program eligibility and entitlement;
- Effective dated case data allows for “time slicing” that supports retrospective eligibility determinations and automated detection of overpayments or underpayments; and
- Automatic eligibility determination and entitlement calculation removes the burden of decision making from case workers and expedites accurate, consistent eligibility and entitlement decisions.

The privacy of personal and case information is essential and critical. All access to case and client information is based on the individual's role or association with the client and case. For example, log-on credentials designed to permit access to the system do not grant access to all system data. Access to case and individual data is permissible based on the user's role and affiliation to the case, restricting access to individual and case information. Additional restrictions can be set which will further limit access to sensitive information. For example, if a client is also a MLTC staff member the Department has the ability to set a high security indicator which will limit access to client details to a specified few. In these situations, search results will return a list of all individuals that meet the stated search criteria however, unless the user is specifically assigned or affiliated with that case as a worker or service provider they will not gain access to further details. Further, role-based security will restrict the access to individual and case information as well as the actions that user can perform on a case, i.e., view, modify, and perform merge functions. All transactions performed will be tracked and details maintained as part of the case transaction log. <APP029, ELG108, ELG163, OPS038, OPS052, OPS053>

Case Initiation

Cúram includes business services that are designed to streamline the process involved in creating and maintaining cases or electronic case files. A case may be created for a client or prospect client previously registered on the system. While *SmartPro MedEE* facilitates automated case creation, workers also have the ability to manually create cases and align individuals (registered or new) to that case in accordance with established program policies. Alternatively, client or client registration can occur at the time the case is created. Authorized users have the ability to associate clients and cases manually as required to support their workload. <ELG092, ELG093, ELG099>

During the creation of the case, the user selects the type of case involved, the expected outcome of the case, and other basic case-related information. The system will auto-generate and assign a unique case number when a case is created. This number will be used to track the case and as a reference for participants involved in the case. Figure IV-21: The Integrated Case Home Page reflects the assigned case number and serves as a launching point for authorized users to access additional case and individual details. Authorized workers can use existing case numbers to reopen or reactivate a case for the individual if all required information is provided, verifications are in place, and all other case aspects are in accordance with Department policy. By clicking on case or individual numbers reflected on any screen, authorized users can access details concerning the individual and or case. For example, authorized users can access demographic, income, resource and educational information concerning an individual as well as details such as income, resources or other factors used to determine individual and/or case eligibility. <ELG090, ELG091, ELG094, ELG095, ELG096, ELG162, ELG171, ELG172, OPS042>

Case assignment often occurs at this point in the process. *SmartPro MedEE* can be configured to automate the case assignment process based on the parameters established by the Department. For example, automated case assignment can be based on worker location or region, worker specialization, or in a predetermined worker sequence. This process can also be configured to assign cases to a specific work unit, or directly to the attention of a supervisor for manual case assignment. Supervisors or other authorized users have the ability to override an assignment at any time and reassign that case or group of cases. In most cases additional details such as date and reason for the override must be documented by the user to activate the override. All activities will be maintained on the case transaction log. <OPS005, OPS035, OPS043>

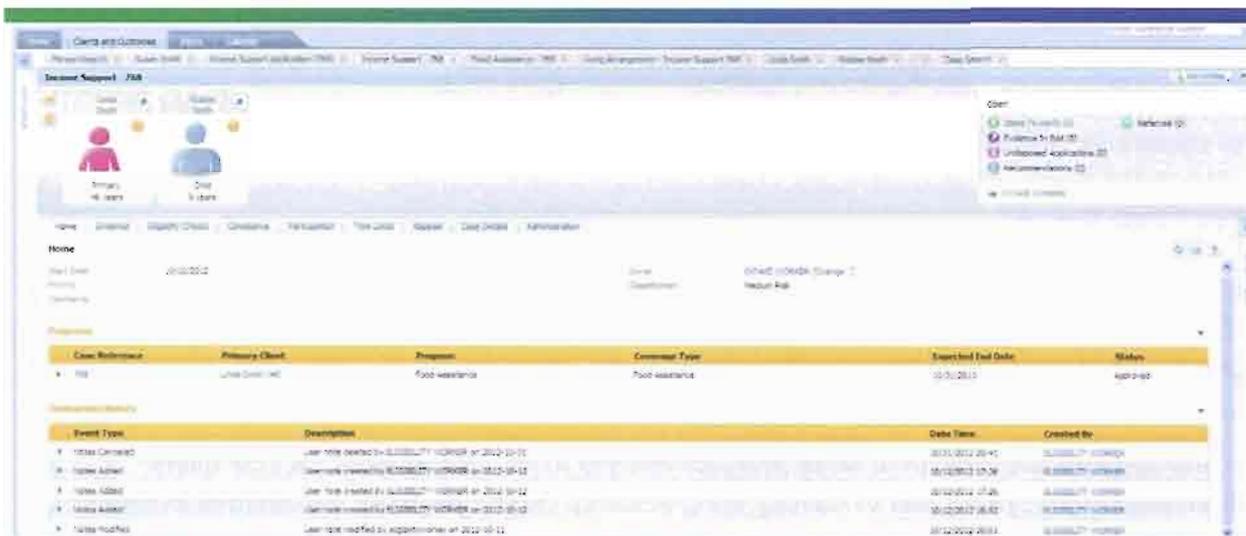

Figure IV-21: Integrated Case Home Page

Integrated cases facilitate the worker’s ability to access and manage clients and other individuals affiliated with a case, including employers, providers, and utilities. Case participants also include any nominees, contacts, and correspondents on the case. Authorized individuals, based on their role, can access case details, including eligibility results.

Case “members” are registered individuals added to an integrated case for the purpose of determining their personal eligibility for benefits and services; this information may also be factored into the eligibility determinations for an entire household or assistance group in accordance with program-specific policy. Each person who is part of the same household is assigned a case member role within an integrated case. As the worker builds the case he/she conducts searches on all individuals identified on the application or reported as additions to the existing case. If the system returns a match on an individual and the worker selects that individual, all available case and individual data will be brought forward for the worker to review and update as necessary. Relationships between all individuals linked to a case are recorded by the worker while building or maintaining the case. Member relationships are considered in eligibility determinations based on program rules. *SmartPro MedEE* will establish the reverse or complementary relationship once the initial relationship is documented. For example, if Susan is Jack’s mother the system will infer that Jack is Susan’s son. Specific pieces of client data are required at different process stages. All data entered and saved is maintained as part of the individual and case history. For example, shelter expenses recorded are date-specific as are used in accordance with policy when determining eligibility and entitlements for benefits and services. Authorized users can review details involved in these determinations as well as details surrounding case circumstances at any time. <ELG009, ELG164, ELG165, ELG172, GEN043, GEN086>

Specific pieces of client data are required at different process stages and based on the program. System administrators and other authorized staff will configure the solution indicating mandatory data elements based on program requirements. Although designated as mandatory it is possible that they are overlooked; as a result, onscreen edits will review data entered and prevent advancement to the next screen highlighting the missing data. *SmartPro MedEE* allows the user (client /authorized staff) to save and store information, and resume the task or activity at a later time. Authorized users

have the ability to review and update or edit data entered to date; they also have the ability to review a summary of this information – for example, review a complete application or reported change prior to submitting. <ELG042, ELG114, GEN069, OPS066>

Client and Case Search

Our proposed *SmartPro MedEE* solution's searching functionality allows users to quickly locate individuals and cases within the system. This functionality permits users to search for individuals and cases based on a range of criteria, such as client name, client reference number/ID, case status, aliases, and case reference number.

Cúram also supports the concept of saved searches referred to as “case queries”. A case query permits an authorized system user to identify specific search criteria based on information available; increasing the number of criteria often helps to narrow or focus search results. Search or query criteria can be saved and later used in the search as a personal query. This query can be run and rerun without the worker having to re-specify the criteria. It is important to note that Person search results are displayed in a summary list format from which users can navigate to the required participant home page using a hyperlink.

The Citizen Context Viewer (CCV) feature provides a complementary view of a person's details and their interactions with the Department. It consists of a pop-up window containing a dynamic folder structure that summarizes a person's details, their relationships and their involvement with the MLTC. A photo of the person may also be added, if available. Through the CCV, authorized staff can see which benefits and services the client receives, the cases with which the client is affiliated, and the level of contact the client has had with the Department.

The CCV also provides a holistic view of each of the client's family members. Users can view client information for each family member in the same CCV or launch a new CCV window for each family member. This can assist the MLTC in confirming whether a family member receives a particular benefit from any number of agencies, thereby reducing the risk of a family fraudulently collecting the same benefit. Figure IV-22: Citizen Context Viewer reflects a high-level view of the client's involvement with the Department with the ability to open folders and access additional details.

Figure IV-22: Citizen Context Viewer

The CCV window is launched from a person's home page and contains an expandable "tree" structure. The top of the CCV tree displays a picture of the client (if available) and associated personal details, namely, date of birth, gender, and address. Each CCV component groups related aspects of client information, including cases, client communities, family relationships, interactions, and multidisciplinary teams. Each of these components can be expanded by clicking the corresponding arrows. Each CCV component is configurable, which means that the precise information that is displayed when a given component is selected can be specified by an administrator. <ELG097, ELG098>

Case and Participant management within our proposed *SmartPro MedEE* solution includes duplicate identification and merging functionality to help decrease or prevent the incidence of fraud and errors resulting from duplicate client records. Cúram supports the merging of information from two or more records for a person or prospect person into a single, master record. Merging information essentially copies selected details from a record that is deemed a duplicate to the master record, which is then used as the valid record for case processing. The ability to merge client and/case information is role specific meaning that only individuals authorized to do so may perform that task. <GEN025, OPS038, OPS053>

The client registration, case initiation, and eligibility processes require verification of certain pieces of data based on the step in the process. These verifications may be received via interfaces such as verification of an SSN through the Social Security Administration or via email or other type of correspondence if the worker is verifying residence and living expenses. Data from reliable, designated sources will automatically update individual and case data. Some changes, a change in income or household composition, for example, automatically trigger an eligibility redetermination while others such as the addition of or change to a telephone number will not impact eligibility and therefore not trigger a redetermination. Additionally since data is used across programs the impact to different cases will vary. *SmartPro MedEE* will apply all changes in accordance with MLTC and program policy. All transactions will be logged allowing authorized users to determine the date, time, source and specific data updated via interfaces. The system can be configured to process specified transactions automatically (i.e., eligibility determination based on data received from a trusted source) or to notify the worker when any new information is received. It is possible to

configure a combination of the two options based on guidance and instruction received from the Department. All changes performed on a case are logged and maintained in the case history. <ELG002, ELG069, ELG070, ELG122, OPS054, OPS055>

It is possible that data received via an interface may not agree with reported or current case information. These discrepancies must be noted and acted upon. To address this possibility our proposed *SmartPro MedEE* solution through inherent IBM Cúram processes and edits, provides a capability for flagging discrepancies between data received by a client and the verification of this data received from a third party. Verifications received from third parties such as landlords will be reviewed and the case information updated. *SmartPro MedEE* can be configured to trigger notification to workers when multiple individuals are confirmed to reside at the same address. Such discrepancies are referred to as “issues”. An issue could be used to highlight, for example, instances where the reason given by a client for leaving a job is different to the reason provided by his or her employer. <GEN085>

Issue management capabilities provided within the proposed *SmartPro MedEE* will allow MLTC to:

- Automatically or manually create issues on a case
- View a snapshot of the evidence at the time the issue was created as well as the most recent evidence
- Track the progress of issues
- Prioritize issues
- Notify and assign appropriate users to issues
- Manage issue resolutions using built in workflows
- Appeal issue resolutions

Issues can be created on cases when issue information has been pre-configured and associated with evidence types and workflow events. Issue management allows the progress of the issue type to be tracked from issue creation, through entering a resolution for the issue, approving the resolution, and closing the issue. Issues can help organizations to detect errors and prevent fraud from occurring. This process can be used to notify specific departments, units and/or agencies if fraud is suspected. <ELG046>

Case Maintenance

Once a case has been created, authorized users may update case details and carry out maintenance tasks and activities as required over the lifetime of the case. Cúram provides comprehensive functionality to allow manual and automated processes for managing case details. The following table provides a listing of the information that can be captured and maintained using *SmartPro MedEE*:

Table IV-7: Case Maintenance Features

Feature	Functions
Case Participants	Case Participants are the various stakeholders involved in a case, for example the individuals, employers, providers and other contacts relating to a case. They are added by the system automatically by virtue of their role in relation to a case.

Feature	Functions
Attachments	Attachments are electronic documents that are linked to the case, associated with clients and communications on the case including, for example, scanned licenses or legal documentation.
Communications	Communications are the correspondence between the organization and participants on the case, including letters, emails and phone calls.
Events	Events are significant milestones and events relating to the case life cycle. Such events may be created automatically by the system as a result of some action that has been carried out on the case (e.g. case approved, case suspended, case closed, etc.) or they may be created directly by a system user (e.g. case reviews, referrals, and calendar activities).
Notes	Notes are used to provide additional information about a case and to help a user see the progress history for a case. Notes can be entered by any user that is authorized to maintain the case. They can also be created by the system as a result of specific events occurring on the case. The details of a note are entered by users in free text format. Notes may be assigned a sensitivity rating so that the note can only be accessed by certain users. All modifications to a note are maintained so that a history of the note details is preserved, including note version, the time and date the note was entered on the system, and the user who made the note modification.
Related Cases	Related cases are other cases in the system that have something in common with the case being viewed. Case relationships are automatically added by the system where appropriate and can also be manually created by a caseworker.
Tasks	In Cúram, a task is an instruction to carry out an item of work. Cúram Workflow tasks may be created automatically by the system or manually by a user. Tasks that are associated with a particular case are displayed in the Tasks list.
User Roles	These are users in the system who are assigned as either the case owner or case supervisor (or both). A single user may be assigned to both roles or different users may occupy each role.
Assessments	Assessments are simple rule-based determinations of specific characteristics relating to a client, for example medical assessments or at-risk assessments.
Contracts	A contract specifies a case member's responsibilities with respect to services or products received as part of the integrated case.
Products	Products are the programs that are being delivered as part of an integrated case.
Outcome Plans	Outcome plans are used to manage a client or household towards achieving specific goals, in order to improve their circumstances. They are created using the optional Cúram Outcome Management module.
Financials	The financials options display details of payments made, and bills charged in respect of product delivery cases.
Deductions	Deductions enable a portion of a benefit payment to be allocated towards a third party or a debt.
Evidence	Evidence data is used by Cúram to determine eligibility and entitlement for a case. This option enables a caseworker to capture and manage the personal and circumstantial data (evidence) relating to a client and their household.
Certifications	Certification ensures that only certified cases and certified periods are paid. Certifications are proposed periods of eligibility that are used to validate evidence. For example, if evidence is entered for a six month period but only three out of

Feature	Functions
	the six months are certified, the evidence entered for the remaining three months will not be validated until it is certified.
Appeals	Enables users to view details of any Appeals cases that have been created using the optional IBM Cúram Appeals module.

The case home page also contains options that allow users to modify summary case details and to carry out actions such as marking the case as an item of interest, and moving the case through the stages of the case life cycle. Users can also view a list of “recent transactions” on the case, a feature that provides a convenient audit trail of pertinent case events. The summary feature allows the worker or other authorized users to review available information and editing as required prior to completing the case initiation process or saving reported and verified changes. <ELG121, GEN079, OPS051, OPS052>

Case Life Cycle

Our proposed ***SmartPro MedEE*** solution will support the full case life cycle or series of steps and milestones achieved throughout the individual’s involvement with the Department and its affiliates. The case status may change depending on the actions carried out on the case and the workflow processes that have been defined for the particular case type. Process and associated workflows will vary in complexity based on the task undertaken; ***SmartPro MedEE*** will track these processes and update case status based on milestones defined by the Department. MLTC will have the option to implement out-of-the-box workflows or to configure department-specific processes and workflows allowing specific life cycles and workflows associated with specific case/program types. <ELG169>

Application

The ***SmartPro MedEE*** solution will support the intake of applications through a variety of venues. The Public Self-Service portal provides the opportunity for individuals to research benefit and service options available through the MLTC and independently initiate an application for those services. Individuals can also submit paper applications at the local office or submit those applications through the mail or by fax. In all cases, ***SmartPro MedEE*** will guide the user through the application process by presenting views in a logical sequence designed to intelligently collect all mandatory and other data based on responses entered. The application process is used not only as a means to request the benefits, services or initiate subsidized insurance application requests but also to gather individual and household data concerning income, employers, resources, address, living expenses and health insurance and policy-specific details. This information is maintained throughout the life of the case and the individual’s involvement with the Department. On-screen edits are designed to scan entered data to confirm that all mandatory data is entered, prohibiting advancement to subsequent screens until this is completed. Applicant or authorized representative signatures on the application, regardless of the mode in which the application was submitted, will begin the application process. <ELG067, GEN026, OPS066>

To determine eligibility for Medicaid, state-funded and administered Medical Assistance and Insurance coverage offered through an Exchange detailed information must be collected for each

individual in the household. Demographic details such as name, DOB, SSN, employment and wages, school attendance, and alternate or additional insurance must be captured and verified. Additionally, each individual's relationship to other members of the household is used to establish the composition of assistance groups, establishing cases, and to determine eligibility for benefits and services. Relationships are maintained throughout the individual's involvement with the Department with a history of relationships and case affiliations tracked. It is possible for an individual to be a member of multiple cases however; the system is designed to avoid duplication of benefits. For instance, a client will not be eligible to receive Medicaid benefits from multiple cases. They may, however, be a recipient in one case and the head of household in another. *SmartPro MedEE* will also establish the relationships or affiliation of cases to each other. The Client Context Viewer provides authorized users with insight into and access to the cases with which a client is associated.

<ELG165, GEN043>

The user (client or MLTC staff) will have the ability to review and confirm all entered data prior to signing and filing the application. Any and all data entered and saved by the applicant during a screening to check for possible eligibility will be carried over, populating the formal application. The system will process information available in order to determine if the case meets the Department's definition of an expedited benefit case. If so, the system will set a flag and notify the worker of the need to process this case within the compressed timeframes specified by policy. This notification will appear on the worker's home page indicating a newly assigned case and will also be queued in the worker's workload listing indicating processing timeframes. The system will track critical dates and specified milestones alerting the worker as deadlines approach. Failure on the worker's part to complete tasks as scheduled are automatically escalated to the attention of a supervisor. <ELG024, ELG026, ELG167, GEN081>

The integrated case facilitates the collection of client and household-specific data and access to that data for those authorized to do so. This collection of data will also be populated with data received from external systems interfaced with the *SmartPro MedEE* solution. Such interfaces can include workforce management systems, tax property tax records, city and county benefit systems, car registration systems and other benefit systems. <GEN018>

Eligibility

Before the case transitions from the intake or application phase to the point where eligibility will be processed several steps must be completed. In many instances the worker must interview the client and or client representative. In these cases an appointment will be scheduled to review information provided on the application. The system will generate notification to the client or authorized representative providing details of the scheduled interview. This appointment will also be tracked in order to provide the worker and the client/applicant information concerning interviews that did not occur and the consequences of the missed appointment. During the interview, the worker will discuss the available program options and provide the applicant, or in the case of a redetermination the client, with a full understanding of the expectations or responsibilities that comes from accepting benefits. The date of the interview is recorded by the worker. <ELG134, ELG168, ELG169>

Once all data required to perform an eligibility determination for all programs involved is recorded, that information must be verified. The system will produce a list of required verifications and the

date those verifications must be provided; this will be delivered to the client /authorized representative using their documented preferred method of communication. The system will track verifications received, and the source of those verifications. Enhancements to the base solution will be necessary in order to compile and produce client notification of verifications received. At both initial application and redetermination verification may be obtained directly from a third party such as a landlord, directly from the client such as paystubs or via interface from an MLTC designated trusted source. Verifications received from the client and or third party may be scanned and attached to the case. These will remain as case artifacts that are accessible to authorized users as needed. Verifications received via an interface such as verification of a SSN or SSA benefits will automatically update the case unless there is a discrepancy. The system can be configured to notify the worker should a discrepancy occur. Clients having issues obtaining verifications can contact the worker through the Public Self Service portal or other means of communication. Authorized workers have the ability to extend the time needed to obtain the verification. The reason and approval should be documented in the case notes. <ELG002, ELG120>

Once verifications are available and recorded, *SmartPro MedEE* will automatically assess case circumstances and determine or re-determine eligibility. Individuals with existing cases currently in closed status will, if eligible, receive a notification of the reopening of the case indicating the benefits to which they are entitled. Reopens can occur in situations where the person's benefits were suspended or the case was closed for a period of time allowing reuse of the case number. This will be done in accordance with Departmental policy and procedures. Authorized workers can use existing case numbers to reopen or reactivate a case for the individual if all required information is provided, verifications in place and all other case aspects are in accordance with MLTC policy. Reopen transactions will require the worker to indicate the reason for reopening. <ELG163>

Case events, changes in circumstance, and client actions may result in case closings. In some situations automated eligibility redeterminations will result in closing, in other cases this action may require worker intervention. Cases may be closed at any time by an authorized user, for example if a case was opened in error. Typically, a case is closed after a number of intermediate steps, at the end of which some outcome is achieved in respect of the case, for example, receipt of appeals results, benefit suspension or client request to close a case. <ELG102>

Situations may arise that require the override of a system generated decision or result. An override feature will allow authorized workers and supervisors to initiate and complete the override process. In all cases, an override reason deemed acceptable for the action must be selected and a date specified. This action will automatically trigger an eligibility redetermination, reset case and individual status, and generate the appropriate client and worker notifications. This feature will include the ability for authorized users to override auto generated special situation indicators when those indicators are established by the Department. All override transactions will be noted in the transaction log. <ELG101, ELG110, ELG152, OPS059>

As clients move or transition to other cases, caseloads require coverage, or caseload balancing is necessary to ensure that clients receive the best possible service, cases may be reassigned. Authorized users can reassign single or multiple cases in a single action. When this action is completed the system will perform several actions:

- Inform the newly assigned worker via alerts and tasks on their home page;
- Transfer all alerts, appointment and case obligations with the case to keep the newly assigned worker informed; <OPS032>
- Generate a notice to the client and authorized representatives informing them of the change; and
- Record the transaction details on the case log.

SmartPro MedEE will monitor worker caseloads. The Department-approved maximum number of cases assigned to a worker can be modified (i.e., increased or decreased as necessary) by authorized staff through the administration application. Caseloads can be assigned to users, teams, or work queues and the management of these entities will dictate the number of available caseloads. <OPS041>

Rules

In Cúram, data and rules are used to establish the composition of an assistance group and reach a decision regarding a person's or household's eligibility for a program or service. Data reflecting the client's and household's circumstances is assessed to determine program eligibility. Rules are conditions of entitlement derived from legislation or the Departmental policy. A person's data must satisfy the rules specified for a program in order to qualify for that program.

The rules will determine the assistance group composition based on individual and case circumstances and will assign individuals to cases based on these conditions. For example, a family may include a child or children eligible for CHIP and other family members eligible for Medicaid or other insurance offered by the Exchange. *SmartPro MedEE* will assign case numbers to each 'type' of case while maintaining the connection or relationship of family member cases to each other. This established case relationship allows the worker to see all the benefits or services received by a client and the household. Automated eligibility in combination with visibility into all benefits and services received will help to identify potential duplication of benefits or services. Upon review of the automated case structure, the worker has the ability to manually adjust as needed. The system will redetermine eligibility based on all case structures and all changes made to determine the most advantageous set or level of benefits for each individual. <ELG097, ELG098, ELG103, ELG104, GEN084>

When eligibility is checked, rules are run against the data to determine eligibility and generate case decisions. These decisions specify whether or not the person is eligible and, if eligible, the level of entitlement. Rules are assigned to assessment and product delivery case types through the Cúram administration application.

The Eligibility section describes the full eligibility functionality that will be available through the implementation of our proposed solution.

SmartPro MedEE will provide users with an intuitive interface for managing data which can be recorded initially in an "in-edit" stage, pending verification or approval by an authorized worker or member of the supervisory staff based on the criteria established by the Department. The system's data management capabilities will help maintain the accuracy and currency of client information

within the system, ensuring that clients receive the correct services or entitlements over the time period for which they are deemed to be eligible.

Client personal and circumstantial data maintained at the integrated case level may be shared across cases encapsulated within the integrated case; it may also be shared with designated external systems as determined appropriate by the Department. For example, when a person applies for multiple programs, each program may treat living arrangement and expense information differently. While the information is entered and verified once, it will be used differently when applied against different program eligibility rules. Sharing with an external system such as FAMIS will help to guarantee that all agencies are using the same data to the benefit of the client and hopefully work towards decreasing the incidence of fraud. The system, based on specific program rules will determine how data is used and applied to eligibility determinations and benefit calculation. <ELG068, OPS055, OPS063>

Rules Processing

Cúram provides a rules infrastructure, known as Cúram Express Rules (CER) that includes a CER Editor and CER Engine, to manage the rule-based processing within the system. The CER Editor is provided within the Cúram administration application and empowers organizations to manage individual rules and rules sets, to allocate the rules to the programs administered by the organization, and to establish rules associated with new programs as dictated by legislation and the benefits and services offered by MLTC. <GEN067>

In the deployed system, the CER Engine executes the rules defined for each program to determine eligibility and calculate entitlement based on the evidence data captured for a client or a household. CER has been designed specifically to efficiently handle the large amounts of rules often associated with program delivery. CER is also used to address changes in legislation including mandates addressing new programs or coverage types. Through CER rules for new programs are developed empowering the the Department to configure, test and implement new programs quickly. This feature is discussed in greater detail in the Non-Functional section of this response. It is also critical for the Department to track expenditures at the program, case and individual levels. *SmartPro MedEE* can be configured to associate benefits and services to specific funding sources. This feature will allow the Department to gauge program expenditures to determine the availability of that program or service in the future and, if necessary can be used to create and maintain waiting lists which will allow clients be approved for services on a first come first served basis should the funding source be replenished.

All rules are date-specific which supports eligibility processing that spans periods. For example, if a client applies for retro-active medical assistance or, if a verified change in circumstance impacts eligibility for a prior period, case and individual verified data applicable to the prior period are applied against rules in effect for that prior period; that data is also applied against current rules to determine eligibility for the current period. If a payment or benefit discrepancy is noted by the system for any prior period the *SmartPro MedEE* will determine the difference between that received vs. that which was truly due notifying the worker of the discrepancy. Recoupment or repayment activities can be automated and tracked as well.

Case Decisions and Reassessment

Periodic reassessment of client eligibility must be completed in accordance with policy. This may occur at predetermined intervals and/or at the time a change in client or household circumstances is reported and verified. **SmartPro MedEE** will monitor all factions of client eligibility including reassessment timeframes. The worker will be notified at predetermined intervals indicating the need to reassess the each case.

SmartPro MedEE case management functionality allows authorized users and system processes to access the decisions that have been made in relation to client eligibility over the life of the case. Decision information indicates whether a person is eligible or ineligible for a given program or service. Each eligibility decision contains details about the rules and the financial and/or non-financial results generated when eligibility is checked. **SmartPro MedEE** automatically generates notifications to clients and/or authorized representatives detailing the eligibility determination results. These notifications are also maintained as part of the case file. <ELG066, ELG070, ELG156>

To allow for retrospective assessment of cases, or “case reassessment”, **SmartPro MedEE** will store a comprehensive history of the details surrounding all client eligibility determinations. Case reassessment occurs when there is a change in circumstance and a new determination and decisions are created and stored. To perform case reassessment, Cúram incorporates a robust Eligibility and Entitlement Engine that uses Cúram Express Rules (CER) to continuously reassess a client’s or household’s eligibility for one or more programs as well as the recalculation of any benefit entitlements.

A reassessment/redetermination occurs whenever pertinent data/evidence is changed, regardless of whether the change is made by a user, through information received from an external system, or as the result of an administrative system wide change such as a change to a rate table or rule set. Additionally, the Eligibility and Entitlement Engine automatically compares new financial components with processed financial components to determine if any underpayments or overpayments exist. If applicable, the system checks for instances of overbilling or underbilling. If an under/overpayment exists (or under/overbilling has occurred), the Eligibility and Entitlement Engine calculates the amount involved and carries out the appropriate actions to rectify the situation, for example creation of an overpayment case or generation of a notification to a caseworker or other authorized system user.

Situations arise requiring that a rule or condition be applied across the entire caseload or a segment or specified population within the MLTC caseload. These mass changes may occur at predetermined intervals, such as the annual SSA Cost of Living Allowance (COLA) or as the direct result of a change in legislation that results in a change in program rules. Rules can be configured to address these changes, scheduled to occur on a specific date, and run on that date. The execution of the new rule will impact cases and benefits to reflect the new policy. **SmartPro MedEE** will generate notices to clients and authorized representatives in accordance with MLTC policy. In addition to the client case history updates, the transaction log will reflect the mass change transaction. <ELG166>

Rules and Rules processing are described in greater detail in the Non-Functional section of this response.

Managing Cases with Appeals

A significant benefit of the integrated case feature is the authorized user's ability to access and oversee all aspects of the case including cases in which decisions are currently under appeal. Actions by assigned workers may impact an appeal. An appeal can be initiated by the client, authorized representative or by the assigned worker on the client's behalf. When initiating an appeal the client must indicate whether or not they choose to continue benefits at the level prior to a decision to terminate or decrease the benefit(s). Additionally workers may be authorized to document updates such as to reinstate benefits and/or services at the pre-negative action level if requested in accordance with MLTC policy, or to enter notes that impact the appeals case based on the protocol established by the Department. As with all other activity, all transactions, including notes that are conducted on the Appeals case are based on the permissions granted to the user and transaction details are logged and maintained as part of the case file. <APP025, APP033, APP042>

Case Notes

SmartPro MedEE notes feature allows authorized users involved with the client to document activities and issues that occur throughout the life of the case, further explaining reasons for decisions and recording the results of conversations with or on behalf of the client. Notes are entered as free form text and editable by the author until such time as the note is saved. Workers or those entering notes have the ability to perform a spell check prior to saving the note. Additional notes may be added to clarify or expand upon a prior note but once saved the note cannot be modified.

SmartPro MedEE will automatically date and time stamp notes as they are saved, preserving the note in its entirety and allowing those with access to search and review those notes. The ability to print case notes will require modification of the base solution. The worker also has the option of using the copy and paste feature if they choose to enter the note as a specific client and/or multiple case entries. <APP017, ELG055, ELG115, GEN027, GEN029, GEN030, GEN031, GEN032, GEN033, GEN035>

The worker also has the option of using the copy and paste feature if they choose to enter the note as specific client and or multiple case entries. <GEN031>

Notes can also be pre-populated and auto-created. Workflow logic can be used to determine when to auto-populate the note and indicate what text should be included. The use of templates will require modification of the base system being proposed, however. <ELG044, GEN028, GEN029>

Documentation/Correspondence/Client Notification

Authorized users can perform various actions throughout the life of the case. ***SmartPro MedEE*** through its monitoring capabilities alerts workers of case events to prompt action and keep them abreast of case progress, activities and obligations they may have in relation to the case. Similarly, case participants, such as the clients, employers or providers will be notified of case related obligations or events via email or through correspondence notices created automatically by the system.

The integrated correspondence feature notifies workers, members and stakeholders via a personalized message on their account page and/or other preferred method of communication, including mail. Notification text is set by the Department and most often communicates details concerning eligibility decisions and changes, upcoming certifications or renewal periods, recent payments or billings, changes in case or appeal status, or outreach information. These notifications often communicate what action(s) the client may or must take and the associated timeframes or due dates. Processing timeframes are configurable and trigger different workflows including notifications, alerts, and possibly even case actions (such as application denial or case closure).

Clients and authorized representatives may view notification messages from an Inbox associated with their secure account. This functionality is available to all external users of *SmartPro MedEE*. When new Inbox content is generated, a notification email is sent to the member's online account. In order to adhere to security and privacy requirements, communication details are not sent directly as attachments or as email content. Instead, the member is directed to access their online account to view their communications in a secure manner. Members also view uploaded verification documentation and communications through their online account. If correspondence or notices are directly sent or copied to a third party such as an authorized representative, it appears in the user's online account Inbox. <ELG011, OPS014, OPS015, OPS016>

Supervisory

The Cúram Supervisor Workspace offers a wide range of work management capabilities across the Department and provides several views into the MLTC workload, at the team, department or divisional level. The Supervisor Workspace allows managers to make better decisions and meet their goals through:

- Supervisor dashboard views of staff assignments
- Real-time display and access to information
- Centralized management of cases and tasks
- Prioritization, balancing and allocation of workloads
- Management of work processes across multiple levels of organization.

<OPS043>

By providing managers/supervisors with insight into their organization's workloads and the ability to make decisions in real time, Cúram Supervisor Workspace will assist the Department in advancing toward their operational goals. The *SmartPro MedEE* will provide program administrators and other authorized users with information concerning MLTC operations. The ability to access information on pending cases may prove to be beneficial when assigning or reassigning cases or attempting to determine issues with specific steps in the process. For example, the authorized user has the ability to query pending cases to determine the reason the case is pending beyond program stipulated processing timeframes. <ELG047>

Key Features

Cúram Supervisor Workspace presents supervisors and managers with work load information in four distinctive dashboard views: by user, by case, by work queue, and by organization unit. The

four presentation options provide decision makers with detailed information about staff assignments allowing them to quickly make informed decisions concerning changes that will impact operations and a worker's ability to quickly and efficiently tend to their clients. Additionally, each workspace provides the managers with context-sensitive views and tools to manage work. <OPS022>

On log-in, the supervisor is presented with the Supervisor Workspace home page which makes a number of alternative workspaces accessible including the following:

- A list of users who report to the supervisor;
- A list of cases that are owned by the users who report to the supervisor;
- A list of the organization units in which the supervisor holds a lead position; and
- A list of the work queues to which the supervisor's users are subscribed.

The purpose of each of these lists is to provide overview information and a link to each of the individual workspaces. The supervisor's calendar and shortcuts are also displayed. A sample Supervisor Workspace home page is shown in Figure IV-23: Supervisor Workspace Home Page

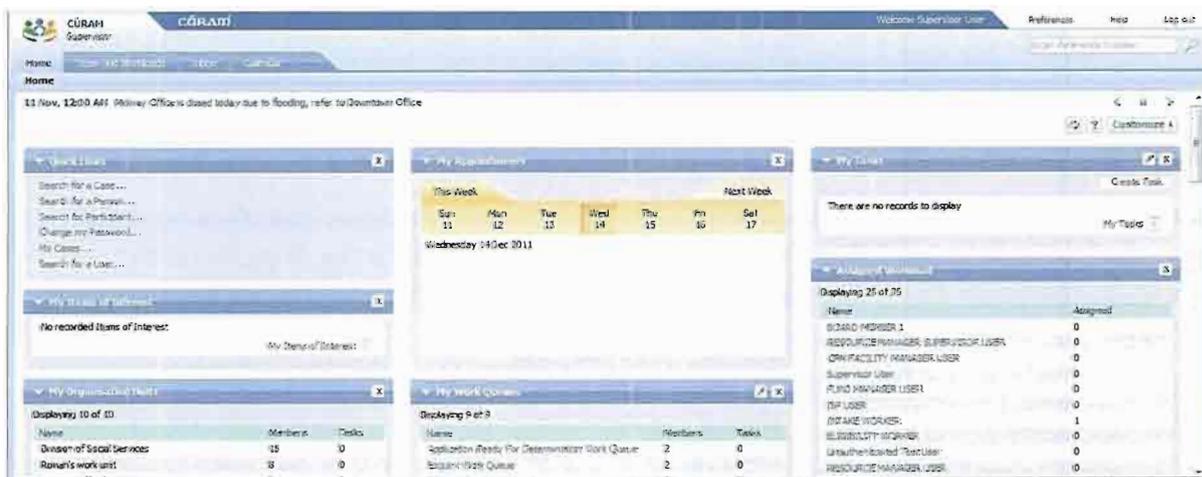

Figure IV-23: Supervisor Workspace Home Page

User Workspace

The User Workspace allows supervisors to readily view assignments, availability and workload for each staff member. Supervisors and managers can redirect tasks to other members of the team, or to other work queues; assignments can be viewed according to type and status of work. These capabilities provide the ability to quickly evaluate workloads and determine the best plan for completion. <OPS040>

Task graphs are used to provide an at-a-glance overview of a subordinate user's tasks. The work queues that a user is subscribed to are also displayed. The application allows a supervisor to reserve single or multiple tasks for a user. Task redirection can be used to redirect tasks to another user that the supervisor chooses. An allocation block can be created that will prevent a task from being assigned to a user. <GEN073>

The User Workspace also allows supervisors to view the user's calendar, and user calendars can be administered and maintained at the local level. Finally, the User Workspace provides access to user

settings that can be adjusted to reflect the changing skills, working patterns, and responsibilities of the user. <OPS023>

A sample User Workspace home page is shown in Figure IV-24: Sample User Workspace.

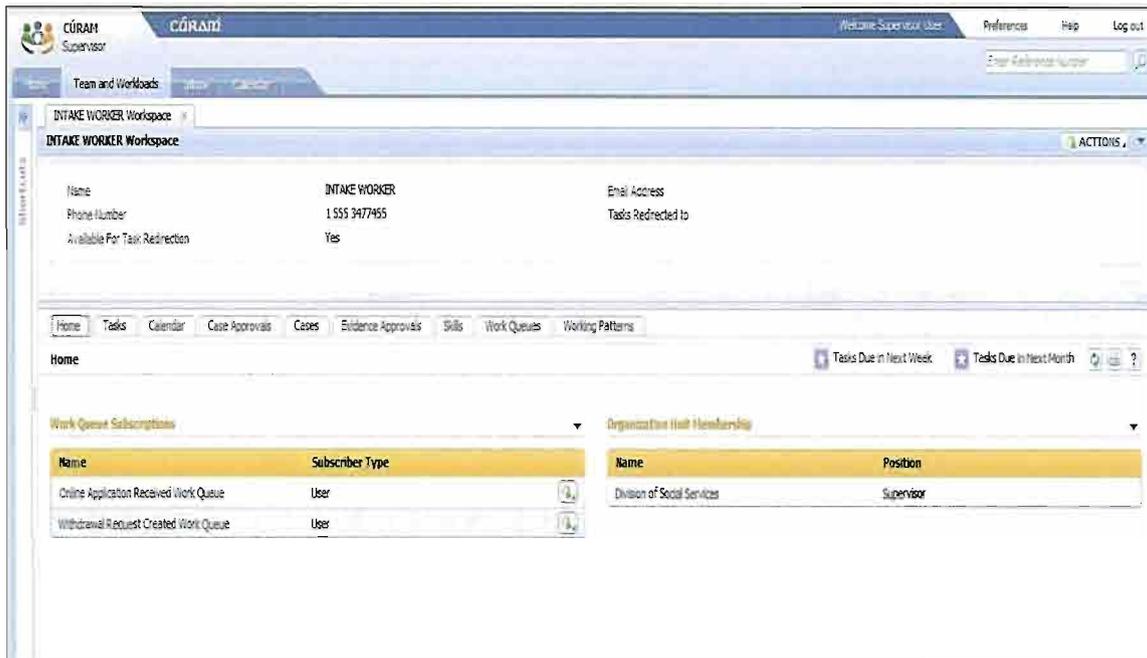

Figure IV-24: Sample User Workspace

Case Workspace

The Cúram Supervisor Workspace provides a case filter that allows supervisors to focus on particular groups of cases. From such a filtered list, cases can be viewed using the Case Workspace. The Case Workspace allows the supervisor to quickly view current and upcoming activities for each case and create work strategies based on case types and statuses which help meet the organization's overall goals to improve overall outcomes for its clients.

From the Case Workspace, the supervisor can manage and distribute the workload of a case, or reassign the case to a new owner. This can be done manually by selecting a new user, or by choosing automatic case reassignment. The case transfer workflow will be configured to trigger a supervisory case evaluation or review prior to transfer allowing the supervisor to confirm that established transfer criteria are met. As the transfer is complete, system generated notifications will be delivered to the Single Point of Contact, or designated universal assignee such as a work group, as well as the client. Finally, a case user schedule allows the supervisor to view activities for users with a role on the case. <OPS031, OPS034, OPS036, OPS037, OPS043>

A sample Case Workspace home page is shown in Figure IV-25: Sample Case Workspace.

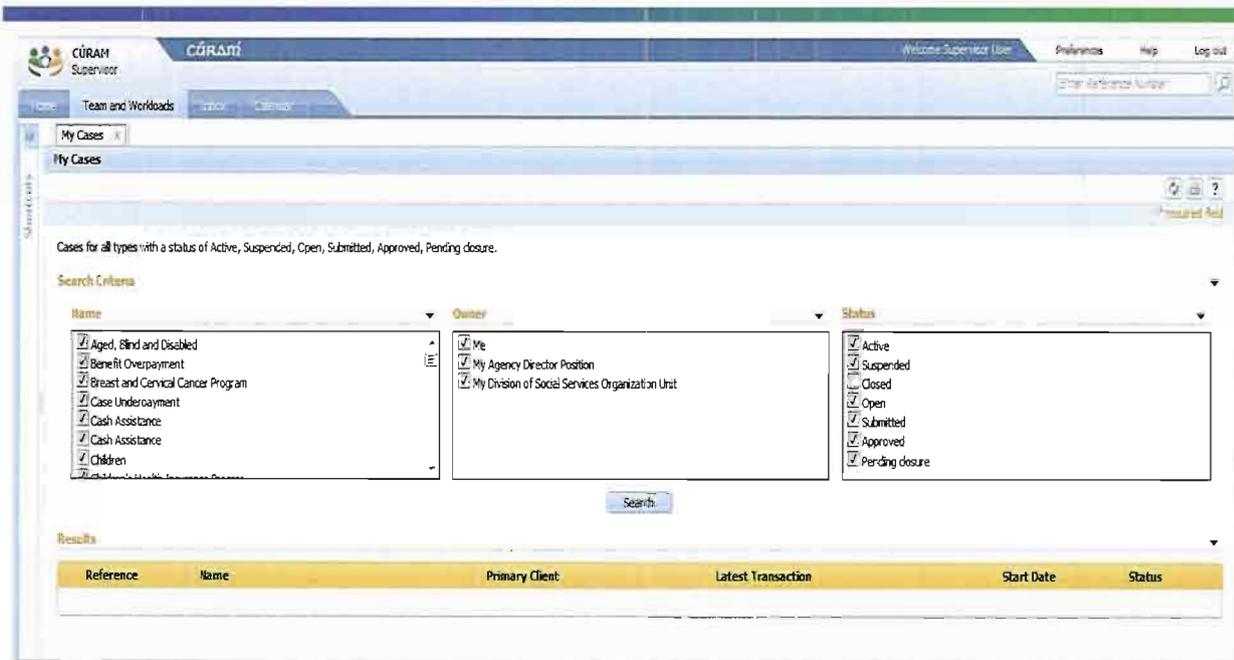

Figure IV-25: Sample Case Workspace

Organization Unit Workspace

The Organization Unit Workspace presents supervisors and managers with an aggregate view of their organization's workload. It gives managers the ability to analyze and compare workloads of teams and departments within the organization and shift work as needed in support of organization goals. As shown in Figure IV-26: Sample Organization Unit Workspace provides supervisors the ability to drill down into the details for each organization unit listed.

Figure IV-26: Sample Organization Unit Workspace

Selecting a unit on the list provides the supervisor with the key details of the unit and a list of the members, their positions, and their contact details. Managing work for an organization unit is

achieved through managing work for the unit members. Supervisors can monitor tasks assigned to an organization unit, and reserve tasks to users that he or she manages. The supervisor assesses the work assigned to the organization unit, and directs the work to the individual best equipped to complete the work. A group schedule for the users in an organization unit is available to the supervisor, providing an overview of the users' activities for the week.

A sample unit workspace home page is shown in Figure IV-27 Sample Unit Workspace.

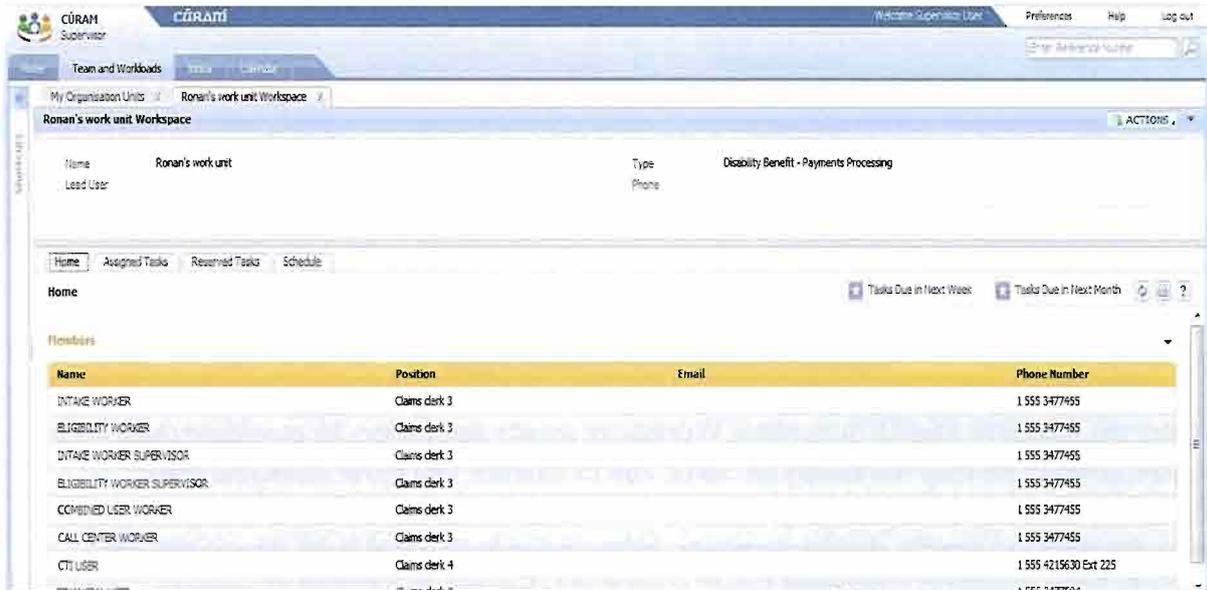

Figure IV-27: Sample Unit Workspace

Work Queue Workspace

The Work Queue Workspace provides supervisors with the ability to more effectively meet Departmental defined service levels by giving managers tools to monitor and manage work flowing through their designated work queues.

The Work Queue Workspace contains key details about a work queue, including the owner of the work queue, and the sensitivity level set for the work queue. The Work Queue Workspace also indicates whether users can subscribe themselves to that work queue. To view the Work Queue Workspace, the supervisor's account must have at least the same sensitivity level as that set for the work queue. The sensitivity level and the ownership of a work queue are set at the administration level, as is the supervisor's sensitivity level. The management of work for a work queue involves the reservation of tasks assigned to the work queue to users subscribed to that work queue. <OPS022>

A sample Work Queue Workspace is shown in Figure IV-28.

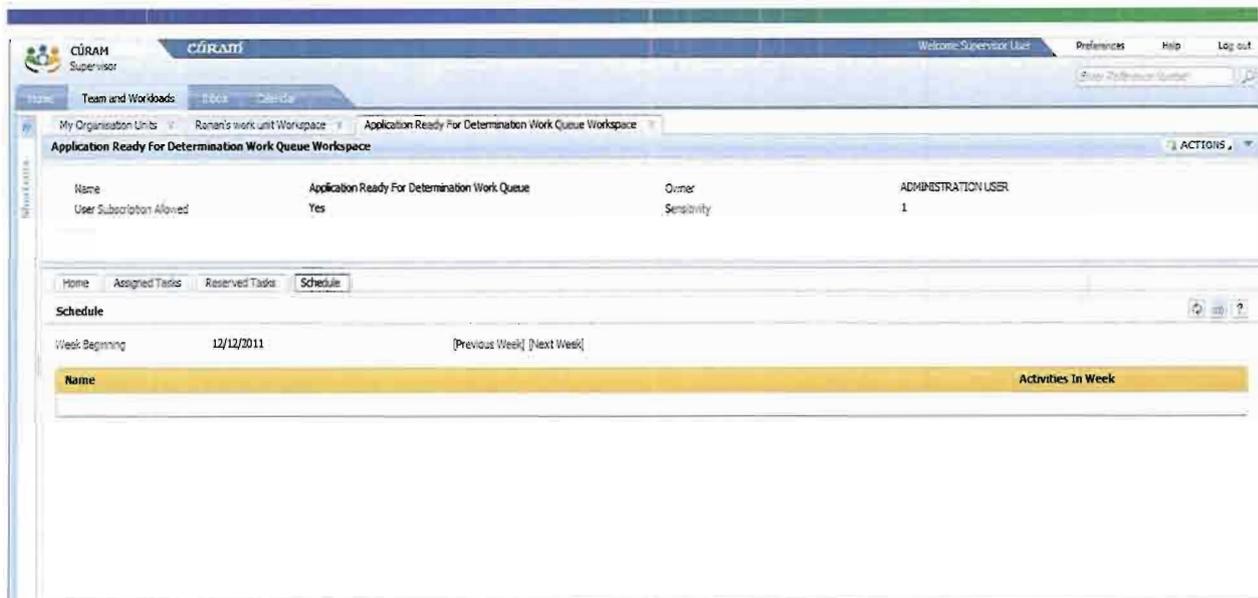

Figure IV-28 Sample Work Queue Workspace

In Summary the *SmartPro MedEE* Supervisor Workspace assists supervisors by providing them with the tools to efficiently balance workloads for users, and to monitor and move cases and tasks through their life cycles. It delivers multiple views into the organization's workload and gives supervisors the ability to rapidly shift assignments, either individually or in bulk. As a result, the supervisor can react quickly to unexpected staff or caseload changes. In addition to manual balancing of workloads by Supervisors, algorithms can be defined to automatically assess workloads and reassign cases to balance workloads. Such algorithms will utilize organization and location hierarchical structures to propose recommended workload distributions. <OPS024, OPS025, OPS026>

Most importantly, Cúram Supervisor Workspace supplies the organization with real time views into each staff member's work and caseload. At a glance, managers know the throughput of work queues and are equipped with tools to direct work load corrections as needed.

NOT029

Clients need the ability to request reconsideration and to appeal any decision issued with regard to their benefits or the benefits of any member of their household. These requests are based on the information detailed on the client's notices or correspondence concerning their eligibility determinations. The Wipro/IBM team's proposed *SmartPro MedEE* solution incorporates IBM Cúram Appeals which will facilitate the Department's management, administration, and resolution of appeals. It provides comprehensive support to the intake, hearing, and decision processes, including work allocation and work scheduling, notice generation, data or evidence collection and management, and reporting capabilities.

IBM Cúram Appeals operates seamlessly with many other components of the *SmartPro MedEE* solution including case management, participant management, workflow, correspondence, and calendaring, all of which support generic processes and the legal actions requirements associated with appeals and stipulated in the RFP.

The integrated IBM Cúram Appeals component:

- Provides pre-built business processes for handling appeals and legal actions processes.
- Offers flexibility to empower agencies similar to the Nebraska MLTC, to configure their system based on their appeal process and levels of appeal.
- Facilitates efficient routing of information and work to MLTC staff involved in appeals and legal actions processes through its workflow capabilities.
- Automates communications keeping those involved with an appeal informed of the progress of the appeal or legal action.

The *SmartPro MedEE* Appeals functionality is designed to allow the State of Nebraska, MLTC to establish an integrated, custom appeals process for the programs that it administers. Both the number of appeal levels and the type of appeal that can be created at each level are configurable on a program-by-program and issue-by-issue basis. For example, a Request for Consideration may be inserted, as applicable, in each step of the process as determined by the Department. By doing so, all activities associated with Reconsideration and all other steps or phases of the Appeals process are fully documented and maintained within the Appeals case. <GEN057>

The solution's Public Self-Service feature provides clients and their representatives the ability to independently initiate reconsiderations and appeals, update information concerning those appeals, and access the status of an appeal at any stage of the process. It also affords these individuals the ability to request proceeding postponements, communicate with the Department to register concerns, or dispute decisions made throughout the Appeals and Reconsideration processes. Role-based and user-based security confirms secure access to Appeals and case data based on the rights granted each user type. Our proposed *SmartPro MedEE* solution offers clients and their representatives several options when initiating an Appeal including direct contact with the case worker, as well as submission via email, or by way of a direct verbal request to the Department. To conform to Departmental policy and processes, verbal requests for an Appeal or Reconsideration must be followed up by a written request for the appeal to be registered and the process to begin. The system can be configured to confirm that a written request is filed when initial Appeal or Reconsideration requests are documented as a verbal request. Reconsideration and Appeal requests initiated through direct agency contact and not through the use of the Public Self-Service option will require direct input by designated Department staff. Whether client initiated through the Public Self-

Service portal or input by MLTC personnel, the system will guide the user through the data entry and overall Appeals process. <APP007, APP033, APP034, APP035, APP036, APP037, APP040>

Appeals Management

Upon receiving a request for an appeal, an appeal case is registered and is automatically linked to the case being appealed (also known as a lead case). Three appeal case types can be created out-of-the-box, namely:

1. Hearing Case
2. Hearing Review
3. Judicial Review

Additional levels such as Reconsideration may be defined to support the unique business requirements of the State.

Hearings

Hearings provide appellants with the opportunity to challenge a decision made by the Department, and to present their own evidence and arguments. For example, individuals may exercise their rights to appeal eligibility determination decisions concerning Medicaid, premium tax credits, cost sharing subsidies, QHP eligibility or eligibility determinations for any/all programs and services as determined by the *SmartPro MedEE* solution. *SmartPro MedEE* will support oral and desk-based hearings. <APP048>

Once the appellant and respondent have been identified, the user may proceed with the creation of the hearing case. This involves entering the key data regarding the appealed decision, including the reason for the appeal and whether or not benefits for the appellant should continue. Authorized MLTC staff have the ability to reinstate benefits for benefit termination or to continue benefits at their present level should the client indicate this decision on their appeal request. The system will maintain an accurate, complete history of benefits received in order to initiate the recovery process should the Appeal results uphold the original decision to reduce or end eligibility for benefits. <APP032>

An example of an IBM Cúram Appeals hearing case home page is displayed in Figure IV-29. Authorized users, including the client, have the ability to navigate through the case using the tab navigation feature. They can also drill down to case/appeal specific data by clicking on links provided. The ability to view and access data is based on the user's log-on credentials in combination with their role in the case.

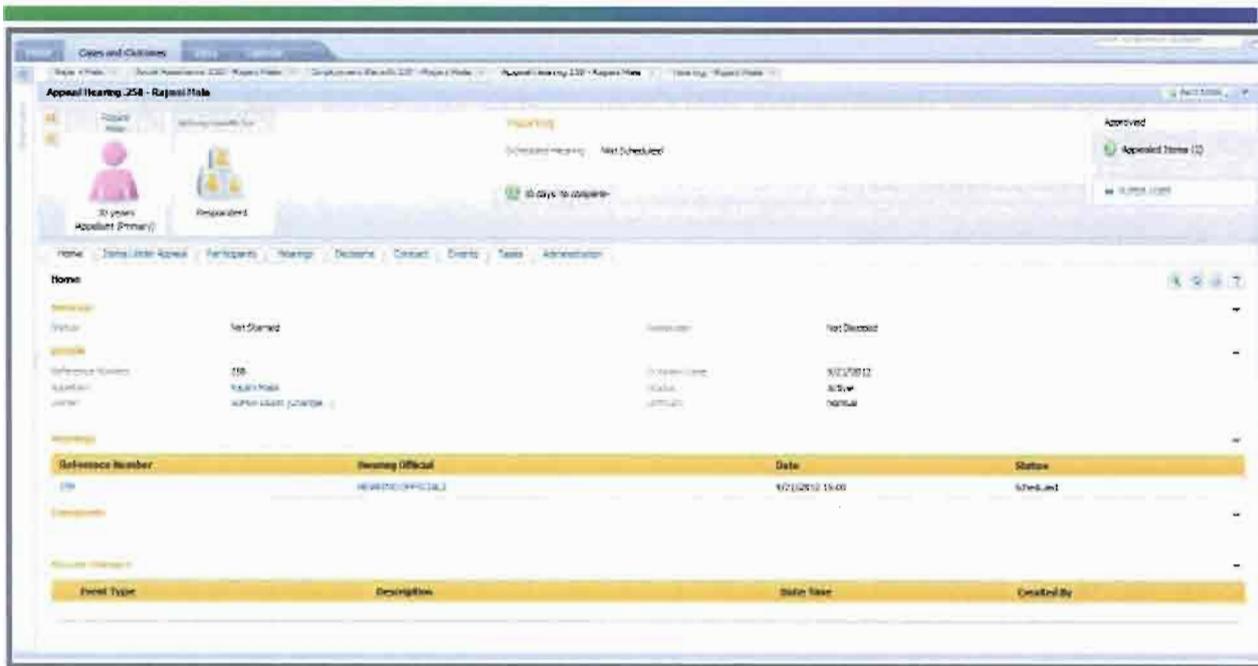

Figure IV-29: Hearing Case Home Page

Hearing Reviews

Hearing Reviews are the second level of appeal. A Hearing Review Case is created to appeal a decision on a completed Hearing Case. This second level of the appeals process comprises all of the process components supported and outlined above for hearings. Once a decision is reached at the hearing, the decision information is recorded by the hearing reviewers.

Judicial Reviews

The third level of appeal may involve a judicial review. A judicial review is an appeal that is conducted by a court to overturn a decision on a case or a prior appeal. A judicial review can be requested by a participant on the case, or by the Department itself, and is initiated by filing a petition with the courts. The court petition for judicial review appeals is a document attached to the judicial review case.

The ability to track the judicial review case, record the final decision and send the appropriate tasks to the case owner or other relevant Department personnel to implement the decision(s) will be supported by *SmartPro MedEE*.

The *SmartPro MedEE* is designed to maintain a comprehensive history of all transactions, activities, communications and decisions associated with all cases, including those associated with Appeals. Authorized users have the ability to access, update and review information based on the permissions or rights associated with their personal log-on credentials. When accessing historical Appeals data the user has the ability to quickly and easily sort information presented to promote review of data being requested. For example, information may be sorted chronologically, by appeal type, or initiator. <APP003, APP006, APP015, APP020, APP028>

An appeal is, effectively, a request for a review of one or more decisions on a program/service delivery, assessment delivery, case issue including an appeal of an exemption decision issued by the

Department, or a prior appeal case – whether generated by automated eligibility determination, by user or through an acceptable manual action. IBM Cúram Appeals supports the entire appeals lifecycle including the common business processes and industry best practices for appeals, which typically consist of the following steps:

- Appellant requests an appeal;
- Appeal case is created;
- Hearing is scheduled for appeal case;
- Hearing is held and completed;
- Decision is rendered for appeal case;
- Decision is implemented or further appealed and moved to next appeals level; and
- Case is re-assessed (this may be automatic or may be requested on demand).

The system's inherent configurability and flexibility will allow the Department to modify the process to coincide with MLTC's approved processes and procedures; for example, the inclusion of steps to address the Reconsideration process and/or include the appropriate steps and processes to address client exemptions and exemption status with regard to their responsibilities as they apply to the appeals process. <APP017, APP018, APP023, APP031>

The initiation of a Reconsideration or Appeal requires a minimum set of data. The system is designed to guide the user through the data collection process. On-screen indicators (*) identify mandatory data while on-screen edits scan data entered and inform the user of missing data. The edits are designed to direct the user to the specific field(s) that requires a response. Appeals data collected and maintained throughout the appeals process becomes case data and as such is stored on the *SmartPro MedEE* central database. This allows authorized users to access and review information as needed throughout the period the individual(s) continue their relationship with the Department. This feature also supports the Department's ability to exchange and share information with internal and external agencies such as the federal Hub, to support the Appeals process, and provide individuals with the data necessary to accurately manage Appeals cases. <APP001, APP022, APP037, GEN056>

An Appeals hearing case is used to manage the various aspects of the hearing. Specific data must be collected in order to create and maintain the case throughout the Appeals process which begins with specifying the appellant and respondent as seen in Figure IV-30. Client specific details such as demographic information are collected and maintained to allow the Department to determine and track the source of all appeals. Because data is centrally located, the Department has the ability to cross reference appeals, including multiple appeals filed by a single client or multiple appeals filed concerning a single action such as a change in policy <APP014, APP021, APP047>

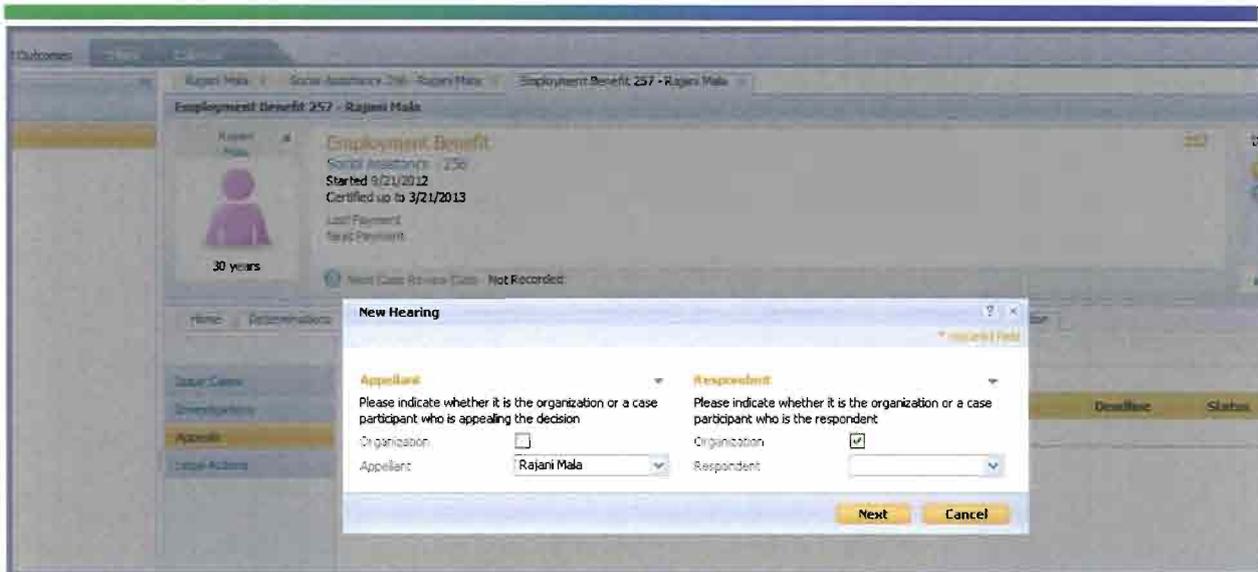

Figure IV-30: Capturing Appellant and Respondent Details

Once the appellant and respondent have been identified, the user may proceed with the creation of the hearing case. This and all steps throughout the process occur automatically through the use of the case specific workflow or series of steps that guide the user through the process. The Department has the option to implement the processes as delivered out-of-the box or to configure those processes to reflect MLTC-specific procedures. This involves entering the key data regarding the decision(s) being appealed, including the reason for the appeal and whether benefits for the appellant should continue or not. To continue benefits the authorized user sets an indicator to confirm the continuance, or discontinuance of benefits for the duration of the appeal. Capability is also supported to define the rules associated with the suspension of payments. A system generated unique case identifier or reference number is assigned to the Appeals case. The Appeals case is also linked to the Eligibility case(s) containing the decisions being appealed. <APP010, APP019, APP040, APP041>

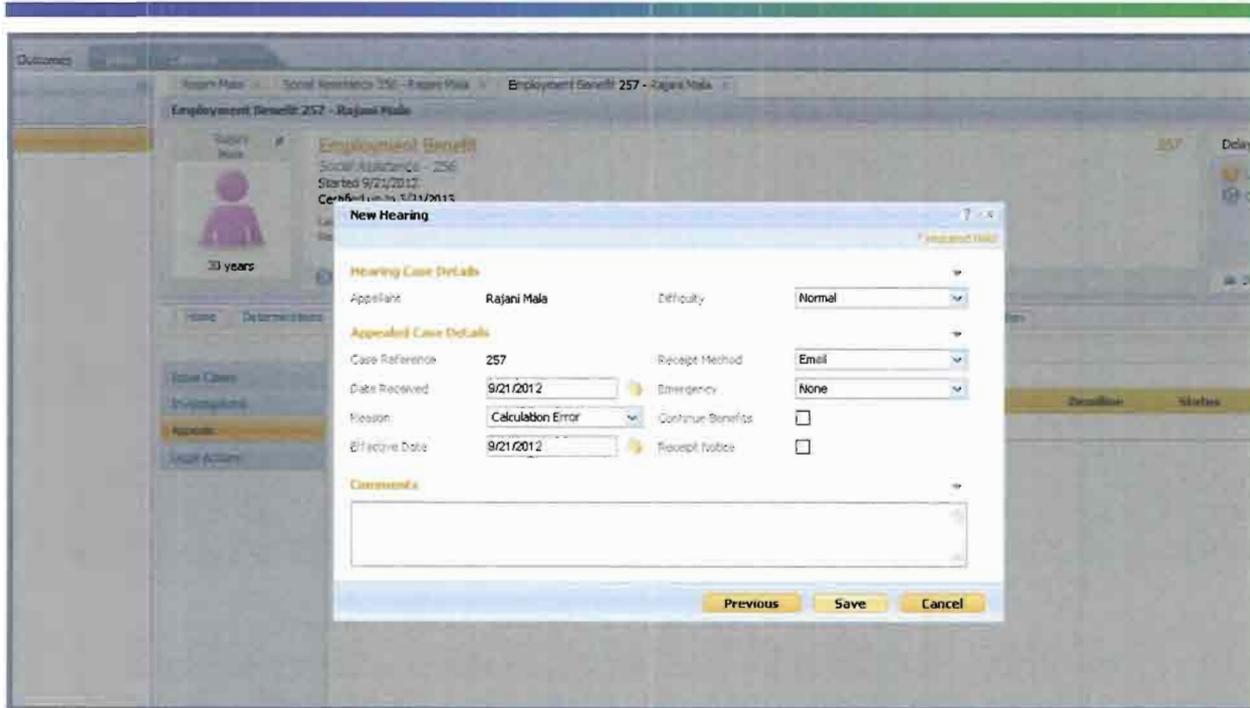

Figure IV-31: Creating a Hearing Case

The client, authorized representative, or Department staff will be guided through the data collection process. It is important to note that once data is entered there is no need to reenter that data. For example, as the client or worker initiates the process, all demographic and other required data already stored for the individual(s) such as the reporter's address are pre-populated from existing data. All required data will be collected and maintained to provide a comprehensive all case activity, track milestones or case status information throughout the process and to generate notifications to designated individuals at those milestones. <APP008, ELG044>

Once created, the case will be assigned to staff in accordance with the instructions provided by the Department. The assigned worker will receive notification of the newly assigned case via their home page. This notification will provide a link that will allow immediate access to the case allowing the worker to review available information and prepare for all subsequent tasks and activities. Should the Department opt to engage a third party to oversee the Appeal, the system will confirm this assignment generating notification to that agency or individual via the agreed upon channel i.e., email or letter. All correspondence with the third party will be maintained as a case artifact. Since all Appeals data will be stored in Cúram, our proposed solution will be modified to create a second instance of the record for an appeal. <APP011, APP016, APP038>

The structured Appeals process involves a series of tasks and activities that must be addressed in accordance with MLTC policy. The system will track the Appeals case throughout the processes notifying or alerting the worker of pending dates and tasks. The case will appear on the worker's home page, elevating in terms of priority, until the required activity is completed, verifications received and recorded or appointments have been documented as complete. Failure on the part of the worker to address their responsibilities in a timely fashion will automatically elevate the task to the attention of the supervisor or manager. <APP009, APP013, APP030, GEN055>

Cases can be reassigned by authorized users as needed. Managers have the ability to reassign a single or multiple cases in a single action. When reassigned the receiving worker will be notified via their home page or system generated notification and all tasks and events associated with the case will automatically be transferred to the newly assigned worker. Clients, authorized representatives and other designated individuals will receive notification of the reassignment as well as all changes to case status or transitions throughout the Appeals process. <APP012>

Case activities and other details are documented using the case notes feature. Notes will serve to record case updates, details of conversations or other contacts between the client, authorized representatives and members of the Department. Case notes can be accessed via the Appeals case by those authorized to do so. Once entered and saved the notes can be appended but not altered. <APP024, APP025>

Documents or verifications provide supplemental information that can be assessed and used when determining the outcome of an Appeal. Authorized users can attach multiple media types such as documents, pictures and videos, all of which become case artifacts. Verifications and other documentation may be required and requested throughout the Appeals process. To assist both client and worker, the system will track the availability of requested information, alerting the worker of missing information and notifying the client of the need to provide requested information by a predetermined date in order to conform to Departmental process and help the reviewer to arrive at the correct, most appropriate appeal decision based on all available information. <APP004, APP046>

Clients/beneficiaries and authorized representative must have insight into the status and other case activities and are able to access the case via the Public Self-Service portal. Their log-on credentials will grant them access to specified, case and client -specific details in order to review and provide additional information and details as needed. <APP033>

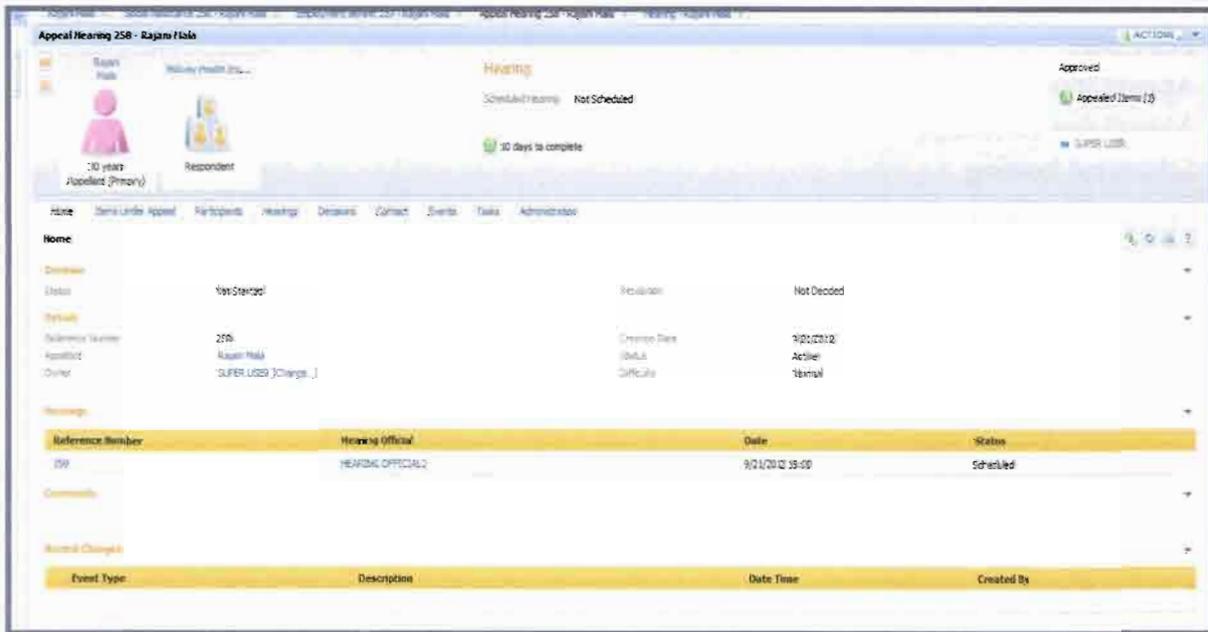

Figure IV-32: Example Hearing Case Home Page

Decisions

All decisions reached with regard to Reconsideration and Appeals requests will be recorded and maintained for historical purposes. Notification of these decisions will be auto-generated to the client(s) and authorized representatives. <APP005, APP029, NOT029>

Decisions upholding the original eligibility determination to reduce or discontinuation of benefits may require recovery of premiums or medical services paid during the continuation period requested by the client. This will initiate electronic notification to the Finance Office providing details concerning amount of the overpayment. The *SmartPro MedEE* can be configured to calculate the amount of misspent dollars and to initiate and track the collection of those funds from the client. The system will also calculate benefits owed to the client in the event that the appeal decision overturns an action to close the case or decrease benefit levels. <APP002>

The Appeals decision will determine the need to update eligibility status. For example, in situations where the Appeals decision overturns the original decision to decrease or terminate eligibility, the system will generate notification to the eligibility system with instructions to reinstate eligibility to pre-Appeals status and reimburse the client as the situation warrants. Notification to the client and designated authorized representatives will be generated to reflect the decision and resulting impact on eligibility. <GEN050, GEN053>

Hearing and Appeals Document Generation

IBM Cúram Appeals provides rich document generation features including automated generation of a range of appeals correspondence as listed below.

- Appeal cancellation
- Hearing continuance
- Court Petition
- Fee Letter
- Appeal request rejection
- Appeal request receipt
- Scheduled hearing
- Witness Notification
- Subpoena
- Decision notice cover letter
- Statement cover letter
- Transcription cover letter
- Status change

In many instances documentation is triggered as a result of various actions and requires little user intervention. For example, *SmartPro MedEE* can notify clients/beneficiaries that an appeal request has been received, of a change in the status of an appeal, that the appeal has been registered and assigned or reassigned, that verifications are required, and that verifications received do not meet the Department's standards. Support for dynamic insertion of decision clauses is provided through a Clause Administration functionality. <APP039, APP042, APP043, APP044, APP045>

Reports

The availability of information in readable, understandable formats is critical to program administrators, workers and other system users. The proposed *SmartPro MedEE* solution will, through the use of standard and online reports and user notifications such as alerts, ticklers or formal correspondence, address this need.

User home pages will present information concerning upcoming appointments and tasks. Case/individual links provide direct access to data specific to each task or event to authorized users.

The ability to review reports online allows the user to sort data in order to obtain time-sensitive case, individual and program data. <APP026, APP027>

Reporting

Requirements Addressed

ELG047

RPT001. RPT002, RPT003, RPT004, RPT005, RPT006, RPT007, RPT008, RPT009, RPT010, RPT011. RPG012, RPT013, RPT014, RPT015, RPT016, RPT017, RPT018, RPT019, RPT020, RPT021. RPT042, RPT043, RPT044, RPT045, RPT046, RPT047:

To support MLTC' reporting and analysis requirements, the *SmartPro MedEE* solution extracts data from the Cúram and other peripheral applications to populate the *SmartPro MedEE* data warehouse. IBM InfoSphere DataStage® will be used to Extract, Transform and Load the data contained in the *SmartPro MedEE* application to the data warehouse. The Wipro/IBM team will model the data mart in such a manner that most complex transformations, summary tables etc. are created at the data mart level itself. Datamarts will be scalable to allow data from other sources to be integrated to meet additional reporting requirements. <RPT027, RPT031>

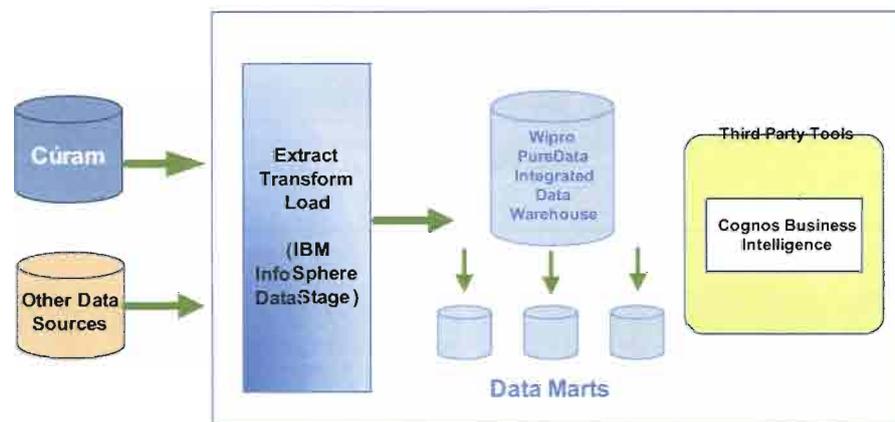

Figure IV-33: Reporting Architecture (High Level)

The Business Intelligence (BI) environment, which is implemented on its own set of dedicated Virtual Machines, backed by physical resources dedicated to BI. User response times are provided by

Cúram, Master Data Management and other capabilities on separate Virtual Machines and therefore not impacted by the BI environment. Additionally, the *SmartPro MedEE* will have a unified single BI gateway, similar to a custom built portal, to provide a smooth and richer experience in terms of integrating the supporting artifacts like metadata and data lineage. This will provide a better understanding of the underlying BI ecosystem. It will also enable integrating other BI tools to get a single tool agnostic view of State's BI platform. Based on our understanding of the current system, we know that multiple data warehouses/BI systems have been built using various other technologies, including SAP BO. If required, the existing BI artifacts can be integrated into the proposed portal environment to create a centralized BI repository. <RPT018, RPT028>

The proposed environment will also fulfill the other key BI requirements such as delivering reports in various formats, including, but not limited to, pdf and excel. The BI environment also supports versioning of reports, a standard Cognos feature. Cognos will also include the functionality to provide automated report delivery mechanism. The data warehouse architecture is portrayed in Figure IV-34: Information Delivery Architecture. <RPT035>

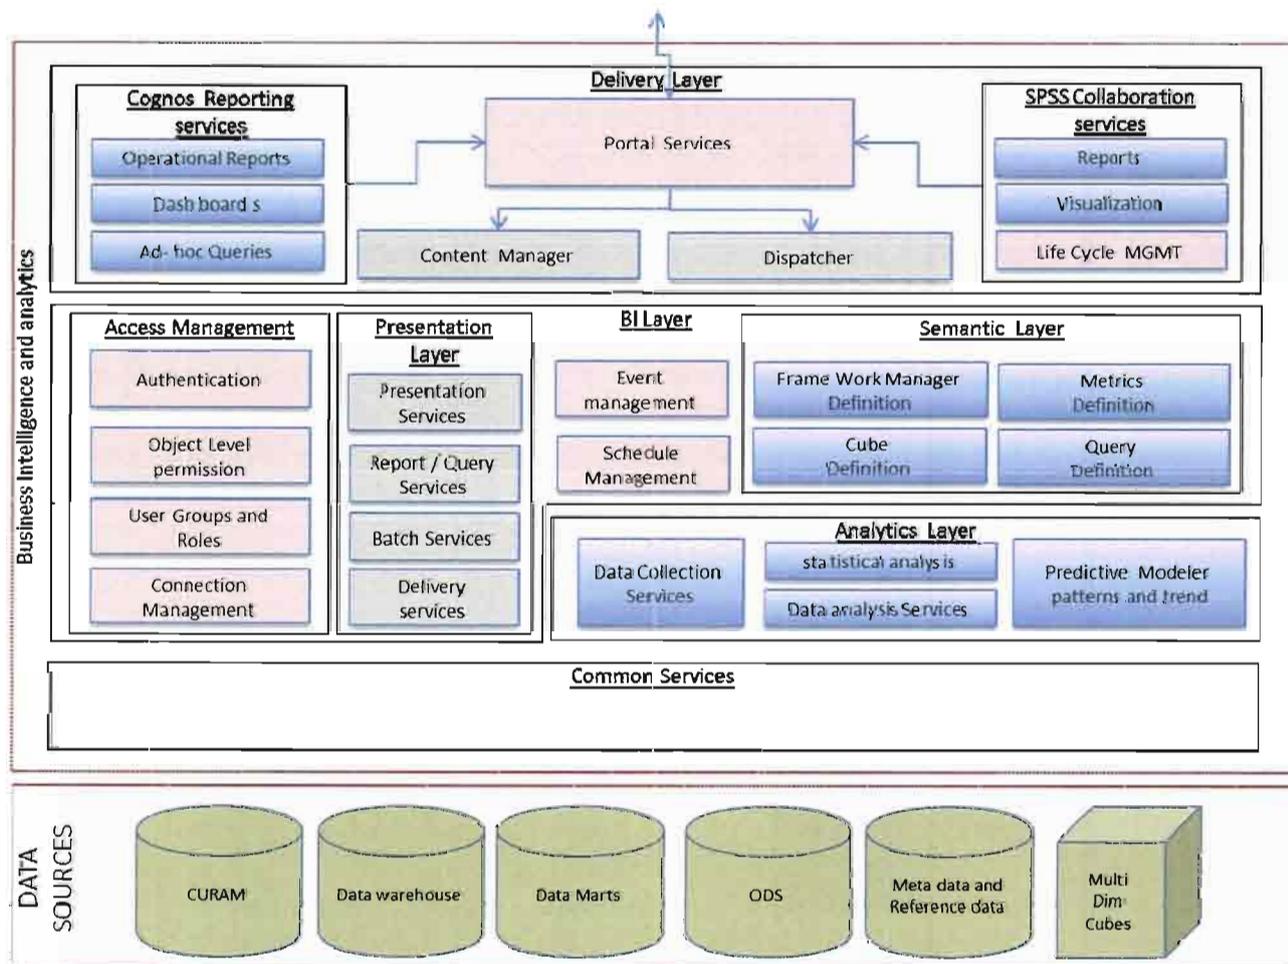

Figure IV-34: Information Delivery Architecture (Detailed)

A multi layered Semantic layer will be built using Framework Manager as a part of this exercise to abstract the technology complexity and bring more meaningful business terms for the measured Key

Performance Indicators (KPIs) which have been built as a part of the Data Warehouse (DW) creation. This Semantic layer brings a greater ease of use and understanding for the end-user community. The same semantic model will be reused and published in the portal for the power users and ad-hoc reporting needs.

The framework model will be designed with data source as the data mart. Multiple Framework manager models /packages will be built to support the business areas:

- Program Reporting
- Member Reporting
- Utilization Reporting
- Program Integrity Reporting
- Management reports <RPT015>

The Wipro/IBM team recommends that MLTC staff authorized to access the solution's reporting feature attend training on the use and benefits of Cognos, the proposed reporting tool. The training will also be used to elicit feedback from Department staff. This feedback will then be used to design and develop reports required by the State.

Report delivery

The Cognos Reporting environment will be implemented to support the Department's reporting needs. Once trained, MLTC staff will be able to run ad-hoc queries and produce reports needed to monitor caseloads, program usage and expenditure, worker productivity and overall departmental operations. <RPT032>

Cognos Connection, the Web portal for Cognos, allows authorized staff to access and publish, find, manage, organize, and view the organization's reports and scorecards. Cognos Viewer, will also allow staff to view reports.

Query Studio will be the reporting tool for creating simple queries and reports in Cognos, the Web-based reporting solution. Casual or novice users use Query Studio to create ad hoc reports that answer simple business questions. Query Studio is an easy-to-use reporting tool. With minimal steps, you can author basic reports, change the report layout, filter and sort data, add formatting, and create charts. This studio will be used by State's business/operational staff and authorized external users.

Cognos Query Studio enables you to build custom ad hoc reports that you may share with other Cognos users. Also, IBM® Cognos® Real-time Monitoring is an operational business intelligence solution designed to provide easy access to consistent data so you can react quickly to revenue and cost-saving opportunities. Cognos Real-time Monitoring features self-service, interactive dashboards with operational key performance indicator (KPI) measures for frontline business users, executives, managers and analysts. Cognos Real-time Monitoring features include:

- Self-service query, reporting and analysis from virtually any data source.
- Business-defined alerts about sudden issues that need attention.
- Patented memory-based data store for continuous data integration.
- Real-time data navigation that can help you investigate the root cause of an issue

- Drag-and-drop dashboard environment that enables you to add real-time, formatted information to your historical business intelligence. <RPT025, RPT045, RPT046>

Report Studio is the professional reporting tool for Cognos. It will be used to author more complex reports. Report Studio offers greater flexibility in calculating and formatting results. Report authors can open Query Studio reports to create more advanced reports. Report Studio is a report authoring tool that professional report authors and developers use to create sophisticated and managed reports. Use Report Studio for reports that are intended for a wide audience, exist long enough to require maintenance for changing requirements and data, and require detailed control over the appearance. Report Studio provides powerful functionality, such as bursting, prompts, and advanced charting, and provides many ways to customize reports. When you use Report Studio, data is not visible. You must run the report to view current data. Within State EES, the IT staff and some advanced Operations staff will use this studio.

Analysis Studio is the analysis tool for Cognos. Use it to explore, analyze, and compare Dimensional (cubes) data. Analysis Studio helps you answer business questions by finding meaningful information in large data sources. Managers and business analysts use Analysis Studio to explore and manipulate data so that they can analyze their business. Users can quickly analyze critical corporate data from any angle to understand why business events occur, and then make effective decisions. With analysis, it is possible to see trends and highlight exceptions that may not be evident with other types of reporting. Analysis Studio users can explore large volumes of dimensional data. When you use Analysis Studio, you interact directly with visible data.

Metric Studio will create a customized score-carding environment to monitor and analyze business metrics throughout your organization. It helps you translate your organization's strategy into relevant, measurable goals that align each employee's actions and accountability with a strategic plan. The score carding environment of Metric Studio shows you quickly where your organization is successful and where it needs improvement. It tracks performance against agreed targets and indicates the current status so that decision makers at every level of the organization can react and plan. With Metric Studio, you are self-sufficient and can readily see how the organization is progressing against its strategy. You can set priorities for your own actions and understand how your decisions affect the performance of the MLTC and their operations <RPT024, RPT041, RPT042, RPT043>.

Event Studio is the event management tool for Cognos. Use it to notify decision-makers in your organization of events as they happen, so that they can make timely and effective decisions. Event Studio ensures that critical information is detected quickly and delivered to key stakeholders in your business. You can create and manage processes that monitor data and perform tasks when the data meets predefined thresholds. By using Event Studio, decision-makers in your organization can be notified of business events as they happen so that they can make timely and effective decisions. Use Event Studio to create agents that monitor status changes, priority customers, or any other condition that is important to your business. When an agent detects an event, tasks are performed, such as ending an email, adding information to the portal, and running reports. <RPT004>

Required security will be built in the reporting layer so that only those users authorized to view the reports are given the access. Separate level of security will be implemented per the various categories of reports based on user’s admin details, hierarchical level of the users etc.

Access to reports and the ability to create and run queries is role-based. As such, security will be built in the reporting layer, allowing authorized users to view reports they are authorized to access. Separate levels of security will be implemented based on instructions provided by the Department.

Security includes both authentication and authorization, as described in figure below.

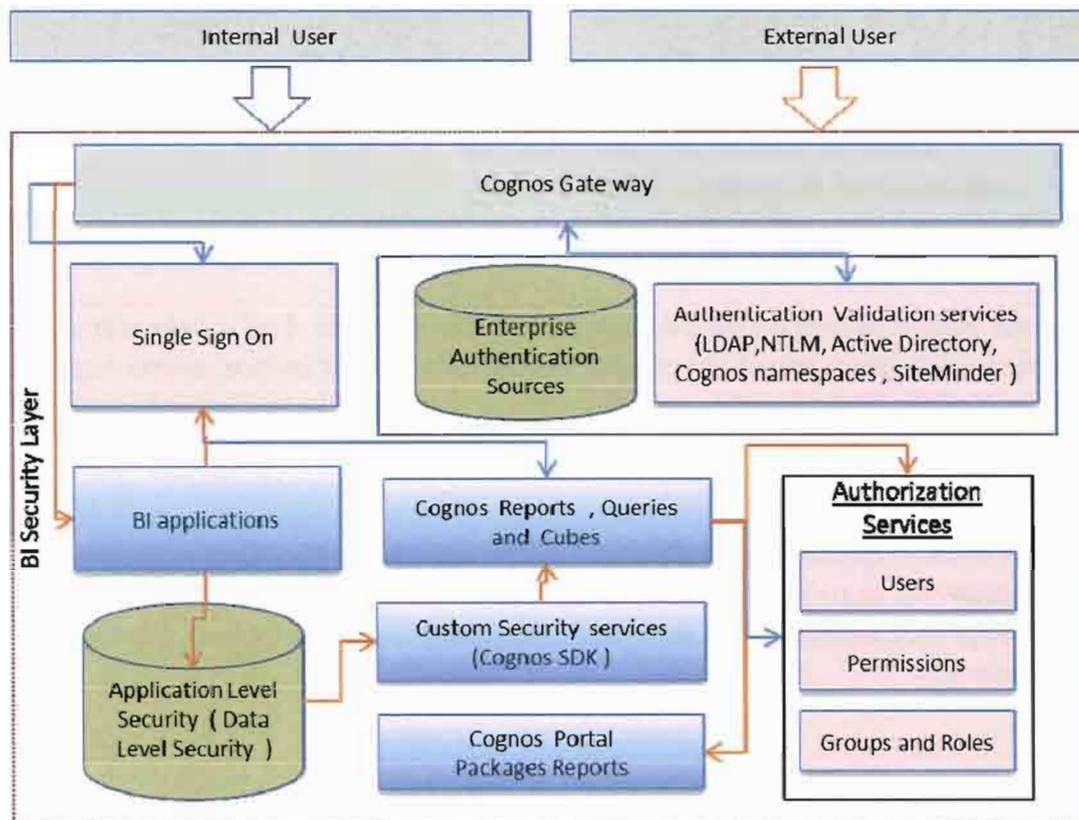

Figure IV-35: Cognos Security Architecture

Authentication is the process of securely validating a user’s identity, and is generally associated with “logging on.”

Internal users will be authenticated utilizing the State’s LDAP system. This will ensure ISF compliance and enable SSO. The Portal Gateway protects the Cognos Portal URLs.

Wipro/IBM proposes to store external user’s authentication within each individual reporting application’s custom security using database/row level restrictions. To be able to authenticate external users a “view” of the stored external users user id will be available for Cognos to authenticate against. The “view” will require System Development Kit (SDK) development. The SDK provides the necessary Cognos and authentication source code to map internal groups and roles to the portal package, report studio and report run security.

The authentication login page will need to be done through each application to ensure ISF compliance based on each custom application’s processes. Once authenticated, the user will be

directed to a new Cognos Reporting environment portal URL created specifically for SDK routing which will require the SDK to send through the security namespace that will be used based on the application it is being routed from.

Authorization is the act of determining what capabilities and access an Authenticated User will be granted. Authorization will be role based. There are many levels of authorization.

User Type

This distinguishes the Cognos Reporting environment license user type:

- Consumer/ report user – can view, filter, schedule, notify, and drill pre-authored reports
- Author – consumer role plus can use Query Studio
- Analysis – consumer role plus can use Analysis Studio
- Manger – consumer role plus can use Metric Studio
- Remote Recipient – view reports from MMIS custom websites
- Object

This will state what specific objects the person through their role can view. This is done within Cognos Reporting environment’s security setup. For example, this would include reports that would be managed through public folder security and data elements that would be managed through the metadata/package security. <RPT021, RPT034>

Content

Content security is down to the data ‘value’ level and will be managed within Cognos Reporting environment’s security. For example, if a Provider can only see data related to their Provider ID, this would be accomplished through filters at the metadata, group, role, or user level, depending on the detailed requirements.

Vital Trust Data

Corporate Information Security Framework mandates certain levels of security based on the type of data content. For example, higher levels of security are applied to Vital Trust data versus General data. Each application has processes around the display and storage of their Vital Trust data based on the ISF compliance rules. Since these security rules are controlled within each application (based on the data), a security script will be written within the Cognos Reporting environment to recognize these rules i.e. who can see full text, masked text, or no text.

Data Visualization

Wipro/IBM proposes to use IBM® Cognos® Visualizer as it integrates easily with the Cognos BI and provides high impact visuals that deliver a quick knowledge transfer. Some other features which make it an obvious choice for enabling better visualizations and dashboards are

The visualization engine will leverage data from the data marts and DW. The different ways in which the data can be displayed for the State’s users include the following.

- Geographical data (e.g. Utilization by Region) – Map
- Data over time , ratio data, comparison of linear data – Chart

- Trends, Outliers (e.g. Exception cases in Fraud etc.) – Combination of line and bar graphs, control limits, etc.
- Snapshot data, single values (i.e. KPIs) – Gauge
- Multidimensional data - OLAP
- Other graph types for data presentation, including:
 - Pie chart
 - Side-by-side bar charts
 - Single and multiple line charts
 - Tree graphs
 - Probability plots
 - Trend lines
 - 3 dimensional graphs
 - Parallel coordinates
 - Control limits

Other common-use graphical presentation methods allowing drill down capabilities wherever required and possible.

Wipro/IBM will analyze the chart types; including swatch, value, parallel coordinate, box and whisker, gauge, histogram, thermometer, control limits, trend charts (and more) will fit in for data visualization in various dashboards and reports to quickly analyze various KPIs as well as allow the users to analyze the root causes of performance from different perspectives. Some other factors which will be considered include:

- Correctly identifying KPIs suitable to be depicted in each dashboard and end users requirements from the dashboards.
- Multi-metric display: EES users are able to simultaneously see many metrics in an easy to understand visual formats and aggregate displays combining KPIs as well as allowing trends and connections to be easily spotted
- Interactive Exploration with drill down, rotation, zoom etc capabilities to focus on specific data points/patterns.
- Integration with Cognos BI platform <RPT026>

Visual Aesthetics and Layout and Clarity: Logical and Fluent order and proper placements of controls, and various drill down options. <RPT002>

Management reports will be enabled by leveraging the pre-populated KPIs provided through the data model. The business requirements are grouped under business oriented subject areas. These will serve as the main entry point to enable reporting for business users.

The proposed BI environment will have appropriate operational, tactical and strategic KPIs to enable the below reporting requirements.

- Program Reporting, including a branch report
- Member Reporting, including County, Region and worker
- Utilization Reporting
- Program Integrity Reporting

- Business Intelligence Reporting

The State's requirements will be grouped under the subject areas. The KPIs will leverage the structured data dictionary that defines the business terms and phrases used in healthcare industry and the inter-relationships among those terms and phrases. A semantic layer enables some of the following key benefits. [RPT008, RPT014, RPT047]

- Represents the data requirements of a health plan
- Standardizes enterprise business terminology
- Is a business entry point to the data models
- Clarifies misunderstandings among lines of business and improves business-to-IT communications
- Is expressed in plain business language
- Is organized by subject areas
- Can be used as inputs and outputs of process and activity definitions.

Business terms and KPIs will be leveraged to be modeled into subject areas to enable business friendly ad-hoc reporting of data elements loaded from the Cúram database <RPT001, RPT029>

Subject areas help to group key health plan indicators and answer relevant business queries. They can also be leveraged for usage in dashboards, reporting applications and ad-hoc reporting. The subject areas provide an entry point from business to the physical implementation. Management reporting require reporting leveraging both subject area specific KPIs and also cross-subject area KPIs.

Wipro/IBM proposes to conduct workshops to identify KPIs across relevant business processes and finalize a comprehensive KPI list which will be leveraged across all management reporting. This is also expected to unearth / resolve discrepancies in terms of KPI nomenclature and interpretation across different business groups.

Supervisor Workspace provides supervisors and managers with dashboards to manage the cases (including households which are Integrated Cases) within their span of control that includes cases with issues. Cases for review will appear in their task list. <RPT016>

The EES, through Cúram Case Audit, supports configurable QC sampling, that enables the Department to sample by region or other grouping construct, perform random sampling, perform stratification sampling, and to sample by a wide variety of other criteria. Cúram Case Audit ultimately enables a user to configure an SQL statement, through a configurable field, which can select a list of cases using any filtering clause possible in SQL. Sample size, month or year of sample, can be used as filters through the above mechanism. <RPT009>

The EES provides a mechanism to create the universe from which the system pulls samples. The universe will be the complete list of eligibility cases in the system. The sampling logic described above will return a sample list of case IDs. <RPT010>

The EES, through Cúram Case Audit, supports a user role known as an "Audit Coordinator". An authorized audit coordinator can manually add cases to or remove cases from the sample. Comments can be provided to explain why changes are being made to the sample. <RPT011>

A history of case audits completed is maintained in the EES. Modification will be required to support the result categorizations listed here. <RPT012>

The federal and state reporting will be enabled through the data sharing architecture which will generate feeds in the required standard/formats. Federal and state reporting will include the ability to generate data and reports needed to apply for and demonstrate appropriate use of federal grant funding sources and will document the appropriate benefit programs, projects or other categories impacted by system or human actions to support claims for federal matching funds. The EES will also be able to differentiate funding source based on MLTC-specified criteria. The Cognos reporting also includes HUB application status reporting, including pending reports based on citizenship. All information subject to the privacy act will be safeguarded and data will be encrypted before submission. <RPT003, RPT036, RPT037, RPT039, RPT040, ELG047>

A metadata driven reusable extract routines will be built as a part of the state/federal reporting. All the reporting criteria for each external agency will be stored in this metadata repository. This approach will enable the State to easily adhere to the State and Federal data requirement changes. The ETL extraction routines will use this metadata to build appropriate data sets and the same will be stored in a designated location in various formats including but not limited xls, csvs, etc. <RPT013>

The final list of reports required will be finalized during the initial planning and scoping phase. In addition, some reports are produced from within the Cúram application itself. One of these reports includes the Mass change processing report, which is performed via Cúram batch jobs that produce control and error reports as part of their standard processing. <RPT030>

User Interface

The User interface will have a simple, intuitive interface that is fast and customizable. The User interface system will have an open, extensible architecture that allows integrating almost any electronic resource via a portlet/web services. Basic Functionality that the user interface layer will cater to includes

- Processing of user-entered information
- Interaction with authentication and affiliation services
- Validation of input
- Submitting requests
- Retrieving and formatting results
- Directing UI process flow and display of pages or portlet components based on conditions such as data, clicks on hyperlinks, errors, user's privileges, etc.
- Establishment of UI sessions and storage and retrieval of session data

The environment will be enabled with various delivery capabilities like query results exporting to various formats e.g. excel / pdf / HTML/ XML Report delivery can be enabled through email, printer or saving it to a predefined folder with data and time identified. Reports will be generated on frequencies as per business requirements and Wipro/IBM will provide user manual explaining non-It users how they can schedule new reports or re-schedule existing reports. The solution will be built to scale to futuristic BI delivery needs like mobile based dashboards, office integration. Additionally, <RPT005, RPT006, RPT007, RPT019, RPT020, RPT022, RPT027, RPT033>

The Cúram document management interfaces with the State's Hyland OnBase imaging and document management solution and associates all documents and reports received with the appropriate case or case participant (person) so that they can be accessed directly from the case file and be shared across programs and agencies with anyone with appropriate authority to view the case. <RPT023>

To generate an inventory of current and available reports, Cognos includes standard auditing features as well as an IBM Cognos SDK application that provides additional auditing, including Role Auditing, folders, reports, queries, etc. <OPS008, OPS012, RPT044>

The Wipro/IBM team will make sure that the existing reports, metadata and documentation is studied properly, a thorough assessment and gap analysis (with expected reporting BI functionality) is done and then the reports are designed and developed using Cognos.

Training

Wipro/IBM will develop a robust training solution that will be aligned with the learning needs of the various target groups. Custom training programs will be created to meet State BI users' specific training requirement.

The key aspects considered for finalizing the BI training solution will be as follows:

Training planned before and during User acceptance Testing – Training will be provided weeks before and during the User Acceptance Testing so that business users spend optimal time from their day-to-day activities and whatever training they receive can leverage and test during the UAT period.

Training road maps for users – There will be role based training road maps designed for the business users, Power users and Data Administrators.

Instructor Led Training (ILT) approach – Training will be delivered to the users in classrooms/space provided in the State's office to equip them with the required knowledge and skills to use the new system.

Training materials - The training materials to be used by the instructors to deliver the training will be designed and developed by Wipro/IBM team.

Self-Paced Learning approach – In addition to classroom training, **Self Paced Training content** will be designed to provide an overview and reinforce key takeaways from the classroom in a self-paced mode.

Recap and Quiz – Quizzes might be designed for each class room session and web based training to check the understanding of the users.

Training Aids – Work Instructions, Job Aids and Quick Reference guides will be created for various target groups to support the users during training.

Training courses developed for *SmartPro MedEE* will interface with the State's LINKS Performance Management and Training Systems leveraging standard LMS protocols to facilitate user community access who are familiar with this system. (GEN021)

Administration

Requirements Addressed:

GEN020, GEN022, GEN033, GEN043, GEN060, GEN061, GEN066, GEN070, GEN071, GEN072, GEN075, GEN077, GEN078, GEN082

OPS011, OPS018, OPS019 OPS020, OPS021, OPS030, OPS033

RPT009, RPT010, RPT011, RPT012

The Department is tasked with the administration and oversight of state and federal benefit programs and must comply with reporting requirements that are tied to receipt of federal dollars. The *SmartPro MedEE* administrative features and capabilities will empower the Department to meet all federal and state reporting requirements and configure workflows and processes that will allow it to automate business processes that will incorporate efficient and best practices and implement consistent processes across the organization.

Federal and state legislation define what and how human services organizations can serve the public. State and department policy must reflect legislation to make certain that consistent work and activities are followed. Workflow can automate policy and procedures to confirm that they are followed, track the time and actions taken and record the entire process.

One example of workflow in a Medicaid/CHIP case follows is:

Business Process	Workflow
Application filed	<ul style="list-style-type: none"> • Capture the date and time the application was submitted
Client proof of residency provided (driver's license)	<ul style="list-style-type: none"> • Capture the event
A scanned image of the driver's license must be captured and associated with the application before allowing the application to be considered valid	<ul style="list-style-type: none"> • scanned image attached to the application/client file
If after 5 days of a member application being created, and the application is not still invalid, a message is sent to a supervisor to review	<ul style="list-style-type: none"> • Assign case • Notify worker via worker home page – case details – name, case type, processing timeframe • Track processing timeframes • Capture the acknowledgement of reading a message • Set the status of the application
If the application has been received by the organization, and verifications are not completed in 45 days, the application is marked as invalid or closed	<ul style="list-style-type: none"> • Capture the events as history of the workflow from end to end

SmartPro MedEE workflow will support the automation of the Department's business processes and work allocation. MLTC will define and maintain workflows to confirm adherence to best practices

which in turn will result in expeditious and consistent processing of cases and case activities. Cúram Workflow combines the ability to implement business processes consistently along with the flexibility to rapidly respond to changing business needs.

An integral part of the IBM Cúram Enterprise Social Program Management Platform, Cúram Workflow provides a set of features that will allow the MLTC to define reliable and repeatable work patterns to effectively support organizational business processes and service delivery capability. These features include a framework for defining and maintaining workflow processes and an integrated workflow engine to execute these processes at runtime. <OPS019>

The two principal functions that Cúram Workflow serves are:

- Automation of business processes through the definition and maintenance of workflow processes.
- Support for managing the allocation of work items associated with workflow activity steps among machine resources, individuals, and organizational units. <OPS030>

Business process automation is achieved through the definition of workflow processes which describe the activities in a workflow and the transitions between them. An activity in a workflow may be manual or automatic. Manual activities typically involve user intervention, whereas automatic activities are typically performed using system resources. Transitions describe the sequence of activities and how they are linked together. They may be associated with conditions that are used to determine a particular flow through the process.

Workflow

The *SmartPro MedEE* solution uses IBM Cúram Workflow to automate business processes, generate alerts to users and assign tasks. The two principal functions served by IBM Cúram Workflow are:

- Automation of the steps involved in business activities through the definition and maintenance of workflow processes.
- Support for managing the allocation of work items associated with workflow activity steps among machine resources, individuals and organizational units.

Workflow functionality is built into the internal and external portals that provide intuitive alerts and task management. Events such as deadlines and appeal timeframes can automatically trigger workflow processes to assign tasks to workers. The Cúram Administrator portal allows for monitoring, management, and configuration of workflows.

Inbox

Users manage their workload from the Inbox. A toolbar shortcut to the user Inbox is available on each page in the application. The Inbox provides the functionality necessary for the user to manage workload. Options are provided for creating, reserving and searching tasks, as well as managing work queues and notifications. Users can create tasks for a variety of reasons; e.g. send a notification task to another user advising the user of a case that has been transferred to them. <OPS033>

Reserved Tasks represent those tasks which a user has accepted, or “reserved”, for action. Once a task is reserved, it is removed from the list of Assigned Tasks and added to the list of Reserved Tasks. This allows the user to work exclusively on a particular task.

Assigned Tasks represent tasks which have been allocated to an individual user or to a group of users. For example, a task may be allocated to a particular job such as an “Eligibility Specialist” which results in it appearing in the assigned task list of every user who holds that job. In order to work on a task a user must first reserve the task. This action removes the task from the Assigned Task list. <GEN070>

Working with Tasks

Clicking on a particular item in the My Tasks graphical area presents the user with a list of the tasks associated with that item. The list of tasks can be sorted on the column headers. From the list page, users can quickly navigate to the relevant task home page by single-clicking on either the “View” or “Task ID” links. An example task home page is shown in “Example Task Home Page”.

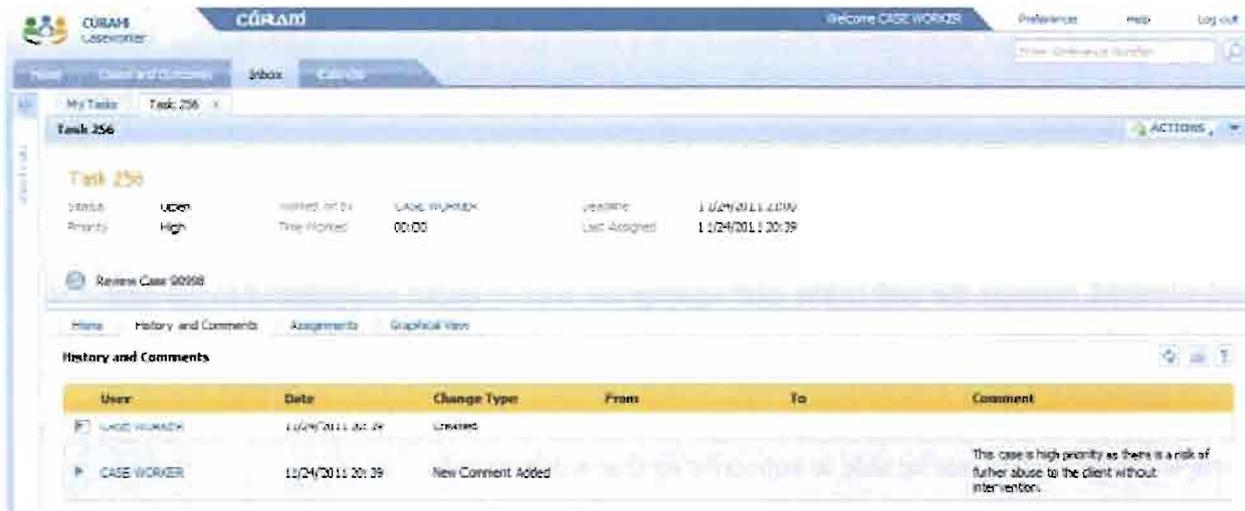

Figure IV-36: Example Task Home Page

The task home page serves as the central point for managing a task. The user can open a task, read the instructions, perform the work necessary and then move the task along by reassigning, reallocating or closing it. A number of additional operations can also be carried out including recording the amount of time spent working on the task, adding comments, forwarding, deferring or restarting it.

Task deadline strategies can also be created to ensure that a task is processed by a user in a timely fashion. In the example shown above, a deadline date and time is specified for the task. This deadline, for example, could be associated with a strategy that involves escalating the task to a supervisor, reassigning the task to another user or changing the task priority. From the task home page, the user can also view a history all actions taken on a task by selecting the “Task History” link on the page. <GEN071, GEN072, GEN078, GEN082>

Task creation is also incorporated into Cúram Workflow processing. For example, tasks can be automatically created and assigned to specific users or work queues based on an allocation strategy. Typically, automatic task generation is used in situations where specific manual activities need to be undertaken. For example, a change in circumstance for a client might result in an overpayment situation. This would likely require user intervention to negotiate and agree to terms for recovering the overpayment. Also, when automatically generated tasks are actioned, the task can be

automatically closed by the system. Whether a task has been automatically closed by the system, or manually closed by a user, the task is removed from the user's task list and is thus logically 'archived'. <GEN075, GEN077>

Task "queries" can be set up by a user. Task queries allow the user to search for tasks based on specific criteria and then save the task query to be run as desired. This allows users to save the searches that they most commonly use for tasks, thereby reducing time spent working with tasks. <GEN078>

Work Queues

Work queues are subscription-based queues to which tasks can be assigned. Using the Cúram administration application, authorized users can setup and manage work queues, as well as define the users subscribed to the work queue. Optionally, if a work queue allows user subscription, users can manage their own work queue subscriptions and can therefore subscribe to one or more work queues as appropriate.

Work queues are typically accessible by groups of users. Work queues could, for example, be defined to route work to specialists who are trained to deal with circumstances that require a particular expertise. Once users are subscribed to a work queue, they can reserve a task from a queue, carry out the work required, reassign the task to the next appropriate user or queue and proceed to the next task waiting in the queue.

Each work queue is assigned a sensitivity level. This empowers administrators to restrict access to specific work queues based on a user's sensitivity level. A user with a sensitivity level less than that of a given work queue will not be able to subscribe to that work queue.

Developing Business Process Workflows

Business process automation is achieved through the definition of workflow processes. A workflow process consists of activities and the transitions that occur between them. An activity may be manual, where user intervention is involved, or automated, where the activity is performed by a system function. Transitions control the sequence of activities and the conditions that determine a particular path through the process. Workflows are developed using the Workflow Process Definition Tool (PDT). The PDT is provided as part of the Cúram administration application and is used to define and maintain workflow process definitions.

The development of a workflow process involves defining the workflow activities, the transitions between these activities and the data elements that pass through the workflow process. The data required to initiate a new enactment of a workflow process is also defined. The administration application is also presented as an online web application. An example of the PDT showing a workflow process home page is illustrated in Figure IV-37: Workflow Process Home Page.

Figure IV-37: Workflow Process Home Page

Creating or editing a workflow process involves activities, transitions, workflow data objects and enactment mappings.

Activities

An activity in a workflow process definition specifies a discrete item of work that must be completed for a workflow process to progress. There are a number of standard activity types available for creating a process definition.

Notifications – often referred to as “ticklers” – can be also be defined and associated with workflow activities. Notifications provide information that may be of interest to a user or a group of users. For instance, if a workflow process automatically closes a case, a notification can be sent to the appropriate user(s) advising of this action. Notifications differ from tasks in that they typically do not require a user to carry out an action. Notifications contain subject text, body text and links to relevant application pages. They can be issued in the form of an Alert, an email message, or both. Alerts appear in a user's list of notifications, available from their Inbox, until they are acknowledged by the user. E-mail notifications appear in the inbox of the user's e-mail system. Within a single workflow process, multiple activities can be defined, allowing for activities to be performed by various users. <OPS020>

Transitions

Transitions determine the flow of execution in a workflow by providing the links between activities. A transition may optionally be associated with a transition rule which is an expression that evaluates to “true” or “false” and is, effectively, a condition or set of sub-conditions that must be met before the transition will be followed.

Where multiple transitions are involved in an activity, these are termed ‘splits’ or ‘joins’ depending on whether it is entering or exiting the activity. Splits and joins can be defined as Parallel (AND) or Choice (XOR) transition types. From a Parallel (AND) split, the flow of control within a workflow can therefore take multiple branches simultaneously, with each branch executing in parallel.

Workflow Data Objects

Workflow Data Objects (WDOs) act as containers to hold relevant data items used throughout the workflow. WDOs can be mapped to items in a workflow such as activities, transition conditions, loop conditions, and parameters: that require data to be passed into or out of it. The WDOs can contain a number of attributes which represent the individual data items that will be mapped to the activities. <OPS021>

Enactment Mappings

Enactment Mappings relate to the specific data required to carry out a workflow process. For example, in order to enact a workflow process for a particular case, a 'case ID' is typically required to identify the relevant case. Enactment Mappings provide the mechanism to retrieve the data necessary to start a new enactment of a workflow process and determine how this received data should be mapped onto the WDOs.

Review of the workflow process is accomplished using the workflow process graphical view. This is included as part of the PDT and is a visualization tool which provides a graphical image of a workflow. Figure IV-38: Graphical Representation of a Sample Workflow shows an example of a screenshot reflecting a workflow as displayed by the visualization tool.

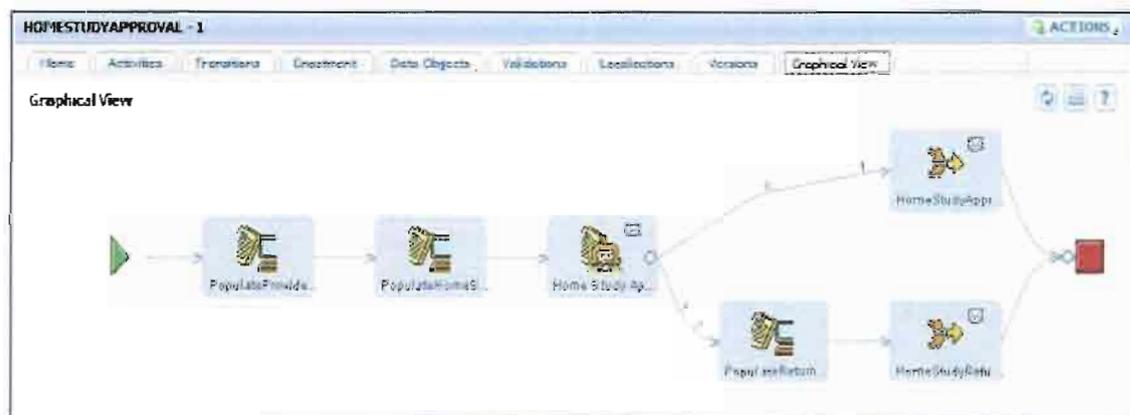

Figure IV-38: Graphical Representation of a Sample Workflow

The ability to validate workflow process definitions before they are released into production is also provided in the PDT. This functionality is used to check the process definition against a series of validations and to report errors arising in either the overall workflow or in specific activities or transitions. These checks assist in producing a valid and well-formed workflow.

Managing/Monitoring Workflow Processes

Workflow process enactment will predominantly be transparent to business users of the system. Authorized administrators, however, will use the Cúram administration application to monitor and maintain workflow process instances, process instance errors and workflow events. In addition to the administrative functions of the Process Definition Tool (PDT) and work allocation features described above, Workflow Administration also provides the following functions that enable an administrator to monitor and control process instances executed by the workflow engine.

Process Instance Search

The Process Instance Search function allows an administrator to search for process instances in a number of different ways, including by process details, by task details and by event wait details. These options allow an administrator to quickly locate a process instance in order to facilitate analysis or diagnosis of workflow progress.

View Process Instance Details

This function may be used by the administrator to view the details and progress of a process instance. It allows an administrator to view the values stored in the workflow data objects for the process instance. This view also shows the activity instances that have been executed at that point in the process instance. There is also the option to view the process graphically.

Suspending, Resuming and Aborting Instances

Workflow Administration provides the ability to suspend, resume, and abort workflow process instances. The suspend function allows the administrator to pause and in progress process instance; the resume function is used to restart a suspended process instance, and the abort function is used to terminate an in progress process instance.

Handling Process Instance Errors

Errors encountered by the workflow engine during the execution of a process instance are displayed in the process instance error list. The administrator can choose to retry the associated process instance after performing the required remedial actions, or abort it.

Executing Workflow Processes

IBM Cúram Workflow provides work allocation features for assigning work items to system resources, individuals and organizational units. Allocation strategies determine how work is distributed to individuals or groups. The supported allocation strategies include specific targets, and rule-based and function-based approaches. Once a work item has been allocated, it becomes a task for an individual who can view and take action required by the task. Tasks may be associated with notifications in the form of alerts or “ticklers”.

Tasks are used to assign and track a user’s workload. They may be assigned to, and by, automated processes, individual users, or groups of users. Users can be associated with jobs, positions, organizational units, or work queues.

Rules Engine

The *SmartPro MedEE* solution leverages the IBM Cúram Express Rules (CER) Engine for comprehensive rules management capabilities by providing rich, prebuilt rules content, a rules composition and execution environment. The CER Engine provides a standalone rules engine that executes business rules in isolation. Business administrators utilize the Cúram Administration portal to manage rules, programs and rates.

Cúram provides robust capabilities to handle eligibility and entitlement determination including rules-based business processes; Cúram has been designed to address the unique challenges faced by health and human services agencies with regard to rules management in support of program delivery, organizational efficiency, and enhanced client service. The Cúram Express Rules

environment provides the functionality necessary to support a range of rules-based business processes in Cúram-based solutions. <GEN066>

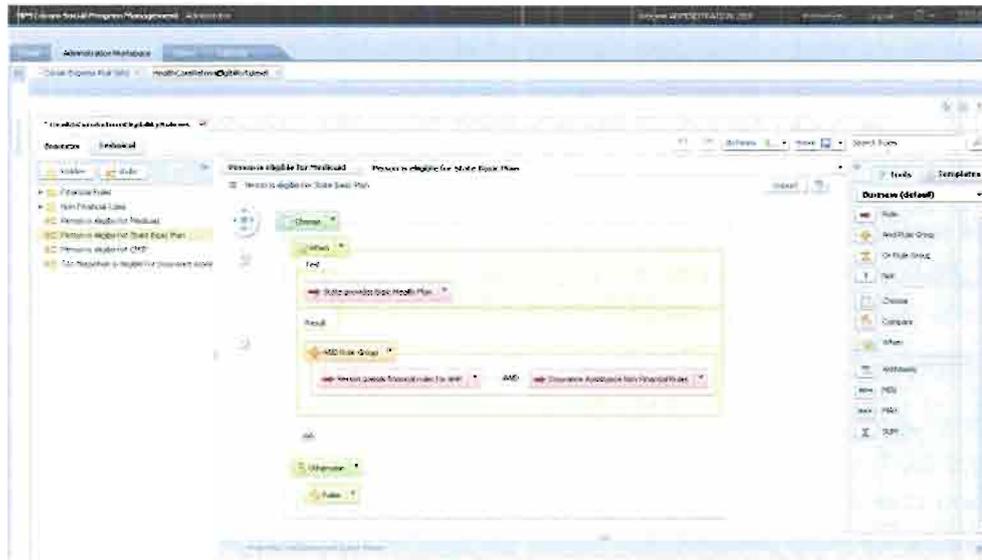

Figure IV-39: Cúram Express Rules Editor

Cúram Express Rules (CER) Environment

CER is a versatile and adaptable rules environment that supports the definition, creation, and execution of rules to support a range of business functions commonly required by social enterprise agencies. The CER environment consists of the following components.

- CER Editor – provides a user friendly tool for business analysts and developers to storyboard, design, and construct rules, and to link rules to data.
- CER Engine – executes rules on demand at runtime in order to output business-based calculations.
- Rate Administration – rates and policies in effect such as Federal Poverty Levels and Disability types.

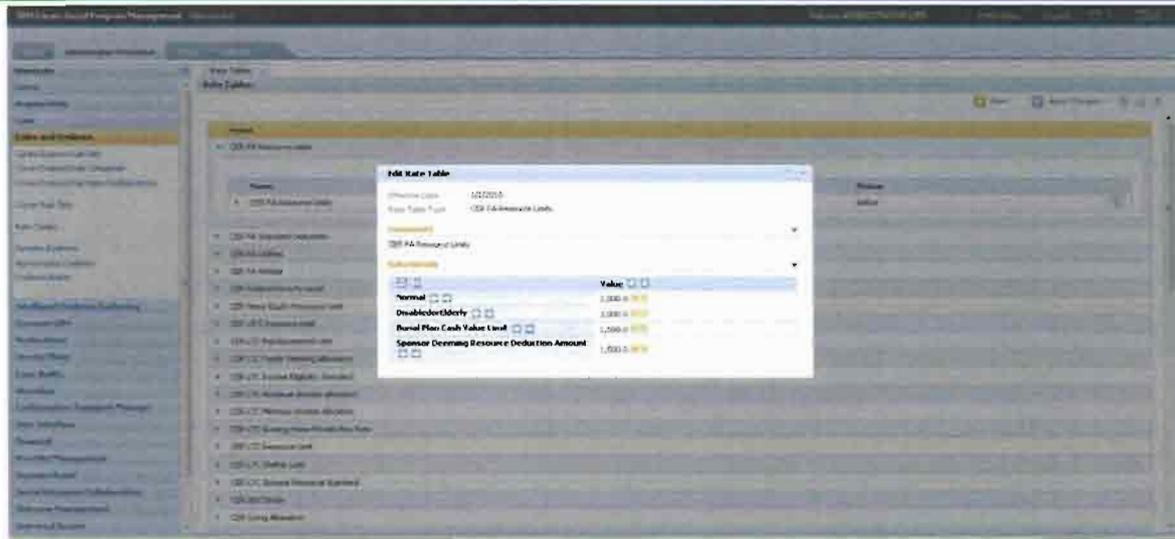

Figure IV-40: Rate Table Example

Policy Management

MLTC is responsible for the administration and oversight of multiple programs tied to state and federal funding sources, regulations and legislation. The Department is responsible for the interpretation and implementation of many complex rules associated with Medicaid programs. In addition, administrators must provide guidance to Department and affiliate organization staff to develop, support and maintain State programs. They must keep their staff abreast of all changes and confirm that changes are accurately reflected in the rules used by *SmartPro MedEE* to determine program eligibility.

Policy changes often impact rules governing eligibility. It is critical that *SmartPro MedEE*'s integrated rules engine reflect the current policy while still allowing assigned workers to accurately determine eligibility for periods prior to the policy change(s). *SmartPro MedEE* will maintain a complete history of program-specific rules each associated with a date and an effective time period. Rules, based on given time-bound constraints determine eligibility and benefit calculations. This will allow *SmartPro MedEE* to post-date activities associated with one or more criteria. Such functionality is essential for managing policies, especially those with retroactive effective dates. Application of the policy is seamless to the user. For instance, individuals authorized to determine eligibility and clients accessing *SmartPro MedEE* via the Public Self-Service portal will receive eligibility as it applies to the span of time for which they are requesting assistance. The rules engine, rules development and maintenance are discussed multiple times in this response. Within this proposal, the Functional Requirements section discusses rules and their impact on Medicaid Eligibility and Administration. Technical discussions of the integrated rules engine are available throughout the Technical Requirements section.

Policy and procedural changes may occur at a rapid rate or may be very complex. Worker aids such as the Smart Panel and Online Help features are designed to provide actionable information within the context of the user's workflow. Access to the right information at the right time assist workers through the transition as policies or processes change and also helps normalize the learning curve that often challenges new users.

The Smart Panel is optionally located on the right side of the main content of a page. The user can show or hide the panel using the arrow on the top left of the panel. It is designed to help users carry out the task or work at hand. It contains two main elements, namely the advisor and quick notes.

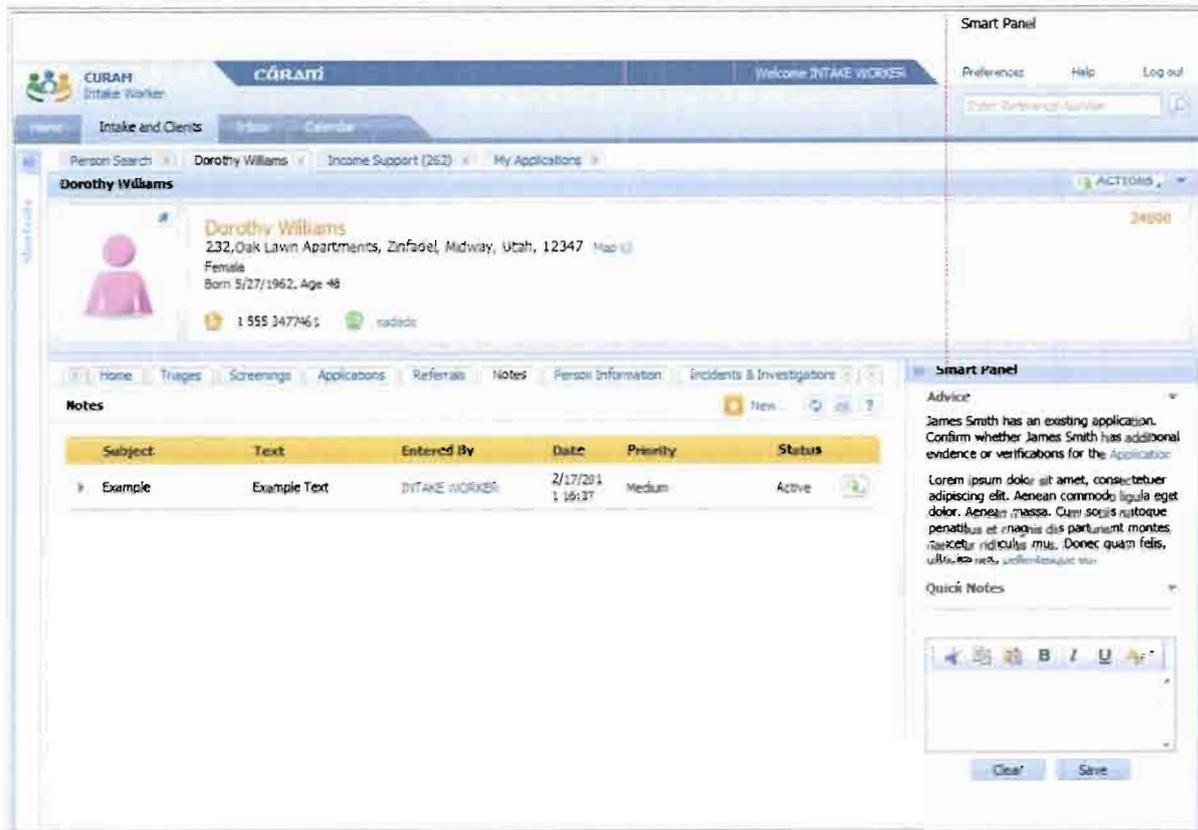

Figure IV-41: Example Page Showing Smart Panel

The advisor provides the user with context-aware recommendations and suggestions for topics or items that require their attention. It is designed to help guide the user through the process at hand. The advisor analyzes the data entered in the system, and then determines the advice that should be displayed, based on specified rules. The user can action advice by clicking on the hyperlink displayed within the advice item text. Items can be prioritized, allowing highest priority advice to be displayed first.

The quick notes feature allows users to take notes while working through the task. As the user works through pages, the quick notes feature can be constantly displayed. This allows the user to input and save notes at any stage, without having to choose another menu option or move away from the current page.

Integrated online help will also assist users as they work through tasks. For example, the worker, uncertain of the next step in the process or how current program policy applies to a situation, can use on-screen help and online documentation without leaving the screen or application. Online help will allow the users to access this documentation from a screen. So for example, a worker can access applicable, program-specific policy or legislation when processing an application or access Help to confirm the type of information or verification that is required at any point or location. Once the

Online Help information is reviewed, the user immediately returns to the screen and field from which Online Help was accessed.

The online help system is customizable and supports multiple languages. System administrators can update the Online Help by updating help files and help dialogs in the editors. The system administrator can accomplish this in their development and UAT environments, and subsequently load the updates into the production environment.

Audit

The proposed *SmartPro MedEE* is designed to track, log and maintain a comprehensive history of case transactions and activities. These activities include case activities from the time a case is created and all case updates, the entry of a case note, including additional notes entered to update or amend an original case note entry, changes in client eligibility, and the addition or removal of a household member which in turn will trigger eligibility redeterminations for all members of the household. This change in household circumstance and any changes to eligibility will be recorded both at the client and case levels. <GEN033, GEN043>

The *SmartPro MedEE* solution will also support audit processes such as those associated with Quality Control (QC) reviews focused on confirming strict adherence to program policy and to ensure that client eligibility and client benefits are accurate for a distinct period of time.

SmartPro MedEE will use the case auditing features provided by Cúram to address the Quality Control requirements in an intuitive and configurable way. Some of the capabilities Cúram will provide out-of-the-box include:

- Plan creation - the ability to create a QC plan specifying the scheduling details, the purpose of the QC review, and the selection criteria to use in generating a sample list of cases
- Automated Case Sampling - audit case selection based on a range of criteria for the purpose of carrying out case reviews
- Case assignment - automated or manual assignment of designated workers to act as QC reviewers or auditors on the sample cases; authorized users have the ability to override automated assignments
- Review management - to the tasks and activities necessary to effectively manage the information relating to QC reviews in the context of a case that includes the members, workers, providers, contracts and other data necessary for a QC review
- Review documentation - auditor's ability to complete the review, enter comments and notes at any step of the process, and the ability to document and display the QC review findings ;
- Automated notifications - automated notices to management, workers, members and/or providers of QC review events based on milestones reached or specified activities
- Search - the ability search for existing QC reviews and review plans and to view a list of assigned QC reviews and review plans
- Support for peer case reviews

Configuring QC Review Settings

The sample universe may include the entire caseload or be limited to a specific subset of clients such as those eligible for a specific program offering. The universe may also be limited to cases determined eligible or denied during that specified period.

The ability to specify the instruments and components used to carry out QC reviews will be provided through the Cúram Administration Suite application. Administrators will log into this application and configure how the audit of a particular type of case should occur. This includes the ability to identify the algorithm that should be used in generating a random sample of cases. It also allows for the selection of the queries to be available for a QC review coordinator when generating the sample of cases, as well as the “focus areas” that should be addressed by each QC reviewer assigned to participate in a review. The Coordinator’s ability to review the sample also affords the opportunity to manually remove or eliminate a case from the sample and substitute a case in its place. Customer satisfaction surveys will be managed using Survey Monkey, Enterprise Edition supporting survey initiatives with PHI/HIPAA <GEN022, RPT011>

A default algorithm is provided, as well as sample queries for use in specifying the selection criteria that can be used in the generation of a sample of cases for the purpose of QC reviews. Both the algorithm and sample queries can be customized to meet the exact needs of Nebraska’s programs. <RPT009, RPT010>

Figure IV-42: Sample Case Audit Configuration

Planning QC Reviews

Designated users known as Audit Coordinators will create a Quality Review Plan for a specific type of case. To create this plan, the Audit Coordinator will specify purpose of the review, what type of user involvement should be allowed (such as ability for designated individuals like caseworkers to provide feedback to findings or, simply view-only access to findings information), and the focus areas to be addressed. A schedule for the time period over which the audit is to take place will be defined, and a sample list of cases generated.

The list of cases may be generated either by manually selecting specific cases or through the random generation of a sample case list by the system based upon selection criteria such as Start Date, Case Status, and Case Decision, entered by the Audit Coordinator. The criteria that can be entered by the Audit Coordinator will be dependent upon how audit information for the type of case being audited was administratively configured.

Once a list of cases has been generated, the Audit Coordinator can then assign each case to either an individual Auditor or an Audit team in order to carry out the Quality Review.

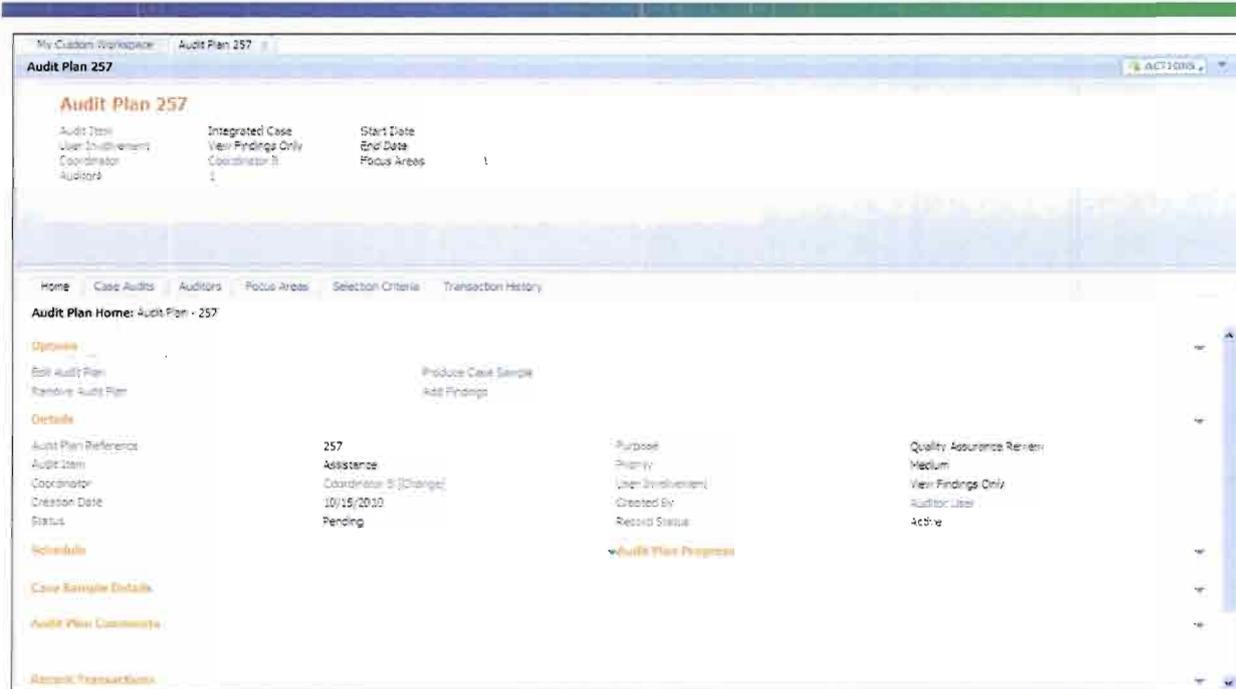

Figure IV-43: Sample Audit Plan for a QC Review

Carrying Out QC Reviews

Once a case audit has been assigned to an Auditor or Audit team, the participating Auditors can enter findings information for each focus area specified by the Audit Coordinator for each sample case. Having carried out the QC Review, each Auditor can indicate that the findings are complete. If the audit plan has been configured to allow feedback, this will result in a notification being sent to each Auditor for the purpose of providing feedback. Each participating Auditor will receive a task that provides a link to a page on which feedback comments may be entered. The Audit Coordinator can then view the feedback comments within the Case Audit Plan and update the overall findings as necessary.

Many features are provided to help both the auditors and the Audit Coordinator to participate in and manage the audit process. Case auditors are provided with a dedicated workspace to view their assigned audits and sample cases, as well as the tasks relating to these. Audit Coordinators also have a designated workspace for creating and managing multiple audit plans. Options are provided to assign one or more Auditors to an audit plan as well as options to view the history of the audit plan, the auditors involved, the focus areas and the selection criteria used. *SmartPro MedEE* will maintain a complete history of all audits completed allowing authorized users to review information and access audit details. <RTP012>

ii. *Non-Functional Requirements*

ii. Non-Functional Requirements

1. *Key Assumptions*

The Wipro/IBM team has examined the Key Assumptions list and confirms that consideration was given to all key assumptions while preparing the *SmartPro MedEE* solution.

2. *Proposal Requirements*

a. *Architecture and Policy*

Describe the proposed approach to SOA. The approach must, at a minimum, take the following topics into consideration in the details:

1. Distribution of Services;
2. Integration of Services;
3. Ease of Maintenance;
4. Administrations and Security; and
5. Support for various Protocols.

The *SmartPro MedEE* solution is based on a Service-Oriented Architecture.

- Distribution of Services is enabled by the WebSphere Service Registry and Repository (WSRR), which provides clear visibility into distributed service associations and while enabling governance across platforms of the entire services lifecycle through true end-to-end repository federation to provide multi-data center implementation of the environment.
- Interfaces between components and with external components are enabled by the IBM Integration Bus (IIB) which enables SOA standards-based communications and allows you to connect virtually any application or service over multiple protocols including SOAP, HTTP, Java Message Service (JMS) and more. <GEN018, GEN061>
- The *SmartPro MedEE* components are SOA-enabled
 - The Cúram COTS package that delivers the core eligibility and enrollment function is SOA-enabled. The Cúram toolkit allows any business function to be exposed easily as a service, generating the necessary artifacts such as WSDL. It also allows Cúram to easily consume web services.
 - The IBM InfoSphere Master Data Management product communicates with its providers and consumers via Web Services
 - IBM Cognos can provide access to its functionality via the Cognos SDK, a toolkit you use to extend and customize IBM® Cognos® reporting products as Web services.
- The Wipro/IBM design and development approach is SOA-centric in identifying and implementing services and using the SOA infrastructure to connect and orchestrate service providers and consumers.

Wipro/IBM understands that distribution of services and integration of services will provide the State with a flexible architecture to allow easier maintenance and enhancement of both the EES and those other systems with which it is integrated. Distribution and Integration are complementary notions allowing loosely-coupled services to be delivered through multiple components distributed across multiple platforms to be integrated to provide coherent business function.

The IBM WebSphere Service Registry and Repository provides SOA governance and enables Distribution of Services by tracking the lifecycle, versions, location and availability of services, while the IBM Integration Bus provides for the integration of those services. Both provide support for many industry standard protocols.

Wipro/IBM proposes an SOA-based approach in identifying, defining, designing services for the Enterprise. For EES implementation the solution will be integrated with various enterprise applications like MMIS, N-FOCUS, FFE, Federal Data Hub, State Systems, etc., via the IBM Integration Bus (IIB).

The Wipro/IBM approach classifies services into 5 different categories namely Data Service, Business Service, ESB Data Flow and transformation, Business Process Service and Business activity Monitor.

Data Service is the lowest grain of service decomposition and typically implements CRUD operations in a Database, a technical adapter configuration to integration with the system (like SAP Adapter, JDE etc) for a very specific transaction type. It can also be defined as composite data service which implements multiple fine grain data services.

The **Business Service** is the medium to coarse grain of Service decomposition. The business service implements functionalities like Data Validation, Enrichment and orchestration of multiple Data services to provide a business functionality. The business service can also orchestrate ESB Data Flow and transformation service implementation.

The **ESB Data Flow and transformation** implements service mediation, routing and transformation. The ESB implements protocol transformation, data transformation, mediation and routing of service invocation. The ESB implementation may integrate Business services with other systems or may invoke Data Services

The **Business Process Service** implements macro flows with human interaction vi UI layers. The Business Process may invoke any combination of ESB Service or Business Service, Data Service.

The **Business Activity Monitor** service implements the report of business services/Business Process implemented in the integration and business process tier.

IBM IBM Integration Bus (IIB) is the implementation of the Enterprise Service Bus for Data Service, Business Services, ESB Data Flow and Transformation service.

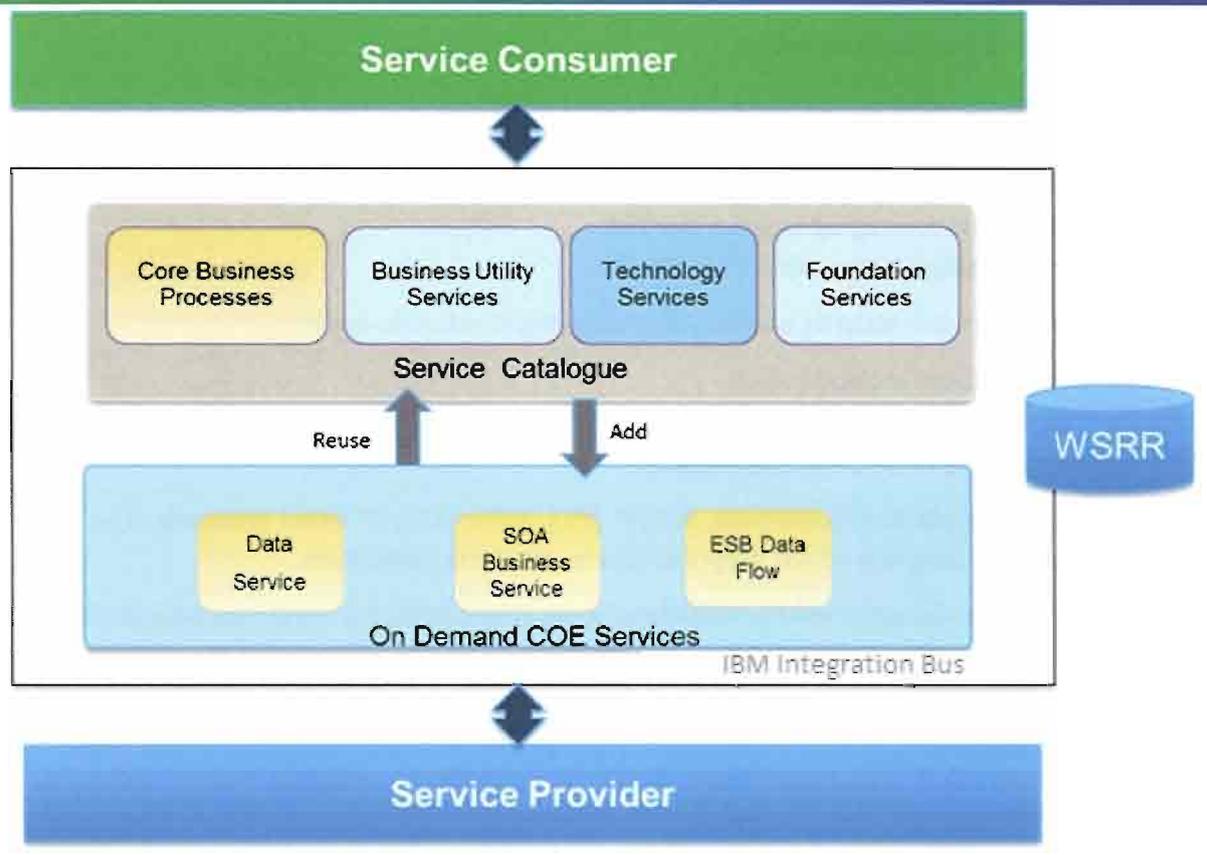

Figure IV-44: Service Mediation Pattern

Event based and real time integration will be implemented using IBM Integration Bus. The batch file transfer will be implemented using IBM Sterling Connect Direct.

Wipro/IBM plans to use a standard design pattern and framework (Service Enabler Kit), developed by Wipro/IBM to accelerate the ESB implementation approach. The Service Enabler Kit provides three component-based layered design patterns (Façade, Transformation, Mediation) to implement various common use cases for ESB implementation. This simplifies the maintenance of service. The Services will be registered in WSRR for design time discovery and run time end point identification. IBM Integration Bus includes a set of performance monitoring tools that visually portray current server throughput rates, showing various metrics such as elapsed and CPU time in ways that immediately draw attention to performance bottlenecks and spikes in demand. You can drill down into granular details, such as rates for individual connectors, and the tools enable you to correlate performance information with configuration changes so that you can quickly determine the performance impact of specific configuration changes.

The IBM Integration Bus web user interface (UI) enables you to view and manage Integration Bus resources without any additional management software. It connects to a single port on the integration node, provides a view of all deployed integration solutions, and gives you access to important operational features such as the built-in data record and replay tool.

Messaging security ensures that service integration bus users are authenticated, resources are protected by security checks, and messages are secured when they are in transit.

IIB Security covers all of the following areas:

- Authenticating and authorizing users that attempt to connect to a bus, and use its resources.
- Securing communication transports between clients and messaging engines, and between messaging engines themselves.
- Authenticating peer messaging engines in a bus.
- Protecting the message store with a user identity.

When a bus is created with bus security enabled, the following conditions apply:

- The bus requires client authentication.
- The bus enforces authorization policy.
- The bus requires use of SSL transport chains.

IIB supports various protocols like Webservice, HTTP, MQ, JMS, TCP/IP based protocols. The product also has technical adapters which supports various products integration.

The service distribution can be achieved by multi-data center implementation of the message broker environment. An implementation of the message broker using clustering will provide the distribution of services and high availability.

2. Describe the system integration approach between our solution, Interfaced Systems and any other proposed third party products. The approach must, at a minimum, provide details on the interoperability features and capabilities our proposed solution and how the EES intends to meet or exceed the Interoperability-Interface Requirements set forth in Appendix C;

The core features of our integration solution are:

- Use of the IBM Integration Broker (IIB) as standards-based Enterprise Service Bus (ESB) to provide an integration point between products within the solution such as Cúram or the Master Person Index and with external Interfaced Systems.
- Use of IBM Sterling Connect Direct to manage secure file transfer, including industry standard Secure File Transfer Protocol (SFTP) to those Interfaced Systems that require file-based interfaces. IIB and Connect Direct are integrated at the product level so they can act as a seamless, integrated integration broker.
- Use of products such as IBM Cúram that can both provide or consume standards-compliant Web Services directly.

Because all these are compliant with standard services such as WSDL, UDDI, SOAP, REST, Web Services standards including WS-Security and support secure protocols such as HTTPS.

3. Describe the approach to scalability and extensibility of the proposed EES. The approach, at a minimum, must take the following topics into consideration while providing the details:

- a) Ability to meet future growth;
- b) Configurability;
- c) Flexibility to keep up with changing technology and Regulatory needs;
- d) Ease of maintenance.

SmartPro MedEE is architected following modern application precepts, such as Service Oriented Architecture, rules engine abstracted outside of code, and hardware/environmental virtualization. It is also built upon an extremely scalable hardware/software appliance, the PureApp server. Initially,

SmartPro MedEE (all of its environments) is being implemented on two 64-processor PureApp servers: one for the primary data center, a second for the secondary (DRR) site. Without changing out boxes, each server can be upgraded in-place to nearly 10 times its initial compute capacity and memory configurations, providing nearly unlimited potential for future growth.

The SOA architecture provides for interoperability, scalability and, by avoiding single points of failure provides for high availability and resilience. It is fully compliant with the State’s non-functional requirements as detailed in the traceability matrix. The architecture also aligns to the CMS Seven Conditions and Standards guidelines, as outlined in the table below.

Table IV-8: *SmartPro MedEE* Aligns with CMS’ Seven Conditions and Standards

Condition	Requirement	<i>SmartPro MedEE</i>
Modularity Standard	<ul style="list-style-type: none"> Open interfaces using web services Business rules external to the program code Formal SDLC Open and reusable systems architecture Componentized into business processes Built on SOA principles Multiple access channels 	<p>SmartPro MedEE is a modular, component-based application, which easily interfaces (via web services or other means) with other federal, state and data trading partner systems.</p> <p>SmartPro MedEE is rules-based, uses a formal SDLC and is built on SOA principles.</p> <p>Members and staff are able to access the system via mobile devices, email, and web applications, as well as through traditional call centers.</p>
MITA Condition	<ul style="list-style-type: none"> MITA Alignment Business Workflows 	Aligns with MITA Business Architecture, Information Architecture and Technical Architecture to assist DSS in their MITA maturity alignment
Industry Standards Condition	<ul style="list-style-type: none"> HIPAA Compliant ADA Compliant Keep system current Risk Planning Systems Development and Testing Methodology 	SmartPro MedEE and the EDI platform are HIPAA and Section 508-compliant. The open architecture allows for decreased maintenance costs. The SDLC and Project Management methodologies are highly mature, with many successful implementations
Leverage Condition	<ul style="list-style-type: none"> Sharing artifacts between states Facilitates identification and reuse of services within the State National cloud-based repository for modular features Open Source and cloud-based products Transition and Retirement Plans 	Rules and business processes may be leveraged for use in other states, as needed. The technical platform is COTS-based and can be purchased by other states, on the open market. In the future, the technology can be deployed in the cloud, and supports multi-tenancy.

Condition	Requirement	SmartPro MedEE
Business Results Condition	Use of Business Processes and associated KPIs to drive business results Performance Dashboard to monitor and continuously improve service delivery	The <i>SmartPro MedEE</i> solution provides for an exceptional degree of automation. Operational reports are provided to ensure system processing integrity and continuous improvement. Consumer portals support on-line transaction processing to eliminate manual processes. Wipro/IBM's solution is aligned with MITA business processes and supports real-time monitoring of associated KPIs.
Reporting Condition	Provides automated reports on demand, to authorized requesters	The <i>SmartPro MedEE</i> solution provides for automated reports, as needed, through 3rd party reporting tools, included those produced by our proposed Cognos reporting tool. Additionally, IBM's Sterling Commerce File Gateway product automates and manages schedule interface interactions with CMS and other data trading partners.
Interoperability Condition	Loosely coupled, component-based architecture	<i>SmartPro MedEE</i> is architected on open solutions that provide for exposed interfaces and easy integration with other components, modules and systems including the federal data hub, eligibility systems, Medicaid plans and other parties.

SmartPro MedEE is built upon IBM's PureApp server, a fully integrated web and cloud-ready hardware and software appliance. This simplified infrastructure approach provides the State with greater flexibility, improved maintainability, and an environment that adapts quickly to your changing business needs. PureApp encompasses highly scalable hardware (IBM Power+ series), Operating System (AIX), Database (DB2 Enterprise), Application Server (WebSphere ND), virtualization, and monitoring/management in a single pre-integrated and certified whole. BY implementing pre-defined and certified patterns e.g. "3-Tier Web Application" or "Cognos Business Intelligence", PureApp servers can make integrated and certified application environments available within less than a day from the delivery of the box, and supports configuration of virtualized environments within moments. This level of integration eliminates a large element of people time, cost, and risk normally associated with preparing the technical environments so that application teams can begin their work.

4. Describe the approach to meet Performance Standards. The approach must, at a minimum, provide details on how the EES intends to meet or exceed the Performance Requirements set forth in Appendix C;

The Wipro/IBM team uses our project management methodology to identify and track alignment to the requirements set for in Appendix C. Requirements from Appendix C are uploaded into the Using Rational Team Concert (RTC) repository. During requirements validation sessions, each of these requirements is confirmed and any adjustments to the requirement are managed within RTC.

These requirements are then tracked and managed during all remaining phases of the SDLC, from requirements gathering, to development, testing and implementation. These requirements are easily summarized, displayed, and managed with dashboards, as described in the figure below.

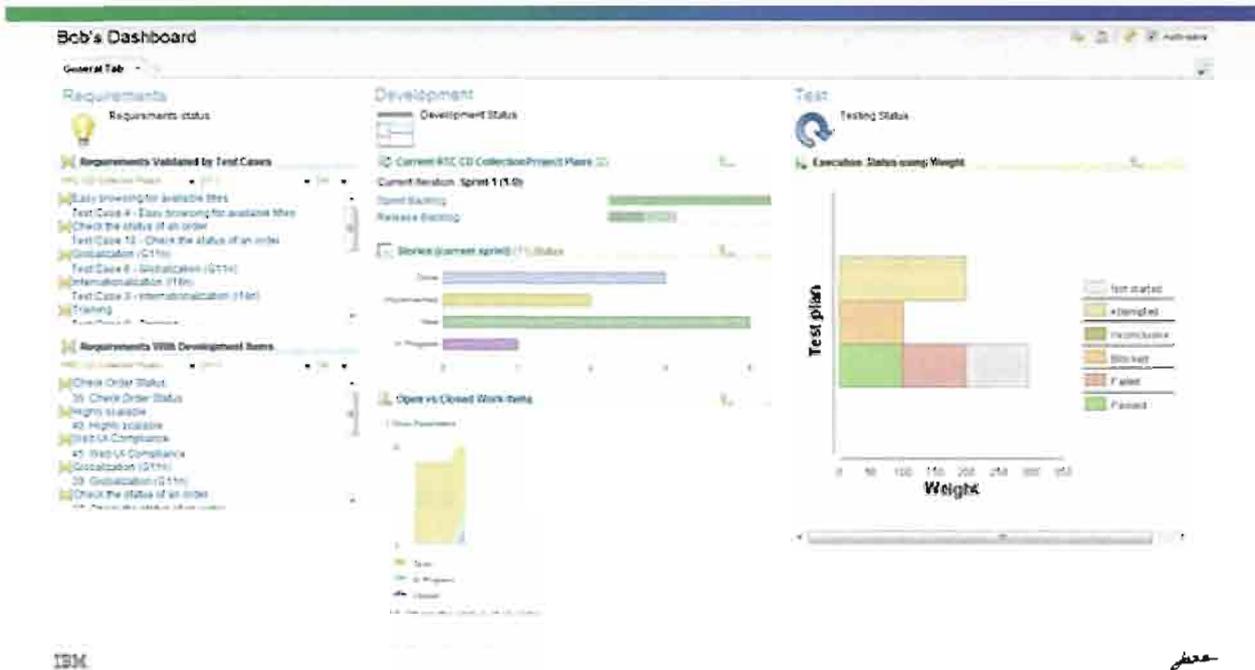

Figure IV-45: Example of Real-Time End-to-End Requirements Management Dashboard

Using this approach to non-functional requirements management, the Wipro/IBM team will meet or exceed the Performance Management Requirements as described in Appendix C.

Once the requirements have been identify, validated, met and implemented, the Wipro/IBM team provides the State with IBM Cognos reporting capabilities, including dashboard reporting, to quickly and easily identify operational performance metrics, as portrayed in the diagram below.

Figure IV-46: Performance Reporting in Cognos

5. Describe the approach for the EES to adhere to or enable State and federal regulations;

Adherence to State and federal regulations is accomplished using SOA-based technologies and fully featured reporting capabilities. With regards to the MITA Business, Technical and Information Architecture guidelines, the *SmartPro MedEE* EES uses COTS tools that are rules and workflow-enabled. Our IBM Cognos reporting tool provides extensive capabilities to manage and analyze the program operations, and provide the information necessary to continue to meet the needs of Nebraskans, State and federal staff and other stakeholders.

The Wipro/IBM team is aware of and tracks to multiple state and federal requirements including.

- Enhanced Funding Requirements: Seven Conditions and Standards – Medicaid IT Supplement (MITS-11-01-v1.0)
- CMS MITA 3.0 Framework guidelines
- HIPAA Standards, including Privacy and Security, Code Set and Transaction standards
- Federal and State security standards

The Wipro/IBM team is represented on many national committees and is actively participating in the setting of standards at the national level. In addition, Wipro/IBM is proposing an advisory group that meets regularly with State MLTC executives to discuss the overall vision of the Department and how the *SmartPro MedEE* solution continues to evolve to meet the needs of the Department. <GEN060>

6. Describe the approach for the proposed EES to meet Audit and Compliance requirements;

The Wipro/IBM approach to meeting audit and compliance requirements is accomplished primarily using our *SmartPro MedEE* Project Management Methodology to identify, validate and track requirements throughout the life cycle of the engagement. Our response to Question 4 above describes how we will meet the non-functional requirements in Appendix C. This approach will also be used to meet the functional requirements (Appendix B), as well as additional Audit and Compliance requirements.

Specific to Audit and Compliance requirements, our approach is first to validate that the State and Wipro/IBM teams have a common understanding of all requirements, and then configure the applications to support these requirements. Throughout the entire development lifecycle, we report on the status of these requirements.

IBM Cúram and Master Data Management both have highly configurable audit capabilities so that business transactions and database-level transactions can be enabled for audit, for either read or update operations.

The following information is captured:

- Date and time - The date and time of the transaction.
- User ID - The ID of the user who invoked the transaction.
- Table name - The name of the database table which was modified.
- Program name - The FID of the function which invoked the transaction.
- Transaction type - Indicates whether the transaction was online / batch / deferred / etc.
- Key info - The key which was provided to this operation.
- Details of changed data

In addition, IBM Cúram has a mechanism to select cases for audit based on specifying selection criteria within which random cases are selected for audit.

7. Describe the design approach and the characteristics of the user interface for the EES. The EES must be designed to utilize a browser based interface that can provide feature rich applications that can be updated over the Wide Area Network and the Internet, and should deliver a consistent user experience to participants, Department staff, contractors, and partners.

The Wipro/IBM *SmartPro MedEE* design approach is SOA-based to facilitate interoperability between and within the MLTC enterprise. Built on this strong SOA foundation, the user interface is 100% web-based, providing for a consistent and intuitive experience for all users, including the Department staff, contractors and partners.

As portrayed in the screen print below, the user interface is designed based on the latest trends in web page usability and features large, easy-to-read and click icons and logically placed navigation architecture, using left column business process navigation, tab-based business workflow navigation and top row administrative help and navigation.

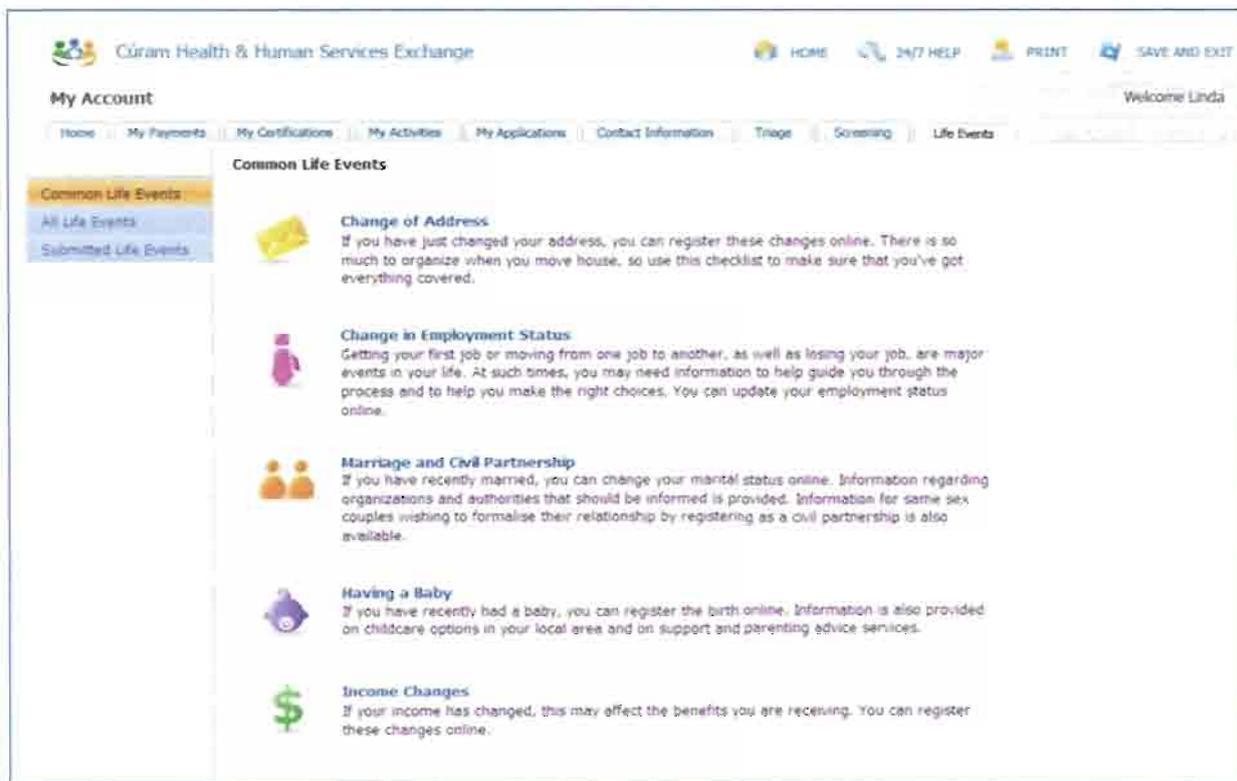

Figure IV-47: Common Life Events

b. System Administration and Support

Within the System Administration and Support section, we provide an overview of the tools, procedures, and overarching processes that Wipro/IBM will bring to bear with *SmartPro MedEE*. While not exclusively “data center” tools and processes, this section is predominately

The IBM PureApp “system in a box” with integrated PureSystems Manager provides huge savings in Systems Administration and Support by automating traditionally manual administration

about how the *SmartPro MedEE* solution is monitored and administered within the data center. It is worth noting that these tools and procedures are brought into play early during the commissioning of the various technical elements of *SmartPro MedEE* development and implementation, and then carry on throughout Operations and Management.

System Administration Tools and Procedures for O&M

i. Describe the system administration tools and procedures that will be delivered for the ongoing support and maintenance, including customization of the EES.

SmartPro MedEE is comprised of three primary application components: IBM Cúram for Eligibility and Enrollment; Cognos for Business Intelligence; and LifeRay for general Portal functionality. These primary applications execute on standard tools and middleware components such as IBM WebSphere and DB2. All components will be hosted within Wipro's Omaha, Nebraska and Tempe, Arizona data centers, executing on IBM PureApplication integrated server appliances.

As a guiding principle, *SmartPro MedEE* minimizes the number of System Administration Tools during Operations and Maintenance, to increase the effectiveness of the support team and to reduce overall costs. The use of IBM's PureApplication server appliance, specifically PureApp's PureSystems Manager (PSM) as the core tool for technical system management is central to successfully executing this strategy. PSM provides a single unified tool environment for Application Management, Web services Management, Systems Management, Performance Monitoring, and Workload Management.

At the Enterprise Data Center Level, Wipro utilizes InfoPac, a Wipro implementation of Computer Associates Service Desk Manager package to consolidate alert events from the PureApplication server environment and from the network comprised of routers, load-balancers, and firewalls. InfoPac provides both the data center staff and designated State representatives (through an Internet accessible portal) a consolidated view of *SmartPro MedEE*'s status. InfoPac also implements Wipro's trouble ticket automation and management, both for tickets created automatically due to internally generated system alerts, and human created tickets opened by State or Wipro/IBM staff.

Lastly, during O&M, Wipro/IBM continues to support the same System Development Lifecycle (SDLC) tools and procedures that it utilized jointly with the State during DDI. Specifically, Change Management, Issue and Risk Management, Requirements Management, Quality Management, SDLC, and Communications Management remain fundamentally unchanged, though additional production oriented information e.g. Service Level Agreement (SLA) reporting is incorporated once O&M is entered.

Overall Management Framework and Related Tools

ii. Describe the proposed overall management framework, including proposed tools for:

- a) Application Management and Monitoring;
- b) Web Services Management;
- c) Systems Management and Monitoring;
- g) Performance Monitoring; and,
- j) Workload Management.

The heart of **SmartPro MedEE**'s application management and monitoring is provided by the integrated management environment of IBM's PureApplication server appliance. PureApp implements a compelling vision of integrated management combining Deployment, Application and System Monitoring, Lifecycle Management, Workload Management, and Infrastructure Management. Such monitoring and management capabilities typically require the implementation and integration of numerous independent tools, resulting in increased overall costs and extended start-up times to deploy and initially setup complex environment.

PureApp shortcuts this process by providing a fully integrated management and monitoring environment out-of-the-box, up to and including the application management layer for multi-tier web applications such as **SmartPro MedEE**. In Wipro/IBM's **SmartPro MedEE** solution, PureApp in turn forwards significant monitoring and management events to the Wipro's InfoPac, our Enterprise event monitoring and incident management system via the industry standard SNMP protocol.

At the heart of PureApp's system management capabilities is PureSystems Manager (PSM), which represents over 1,000,000 staff hours of development by IBM. Out-of-the-box, PureApp with PSM supports full automation of:

- **Deployment**

Patterns, re-usable and configurable definitions of environments and workloads, are the core of the PureApp environment. Patterns include a mix of application patterns supplied out-of-the-box (3-tier web application, or Business Intelligence), and system patterns (scripting and customization of basic OOTB patterns). Patterns allow deployment in moments of fully integrated and certified environments that would otherwise require weeks to months of environmental development, configuration, and testing.

Patterns allow deployment in moments of environments that would otherwise require weeks to months of effort

- **Virtual Application Patterns**

Integrated environments, including OS, Application Servers, DB, and System Monitoring, deployed on command OOTB. Self-managing and self-scaling according to policies.

- **Virtual System Patterns**

Customizable and scripted Patterns that build upon basic OOTB configurations.

- **Individual Virtual Appliances / Images**

Create customized pre-configured images, deploy upon command.

- **Monitoring**

- **Application Server and DB specific monitoring for all supporting VMs**

Out-of-the-Box monitoring and management reduces deployment effort by up to several weeks per VM Environment.

- **Operating System (AIX), CPU, Memory Utilization etc. for all VMs**

Based on configured policies, can automatically load-balance and adjust deployed physical resources to meet performance goals.

- **SNMP Integration to pass alerts upstream to Enterprise Event Monitoring**
Easy, industry-standard integration with the Enterprise Event Monitoring and Incident Management environments of the Data Center.
- **Graphical/Dashboard presentation with drill-down**
High-touch, easy to use management interface.
- **Lifecycle**
 - **Integrated fixes/patches for entire PureApp environment e.g. OS, DB2, WebSphere all at once**
Environment is considered as a whole, rather than managed as individual components, thereby reducing time and risk.
 - **Automated recovery from VM failures**
Configuration and management of VM's for automated failover.
 - **Automatic Workload Scaling based on Policy**
Within defined parameters according to configurable policy, adjust VM physical resources, scaling horizontally to meet goals.
 - **License Entitlement Management**
Manage license entitlements in real-time, including both soft and hard limit models i.e. allow license overages or prevent license overage.
- **General Management**
 - **Single Tool encompasses Network, storage, Compute, and Virtualization**
Monitor and Manage from a single view of the PureApp environment.
 - **Prioritization of Compute, Network, and I/O resources applied to Workloads / Environments i.e. Production, QA, Sandbox...**
Provides easy and effective management of *SmartPro MedEE's* performance across the mix of environments.
 - **Centralized logging**
One consolidated view of the PureApp environment simplifies management, rather than requiring expert knowledge of many distinct tools and formats.
- **Network**
 - **VLAN Creation / Management**
Virtual LANs separate network traffic to enforce security policy i.e. Production from Non-Production network traffic.
 - **Assign IP Addresses / VLANs to Deployed VMs**
VMs and environments are easily configured to map to desired IP addresses and VLAN configurations.
 - **Separate Management and Traffic for VMs using VLANS and Virtual NICs**
Implements firewall-enforced separation of components, such as placement of Production Web Servers into the "DMZ", while Application and DB Servers of the same Environment execute in the "Secure Zone".
- **Compute Management**

- **Automated re-balancing and optimization of VMs during scheduled downtime or on compute node overload**
Dynamically allocate additional computing resources according to configured policy e.g. “If this VM exceeds 80% of allocated CPU capacity, add additional processors up to 4 CPU cores...”
- **Automated placement of location for VMs, based on entire system state**
Within configured policy, uses “now” information to optimize performance of critical i.e. Production environments, as opposed to after-the-fact tuning decisions.
- **Storage**
 - **Create LUNs and File Systems, provision, attach to VMs**
Integrated Storage Management within the PureApp box, managing storage capacity allocated to individual VMs and Environments while maintaining security policy and data separation.

Monitoring

Wipro/IBM monitors system performance of processors and peripheral devices using a variety of products to track response times over a range of intervals, and to examine response time summaries of individual logical units of work of any period thought to have a performance problem. *SmartPro MedEE* uses IBM’s PureSystems Manager (PSM), coupled with ITCAM for Applications, to monitor attributes ranging from low level technical information such as CPU utilization, through subsystem and application health, and up to application response time metrics. Using SNMP, these tools forward salient information upstream to the Enterprise Data Center monitoring tool.

Measurements

Wipro/IBM collects statistics of historical system data – measured over regular intervals – in order to establish a baseline of system performance. The baseline statistics are used to measure the differences in system performance after tuning implementation.

Gradual or significant changes in key performance indicators are recorded and an explanation regarding the cause of each change is documented. The purpose of threshold alerts is to notify Wipro/IBM personnel prior to a shortage of resources in a client’s system.

System Adjustments

Predefined corrective tasks are automatically initiated to relieve resource shortages when a threshold alert occurs. While Wipro/IBM processes include high-level human intervention in all cases, *SmartPro MedEE*’s use of the PureApplication server and its PSM module directly and dynamically automate many of the performance tuning tasks in real-time, without requiring human intervention, and without waiting.

Monitoring and subsequent adjustments normally performed by PSM, backed by Wipro/IBM staff, include:

- Processor, memory, I/O subsystems and storage adjustment
- Alert and threshold setting revision
- System priority amendment

- Processor, memory, I/O subsystems, and storage performance measurement analysis

Performance Tuning

Tuning system performance involves the monitoring of, measurement of, and adjustments to the various components of the system to improve its overall performance and availability. The goal of performance tuning is to increase the throughput and efficiency of the processor, memory, and input/output (I/O) subsystems in order to accommodate the activity and workload requested of the system.

Following configured policy and within constraints defined by Wipro/IBM, PSM automatically performs a significant percentage of resource tuning and optimization in real-time. For example, extending a virtual machine's physical core capacity if virtual CPU loading exceeds pre-defined thresholds is an out-of-the-box PureApplication capability implemented by *SmartPro MedEE*.

d) Event Management:

Event Recognition and Management will be provided to restore normal service operations as quickly as possible to minimize the impact on business operations, thus ensuring the best possible levels of service quality and availability are maintained. Interfacing to external quality management systems is accomplished via *SmartPro MedEE* Enterprise Services Bus, adding an additional layer of reporting and analysis to the enterprise. <GEN020>

Problem management will be provided to minimize the adverse impact of incidents and problems on business caused by errors within the IT infrastructure and to prevent recurrence of incidents related to these errors.

Physical and logical problems use the same problem management procedure within Wipro, pictured in Figure IV-48:

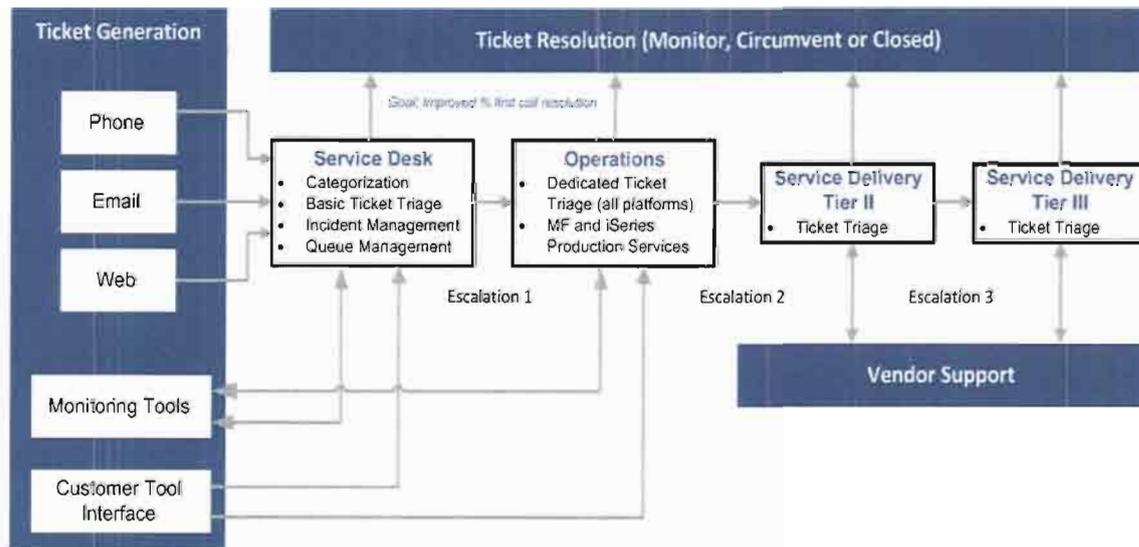

Figure IV-48: Wipro's Ticket Escalation Process

Any chronic or recurring problem initializes Wipro's service improvement process to correct a deficiency in our service, when it is not reaching expected service levels. When a deficiency appears

requiring actions beyond our problem management process, a team of Wipro employees with appropriate skills is convened to develop a service improvement plan. Once the plan is developed, it is presented to the State of Nebraska and internal Wipro/IBM management for approval. The plan is implemented along with appropriate measures.

Results from the plan implementation are compared to service levels – this process is repeated until service levels are met.

Wipro is associated with industry groups and standards such as the Quality Assurance Institute (QAI) and the Information Technology Infrastructure Library (ITIL) ensuring our practices are in-line with industry standard “best practices”. These associations also assist us when implementing new procedures and practices as needed.

Wipro focuses on continuous service improvement (CSI) to correctly track the appropriate key performance indicators along with resolving issues effectively. Our internal service delivery process ensuring operations activities are optimized.

Wipro’s Continuous Service Improvement Vision

Detailed post incident reports (PIR) are published for all Severity 1 problems to document root cause and correction actions taken to resolve the problems. The information gathered during a particular corrective process is used to assist the staff in resolution of future similar issues.

Wipro informs the State of Nebraska via primary, secondary and/or tertiary contacts previously established by the State in the contact system. Specific callout procedures are established per State requirements. Contacts are made whenever Severity 1 or 2 network faults or performance issues arise.

Continuous service improvement commitments are not intended to be agreements or contracts in the legal sense, but are intended to provide a formal process by which service problems are addressed and resolved. These commitment agreements are formalized between Wipro and a specific State of Nebraska representative.

Once Wipro/IBM technical organizations have the opportunity to thoroughly investigate a problem, a meeting is established with appropriate State personnel to discuss and develop solutions.

Event Recognition

As part of Wipro security policy all servers will have Anti-Virus software installed to protect from infections such as virus, worms etc.; and will be updated with latest signatures from the Anti-Virus server on daily basis. All servers and network devices are updated with the latest security patches and are monitored for availability of any security patches using the patch management infrastructure. Role based access will be provisioned for access to the management console with audit trails. All servers and security devices will be monitored real time for security events and alerts will be generated on detection of any security violations.

To collect audit logs from in-scope log sources Wipro deploys a local instance of Security Information and Event Management tool at the Omaha Data Center. This appliance will collect, store, and correlate audit logs from the production servers, firewalls, intrusion detection systems and other security devices deployed in the IT environment, and generate alerts on security events. Wipro

will also provide an “Event Explorer” software module for enhanced data mining, investigation support and reporting capabilities.

Reporting and Communication

- Wipro/IBM will provide a portal to enable a comprehensive reporting framework that includes incident details , Daily Monitoring Reports, Weekly Monitoring Reports, and Monthly Monitoring Reports
- Enterprise Dashboards will be provided to view all the Alerts spread across the infrastructure
- Role based access for relevant Reports, Views and Alerts will be provided to the Security Administrator, Security Manager, CISCO, etc.
- Device level reports can be generated from the portal
- Secure access to download reports (in CSV, pdf or html formats) will be provided.

Wipro SOC operations provides reports on a daily/weekly/monthly/quarterly/annual basis. Other reports can be created based on incidents/events or as part of vulnerability alert/advisories.

Table IV-9 lists typical reports generated for a customer:

Table IV-9: Typical Security and Operations Reports

Reporting List	Daily	Weekly	Monthly	Ad hoc
Security Event Reports				
Event Count Reports (based on Attacker, Severity, Target Port, Asset Priority, Device)		✓		
Events Based on Asset Group Report		✓		
Event Summary Report	✓			
Event Trend Chart Report		✓	✓	
Top 10 Security Reports (Attacks, Attackers, Targets, Events)		✓	✓	
Compliance Report (authorized change)			✓	
Vulnerability Reports				
Exposed Vulnerability Report			✓	
Asset Group Vulnerabilities Report			✓	
Critical System Vulnerabilities Report			✓	
Case Reports				
All Case Reports		✓		
Case Chart Report		✓	✓	
Operational Impact Chart Report		✓		✓
Cases Today Report	✓			
Custom Reports				
Delta Chart Attacks by Business Unit Report				✓
Alerts and Advisories Report (prioritized vulnerability)		✓	✓	

Reporting List	Daily	Weekly	Monthly	Ad hoc
Service Level Agreement and Measurement Report			✓	

These reports will be available to the State of Nebraska through the Wipro SOC Portal, as shown below; moreover, these reports will be generated and exported in three different formats: PDF, CSV and HTML.

The portal will be accessible to the State of Nebraska on a 24x7 basis with adequate role based access control.

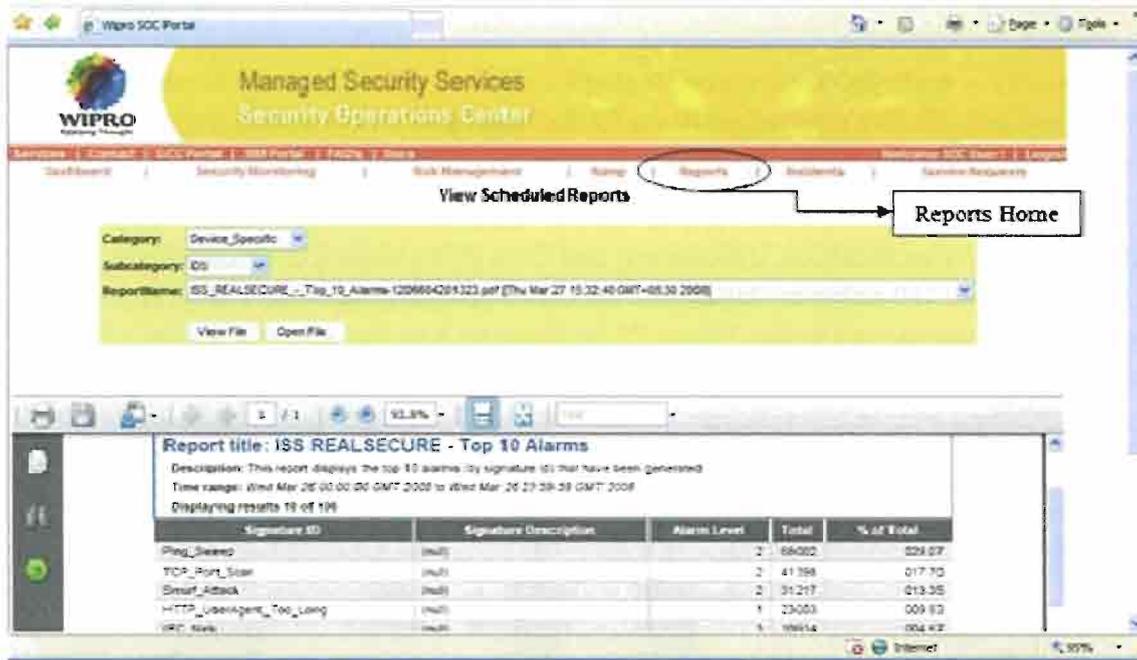

Figure IV-49: Wipro Security Operations Center Portal

Reports will be created by security operators and reviewed by security analysts or other senior SOC staff; this will provide accuracy and a review mechanism of all reported data.

PREVENTION: Wipro data centers are based on fault tolerant engineering to provide non-stop operations. In addition to these design preventive measures, data center sites are located away from industrial areas, airports, railways, and interstate highways. Most site locations have no documented earthquake or tornado activity.

CONTINUANCE OF SERVICE: Wipro will assist the State of Nebraska in the event of a disaster at a Wipro data center. Specific recovery services provided by Wipro include (but are not limited to):

- Shipment of tapes to the *SmartPro MedEE* disaster recovery location in Tempe Arizona
- Management and coordination of recovery operations
- Provisioning of appropriate technical resources during the recovery process

f) Network Management and Monitoring;

Wipro Data Center Services network management provides and manages network infrastructure in support of hosted environments. Wipro architected and operates a leading edge and cost efficient shared network infrastructure in its data centers for the benefit of its clients. Wipro also architects and manages custom network environments in the Wipro data centers and at client locations to address specific client network requirements. Wipro Data Center Services network management provides value through:

- Economies of scale via leveraged infrastructure.
- Risk mitigation of network intrusions through a comprehensive security model managed on all network environments.
- Predictability of costs and performance through a highly architected environment providing an efficient and effective network platform for the hosting of server environments.
- Flexibility to architect and operate custom network, security, and voice platforms when client requirements dictate.

Wipro Data Center Services backbone, datacenters, and Core POPs located in carrier neutral facilities provide for over 100 different carriers and telecommunications providers to facilitate interconnection with customer networks. Figure IV-50 diagrams a typical network design, as will be documented for *SmartPro MedEE*.

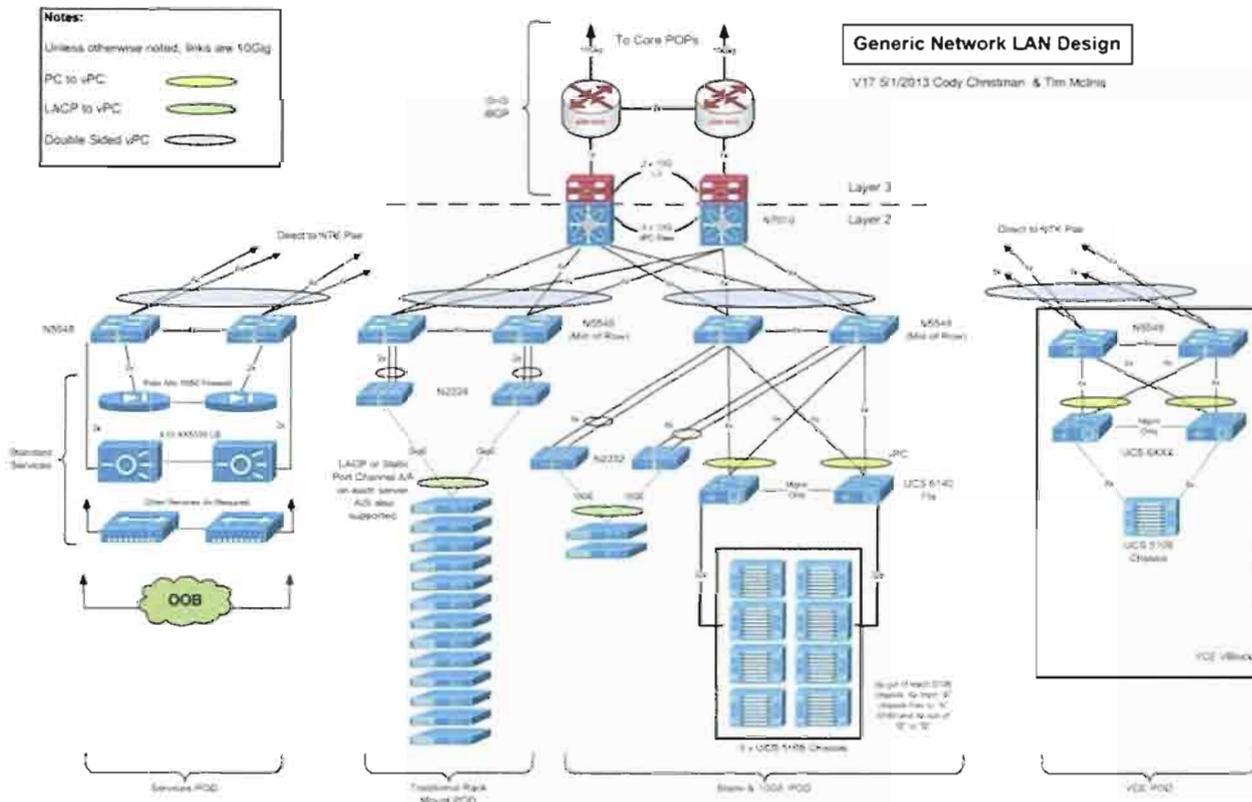

Figure IV-50: Example Network LAN Design

Figure IV-51 pictures a typical Customer Network Logical View as will be documented for *SmartPro MedEE*.

Wipro Data Center Services Datacenter LAN 09/2012

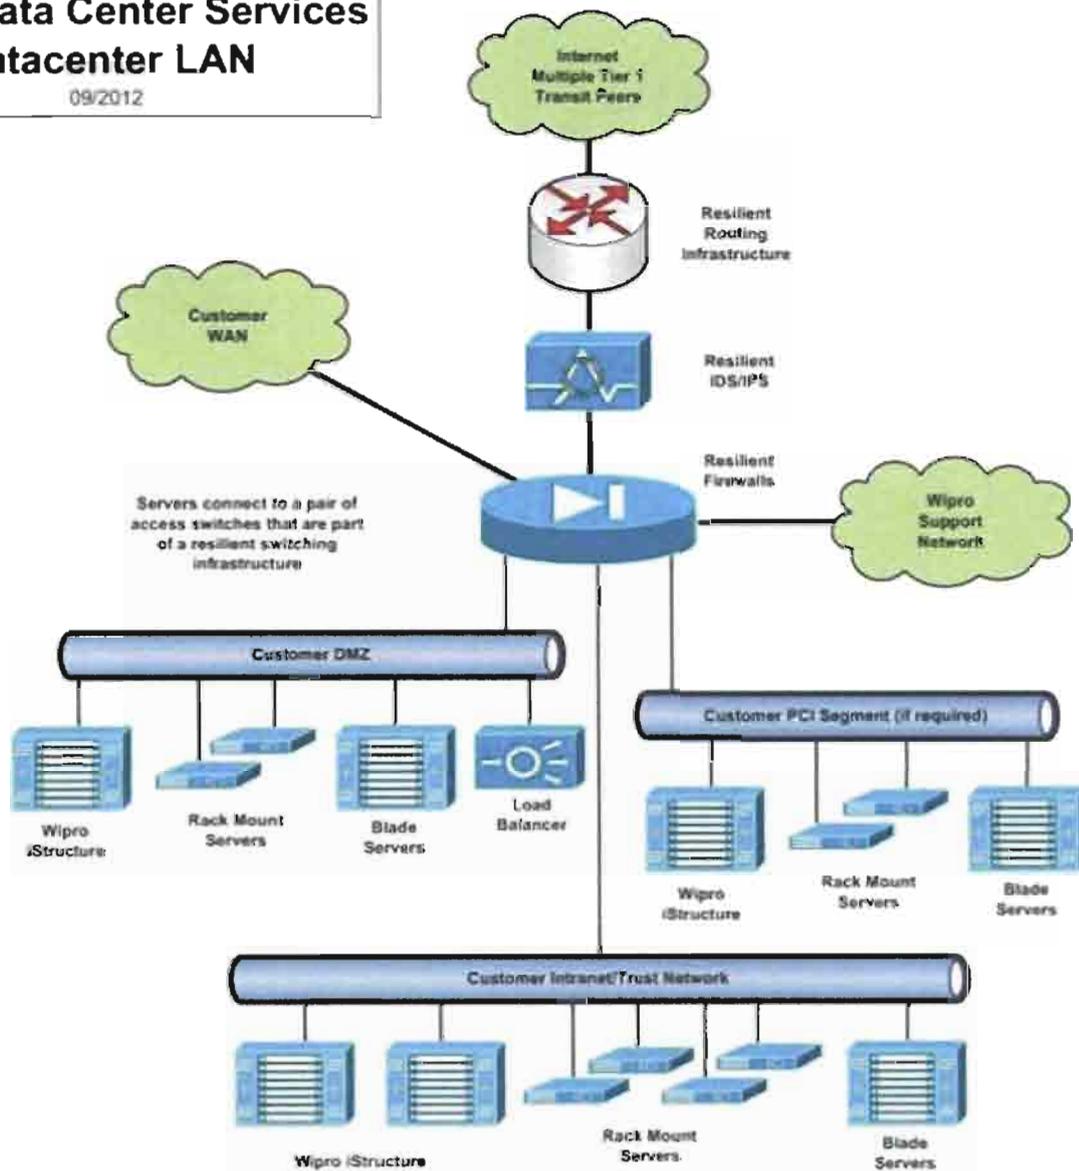

Figure IV-51: Logical View of a Typical Customer Network

Figure IV-52 diagrams Wipro’s Wide Area Network. In this picture, our Omaha Nebraska data center will host the production application during normal operations, plus several of its supporting environments. Our Tempe Arizona data center will host the remainder of the supporting environments and receive and apply the near real-time database logs from the production system during normal operations. If the primary Omaha center is lost, Tempe will take over as the Disaster Recovery Hosting Site. Conversely, if Tempe is lost during normal operations, Omaha can take over and host Tempe’s supplemental environments, with reduced capacity.

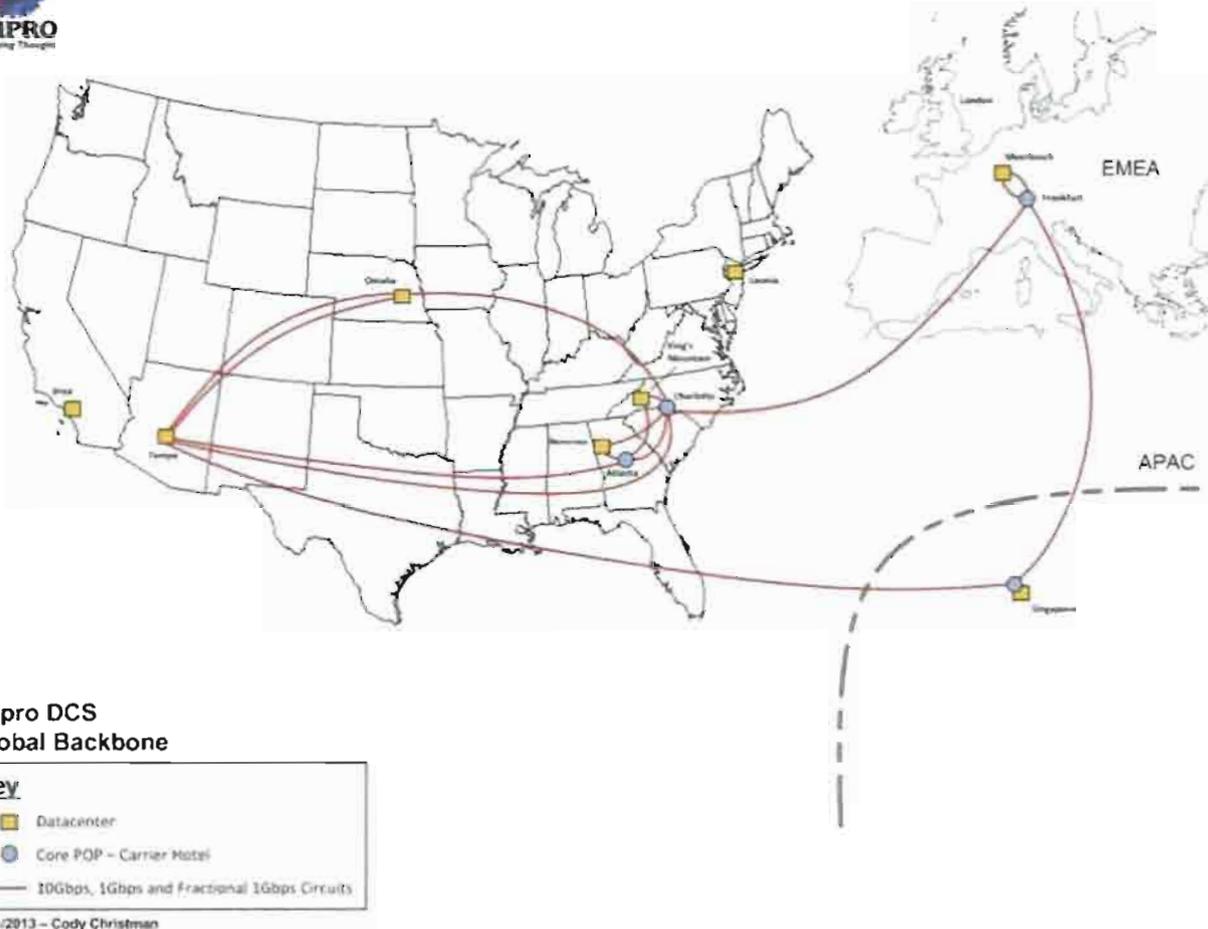

Figure IV-52: Wipro WAN Diagram

i) **Print Prioritization and Management; and**

Print jobs are broken into three categories:

1. Production (scheduled) jobs from Cúram’s Notice Engine (Eligibility and Enrollment Notifications)
2. Production (scheduled) jobs from Cognos (mainstream reporting/BI reporting), LifeRay (Portal), and Data Center Management e.g. SLA reporting
3. Ad-hoc, on-demand reporting from Cognos BI

Production/Scheduled jobs, categories 1 and 2, are created and managed by IBM’s SmartCloud Workload Automation tool. In the first case, Cúram Notices, the job stream creates one or more files containing print-ready data, which is then securely forwarded to the State’s Print and Mailing Center for printing and disbursement by the State. In the second category, the job steps will similarly create print-ready files, which may then be either securely forwarded to the State for physical rendering, securely retrieved by State initiated file transfers, or retained for ad-hoc display by authorized users via their browser through the Portal as determined during requirements analysis.

Category 3 print jobs, ad-hoc reporting, are executed on-demand by authorized users connecting through the Portal, and the results either displayed immediately, stored in an accessible file directly on the user's machine, or stored for later retrieval and potentially shared retrieval within the Portal.

Category 1 jobs, created by the Cúram Notice Engine, are run daily during off-hours within the Production Environment, on virtualized resources dedicated to the Cúram Application. Standard PureApplication automated performance management ensures that appropriate prioritization is given to competing workloads.

While executing with the same Production Environment, the LifeRay Portal and Cognos Business Intelligence components execute within their own series of dedicated and tuned Virtual Machines backed by dedicated physical resources. Whether scheduled or ad-hoc, these types of reporting are also performance managed by the automated management capabilities of the PureApplication server appliance, tuned to their expected performance profiles.

Tool Inventory

Please refer to response in the section titled Third-Party Off-The-Shelf Management Tools below: Table IV-10 documents the suite of tools that will be utilized to monitor and manage the overall technical environment of *SmartPro MedEE*.

e) Identity and Access Management;

Identity Management, the process of identifying and authenticating users of *SmartPro MedEE*, is based on two core directories. For State employees and their agents, the State's Microsoft AD will be used as the single source of Identity and Authentication truth. For citizen beneficiaries, the Cúram application's internal directory will maintain credentials and provide authentication services.

LifeRay Portal, which implements the generalized Web Portal functionality of *SmartPro MedEE*, provides the core of the Single Sign-On (SSO) environment. While the two underlying directories, the State's AD and Cúram's directory own their respective user ID's, LifeRay portal provides the point of logon. LifeRay then contacts the appropriate directory service, validates the user credentials, and passes those authentication approval / security ticket on to underlying applications. The LifeRay portal provides full library/document management capability with comprehensive search technology out-of-the-box. LifeRay provides several industry standard protocols to support a wide variety of underlying applications, including: <OPS018>

- CAS (Central Authentication Service) for Web based applications
- SiteMinder – Computer Associates SSO environment
- JAAS – Java Authentication and Authorization Service
- JOSSO – Java Open Single Sign-On
- LDAP – Lightweight Directory Access Protocol, option for connecting to Directories
- Microsoft AD – LifeRay supports Microsoft AD native connection for authentication

h) Business Rules;

Requirements: OPS017, RLE004, RLE005, RLE009, RLE012, RLE018, RLE032, RLE033, RLE034, RLE035, RLE036, RLE037, RLE038, RLE039, RLE040, RLE041, RLE042, RLE043, RLE044, RLE045, RLE046, RLE047, RLE048, RLE049, RLE050, RLE060,

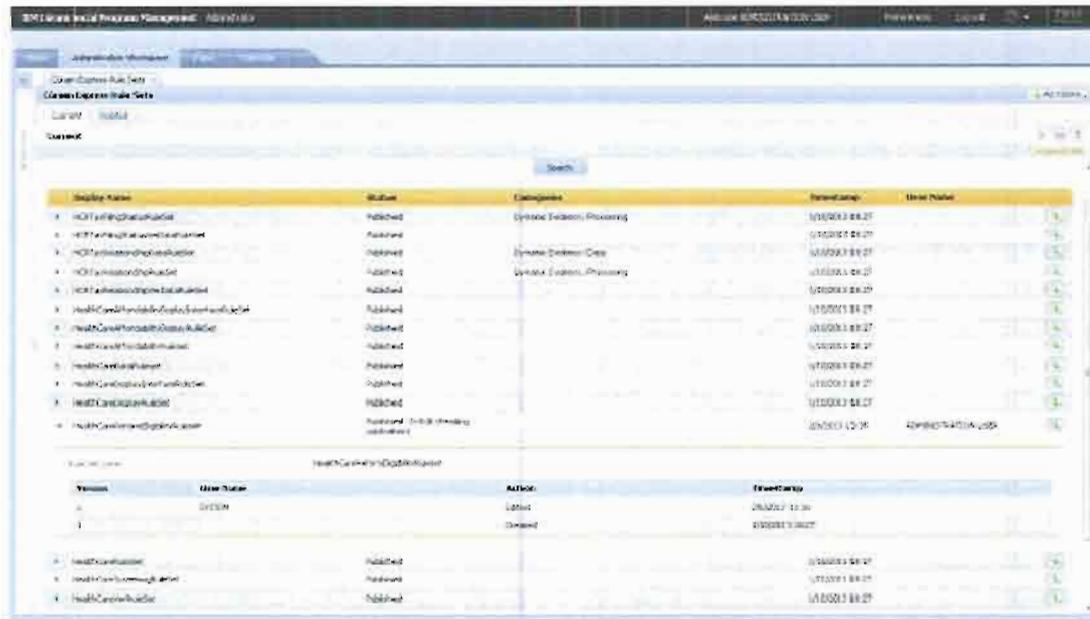

RLE061, RLE062, RLE063, RLE064, RLE066, RLE068, RLE072, RLE083, RLE086, RLE095, RLE096

Maintaining Rules

The IBM Cúram Social Program Management Platform (SPMP) Administrative tools provide support for maintaining rules and business elements, such as dynamic programs, that are associated with rules. The Cúram Express Rules (CER) Editor within the SPMP makes editing and maintaining rules straightforward as editing rules can be completed in-browser. Rules developed in this editor are versioned and time dated within the live production system. CER rule sets are stored within the EES version control system via XML files and are uploadable to various repository types. Wipro/IBM will work with the State of Nebraska on defining and configuring a repository of rules that can be made externally available. These rules are human readable XML files following the planned future MITA 3.0 guidelines. Additional files such as text documentation or related meta-data will be included as appropriate. Access to rules and publishing changes will be maintained with secure source control and administrator users' access with a set process to prevent invalid changes.

Within the IBM Cúram SPMP, administrators can view the program definitions and the effective dated versions of the eligibility rules associated with them. Rules are dated to one or more specific programs. Opening rules in the CER Editor provides users the ability to view program rules wholly, or in smaller sub components responsible for more granular decisions or calculations.

Administrators can confirm the validity of the rules and prevent conflict with other rule sets, as well as identifying other rules used by a given rule sets. For merging or comparing to other rules versions, XML tools available within the development toolset can be used to modify the exported XML version of the rules. Extending, copying, and reusing rules is supported through a documented process within IBM Cúram.

Rule Name	Status	Category	Effective Date	User Name
1. HCT FamilyChangeRuleSet	Published	Service Eligibility Processing	10/20/13 08:27	
2. HCT FamilyChangeRuleSet	Published		10/20/13 08:27

Figure IV-53: Effective Dated Version Tracking

The vocabulary of rules shipped in IBM Cúram is familiar to application analysts with business knowledge of the various programs. This familiar vocabulary allows the business analyst to navigate the rules and easily make required changes. Prior to releasing a new version of rules, a developer would iteratively test within their environment using the IBM Cúram provided unit test tools. To publish the rules for use in program calculations, users do not need to navigate a complex series of changes, across multiple products, using different multiple administration consoles. Instead, the IBM Cúram CER Editor and Configuration Transport Manager (CTM) enable changes to rules to be easily tested and deployed to multiple environments. Changes to rules may be rolled back to a prior version if issues are found in the rollout.

For changes to rules that impact ongoing cases within the EES IBM Cúram provides a Bulk Reassessment batch that automatically re-determines eligibility. Eligibility changes are automatically handled for active cases as this can be completed using Cúram’s role based security topology. If new rules are enforced for a given date, such as January 1, the system will automatically determine the new eligibility with the previous rules prior to January 1. After January 1, the system will automatically use the new rules for eligibility determination.

Third-Party Off-The-Shelf Management Tools

iii. Describe any proposed third-party off-the-shelf management tools and include detailed information regarding provider, product and version;

Table IV-10 documents the inventory of Off-The-Shelf Management Tools utilized by *SmartPro MedEE*. The first 3 tools are specifically part of the software solution set of *SmartPro MedEE*, licensed explicitly as part of *SmartPro MedEE*’s dedicated tool environment. Tools underneath the subheading “Data Center Enterprise Tools” are a subset of those tools implemented across Wipro’s data center operations, and are part of our shared services model. While these tools are used to manage and monitor *SmartPro MedEE* within our datacenter environment, they are neither exclusive nor specific to *SmartPro MedEE*.

These tools are part of Wipro’s general Data Center Management Tool Suite. Exact versions may vary as they are generally kept current and may be upgraded by the time *SmartPro MedEE* goes live.

Table IV-10: Data Center Shared Services Management Tools

SmartPro MedEE Management Tools	
Product Name and Version	Functions and Features
Tools included in the SmartPro MedEE Software Solution	
IBM PureSystems Manager	<ul style="list-style-type: none"> PureApplication Server Management and Monitoring

Data Center Enterprise Tools	

SmartPro MedEE Management Tools	
Product Name and Version	Functions and Features
Tools included in the SmartPro MedEE Software Solution	
Computer Associates Spectrum 8.0	System and Infrastructure Monitoring <ul style="list-style-type: none"> • Periodic polling of system resources (processors, memory, storage, switches, hubs, and routers) for availability • Establishing availability thresholds for various components by using industry standards, Wipro/IBM experience, and State input • Measuring actual availability against thresholds • Taking appropriate actions, as predefined by Wipro/IBM and the State, when one or more system resource thresholds are exceeded • Reporting monthly on availability • For PureApplication Servers, accepts alerts using SNMP
Emprisa	<ul style="list-style-type: none"> • Manages network device configurations
IBM AppScan Standard V8.8	<ul style="list-style-type: none"> • Scanning for internet Application vulnerabilities
McAfee Intrushield	<ul style="list-style-type: none"> • Network Intrusion Detection and Circumvention
Sophos Server AntiVirus	<ul style="list-style-type: none"> • AntiVirus / Malware Detection for Servers
Tripwire Enterprise V8	<ul style="list-style-type: none"> • File change alert generation / File Integrity Monitoring
Tenable Nessus V5	<ul style="list-style-type: none"> • Vulnerability scanning and reporting for network connected endpoints
NetIQ AppManager 6.0.2	<ul style="list-style-type: none"> • Coordinates with SmartCloud Workload Automation to monitor and report on Batch Jobs • Coordinates with PureSystems Manager to capture end-to-end system and application availability • Coordinates with PureSystems Manager to capture threshold alerts for system resource utilization, performance, and event log details • Storage and Data Management Monitoring
Servergraph Storage Console	<ul style="list-style-type: none"> • Monitor and Report on Backup jobs (Tape Storage)
Computer Associates eHealth	<ul style="list-style-type: none"> • Provides near real-time and historical reports showing LAN and WAN usage, availability, errors, usage trends and other customizable variables. • Reports are created and made available via the customer web portal with this service.
Computer Associates Service Desk Module	<ul style="list-style-type: none"> • Creation and Management of Service Tickets • Service Ticket Escalation Management • Customer Self-Service Portal

Audit Trail Capabilities

iv. Describe the audit trail capabilities of the EES;

Cúram provides robust auditing capability to enable administrative personnel to identify who has accessed, updated or requested sensitive information, what they accessed and when. Auditing can be reviewed based on data points including user role, location, or time. The type and extent of audit data captured can be tailored to meet specific implementation requirements. The audit data collected can be subsequently examined to support tracking, investigations or problem analysis.

To facilitate this, the following audit trail data is maintained by Cúram in the database:

- Date and time – the date and time of the transaction
- User ID – the ID of the user who invoked the transaction
- Table name - the name of the database table that was modified
- Program name – the identifier of the function that invoked the transaction
- Transaction type – indicates whether the transaction was online, batch or deferred
- Key info – the key that was provided to this operation.
- Details of changed data – these details are logged in an XML format

Cúram's auditing features supports a customer in the ability to apply full before-and-after imaging of records for all inserts, updates and deletes. Such functionality also allows for the restoration of recorded data, in the event of hardware or database failure. If required, Cúram can also be configured to audit all database reads (note, however that the impact on database traffic should be considered if read transactions are audited, to help ensure that end-user performance is not compromised within the production application).

Archiving and Restoring Data

v. Describe the processes used to archive and restore data from operational databases;

SmartPro MedEE does not archive or roll-off aged operational data in the normal sense. By default, operational data is never physically deleted from operational databases, though it can be logically deleted thereby rendering it invisible to non-administrative users of the system. Administrators can also restore to full visibility data that has been logically deleted.

Cúram will be extended to allow archiving of aged operational data while maintaining internal database consistency. Aging / Archival will be constrained to closed/inactive cases and to log data, such as logs of data access. The value of the aging threshold will be set in agreement with the State as determined in project execution. Aging / archival will normally be executed as a monthly job, and the resultant archives will be retained consistent with State requirements. Archived data will be restorable based on Archive date.

Technical Documentation Delivered With the EES

vi. Describe the technical documentation that comes delivered with the EES; and <IBM – Jack Hyman>

IBM Cúram offers a robust set of documentation, including the complete out-of-the-box data model, when one installs the Social Program Management Platform (SPMP). The SPMP is included as part

of the architecture because it provides the core enterprise case management functionality, rules, and workflow features needed to operate the Nebraska EES. The documentation is broken down into three areas: Business Analyst, Developer, and Administrator. Each of the areas has a specific purpose for its intended audience.

- **Business Analyst:** This documentation is written for the user who is typically responsible for doing standard system management activities (i.e. case level activities) and how to manage basic system functionality as an end-user or case manager with limited administrative access.
- **Developer:** This documentation provides architecture level details of how and what functionality within the platform as well as enterprise modules can be modified. Granular details on how to manage Web Services and API's are included as part of this documentation.
- **System Administrator:** System Administrator documentation is available to support those that will be maintaining the system administratively day – to – day including security management, rules development, workflow development, data model management, and assessment creation/management.

The Wipro/IBM team plans to provide specific documentation tailored to the Nebraska EES solution for end-user and administrative users as required. This will be prepared iteratively during releases. As part of the change management and operational readiness process, documentation will be updated as necessary.

Migrate Software and System Configuration While Multiple Environments

vii. Describe the approach that will be taken to establish:

- a) Multiple environments (e.g., sandbox, configuration/development, testing, quality assurance, production, training, and disaster recovery);

SmartPro MedEE is built upon a number of distinct system environments supporting the EES requirements. Each environment represents a unique set of workload characteristics, functional behaviors and purpose, and user base. And each presents unique needs for the synchronization and/or migration of data between itself and other environments.

Establishing and managing the multiplicity of system environments is one of the most complex aspects of large complex application lifecycle management. Classically, a large amount of initial development time, expertise, cost, complexity, and risk is devoted to the initial setup of core system environments, starting first with the Development and early Test environments, followed by Training and later Test environments such as Integration and QA/UAT, and culminating in the Production environments. The single largest element of this initial configuration work is the installation and integration of the complex middleware and environmental support software upon which modern applications are built. By itself, this purely technical, non-application oriented system work can consume many months of valuable schedule time and saturate some of the most senior technical specialists available to a project.

A major component in how *SmartPro MedEE* achieves its aggressive schedule and cost avoidance goals is by short-cutting a significant amount of this complex early work, and dramatically

simplifying its ongoing maintenance and support. Wipro's *SmartPro MedEE* makes extensive use of IBM's PureApplication™ server capabilities as its key to simplifying and shortening these complex start-up activities, and streamlining their ongoing management and support. This section describes how.

Several steps are required to establish the multiplicity of environments. Steps 1 and 2 are performed for all environments at the start of the project. Once environmental design is complete, ensuing steps are executed in priority order for each required environment. For example PMO, Developer and Data Conversion environments are needed very early, and are established first, while test and training environments can be installed later, and Production later still.

1. Identify the Environments – our response identifies the primary system environments we believe fulfills all of the requirements of the RFP, in Table IV-11 below. At the beginning of the project, this list will be validated with the State.
2. Finalize Environment Design – based on stated RFP requirements, we have sized and architected the salient top-level environmental characteristics, such as performance/capacity needs, security, access, data privacy/sanitization, backup recovery requirements and so forth. These high level design parameters in turn fed our proposed sizing, licensing requirements, virtual machine layouts, and software/tool deployments. Early in the project, these preliminary designs will be validated and designs finalized.
3. Establish and Configure VMs - using PureApplication's native tools, configuration of the VM environments, including VM provisioning and middleware deployment, monitoring, performance parameters.
4. Install and Load non-PureApplication Server tools / middleware – while PureApplication Server directly implements much of the middleware and tools environment, each environment must now have the correct non-PureApp tools and components loaded and configured.
5. Install Application Software – once the baseline environments are commissioned, application software, such as Cúram and LifeRay can be installed, and turned over to their controlling teams for initialization. These processes vary widely based on the environment's function. For example, the development environment receives its software configuration from the development team, whereas environment's found later in the SDLC process will be loaded and configured per established promotion processes based on their normal source of system and configuration.
6. Establish Initial Data – initial data loads are again specific to the environment, accommodating variances in size, PHI/privacy/security, and source.
7. Establish Change Management Processes – finally, change management processes are instituted, and environments are moved (as appropriate) under the correct level of change control and formality of promotion.

Identifying Environments

Table IV-11 identifies the initial system environments and describes their primary purposes. These environments are classified into two Types: System, and Support. System environments represent

varying aspects of the entire application solution, and embody most of its functionality. Examples are “Production” and “Sandbox”. Support environments are highly specialized, and do not present *SmartPro MedEE*’s primary functionality. Examples are “Data Conversion” and “PMO”.

Table IV-11: Description of System Environments

Environment	Alias	Description / Purpose	Type
Production	Prod	The primary Production environment, running in normal, non-DRR mode out of the Primary Data Center. Full functionality, full performance capacity, full live data. Sends database updates to DRR (Idle) in near real-time. Always runs alongside DRR (Idle), never with DRR (Act). Content derived from QA (Small or Large).	System
DRR Prod (Idle)	DRR (Idle)	A limited, database-only environment running in the Secondary Data Center that receives all database updates from Prod in near real-time. Is running only during normal, non-DRR mode. No functionality, limited performance capacity, full live data. Always runs alongside Prod, never with DRR (Act). Content derived from QA (Small or Large).	Support
DRR Prod (Active)	DRR (Act)	The Disaster Recovery version of Production: runs in the Secondary Data Center. Full functionality, full performance capacity, full live data. Differs from Prod in not sending database updates elsewhere. Never runs at same time as Prod and DRR (Idle). Content mirrored from Prod.	System
Development	Dev	Supports multiple instances of configuration and development. Near full functionality is available, though often not used. Limited performance capacity limited and sanitized data. Provides controlled updates into System Test.	System
System Test	Sys Test	System Test brings together one or more application components for formalized testing by QA. Near full functionality is available, though often not used. Limited performance capacity limited and sanitized data. Receives controlled updates from Development, provides controlled updates to Integration Test.	System
Integration Test	Int Test	Integration Test brings together most/all application components, including “outside” interfaces for formalized testing by QA. Full functionality is available, and often used. Limited performance capacity, limited and sanitized data. Receives controlled updates from System Test, provides controlled updates to QA (Small and Large.)	System
QA (Small)	QA (Small)	Aka User Acceptance (UAT). QA (Small) is used for most final acceptance testing, when full load / stress testing is not indicated. Full functionality, limited performance capacity, database can be full or limited as required. Receives controlled updates from Integration Test, provides controlled updates to Production. Only one of QA (Small) and QA (Large) are running at one time.	System

Environment	Alias	Description / Purpose	Type
QA (Large)	QA (Large)	Aka User Acceptance (UAT – Load/Stress). QA (Large) is used for final acceptance testing, when full load / stress testing is indicated. Full functionality, full performance capacity, full database. Receives controlled updates from Integration Test, provides controlled updates to Production. Only one of QA (Large) and QA (Small) are running at one time.	System
Sandbox	Sandbox	Sandbox is a specialized environment dedicated to State personnel for controlled experimentation and testing of limited changes to an existing or proposed environment – especially non-code-based changes such as rules, configuration, and Business Intelligence. Near full functionality (lacks outside interfaces), limited performance capacity, database limited or full as required. Can be rapidly refreshed to a known state. Normal refreshed state is Production functionality. Controlled updates mirror Production.	System
Training	Training	Training is a specialized environment dedicated to training staff, especially in the context of formalized instructor-led training. Near full functionality (lacks outside interfaces), limited performance capacity, limited and sanitized database. Functionality and data can be rapidly refreshed to a known state. Normal refreshed state is Production functionality, but can be imaged from QA (Small or Large) to train to a forthcoming release. Controlled updates mirror Production or QA (Small or Large.)	System
Data Conversion	Data Conv	Security is a highly specialized production environment optimized to running large data conversion jobs, in preparation for major implementations or upgrades. Limited functionality, limited performance capacity, full live database. Code base promoted from QA (Small or Large.)	Support
PMO	PMO	A specialized environment used to host tools used by the Program Management Office and the SDLC. For example, Requirements Management and Test Management. No connection with Production functionality, limited performance capacity, limited and specialized database.	Support

Each environment consists of one or more Virtual Machines (VMs). The layout of each environment’s VM configuration is driven by three primary considerations: security e.g. a firewalled separation between a Web Server tier and an Application Server tier; availability e.g. clustering; and performance e.g. multiple load-balanced VMs for high-performance production.

Finalize Environment’s Design

Before the environments are configured, their key design requirements will be finalized during requirements discernment and validation. These detailed requirements identify and validate the sources and sinks of configuration, code/applications, and data for each of the environments. For example, many of the environments represent formalized steps in the System Development Life

Cycle (SDLC), and implement formalized release promotion and management between environments. Others, such as the Training Environment, represent a mixture of tactical operations (refresh data for a class) and more formalized management (update the configuration/code base to reflect a new system release.) Another major variable is the type of underlying database: full vs. reduced size; live vs. sanitized data.

Table IV-12 is a summary example of the types of information to be finalized near the start of the project that drive final determination of environment configurations, prefilled in for the Primary Production Environment.

Table IV-12: Environment Characteristics (Summary)

Env. Name:	Production	Summary Purpose:	Hosts <i>SmartPro MedEE</i> production environment during normal, non-DRR operation.		
Data Center:	Omaha NE	Contingency DC:	Tempe AZ	Access:	Public Internet
VLAN:	Prod	VM Tiers:	Full 3-Tier	Firewall:	DMZ; Prod
Code Base:	Production	Code Source:	QA (L or S)	Code To:	NA
Code Mgmt:	Formal SDLC	Notes:	Includes Cúram, Portal, and BI		
Rules/Config:	Production	R/C Source:	QA (L or S)	R/C to:	NA
R/C Mgmt:	Formal SDLC	Notes:	Includes Cúram, Portal, and BI		
DB Base:	Production	DB Source:	Conv and Ops	DB To:	NA
DB Mgmt:	Formal SDLC	Notes:	DB updates shadowed to DRR (Idle) Environment		
Interfaces:	Production	Notes:	Full Internal and External Interfaces		
Monitoring:	Full	Notes:	Complete Ops monitoring of availability and perf		
CPU Capacity	Full	DB Size	Full	Sanitized:	No, has PHI
Notes:	Always runs with DRR (Idle); never alongside DRR (Act)				

Using this information, we will finalize and validate the specific design and deployment tactics for each environment. This encompasses variables such as:

- VM Layout and Provisioning, based on security, reliability, performance, and functionality
- Storage Layout and Provisioning
- Final Virtual NIC and VLAN configuration, based on security needs
- Environment refresh procedures, based on sources, sinks, and authorizations
- Data procedures e.g. does the environment require sanitization, downsizing, etc.
- Backup/restoration procedures
- DRR VM mapping – data center loss modifies the layout and performance characteristics

Establish and Configure VMs

In a classic approach, once the basic requirements for an environment are established, a significant and technically difficult effort is required to design, install/integrate, and tune the infrastructure and middleware required by each VM, and between VMs. This effort can easily consume several months

of elapsed time before the environments are fully ready for the deployment of applications. While present VM technology generally provides straight-forward means to tune individual VM's by varying their physical computing capacity (CPU Cores) and memory assignments, once established, the VM architecture is difficult to change, even in the light of new understanding and requirements.

SmartPro MedEE dramatically short-cuts this initial technical process of establishing system environments by using the advanced features of IBM's PureApplication server. PureApplication server implements a large suite of predefined, pre-integrated, and certified "Patterns" for environmental architectures and deployments. Examples of Patterns include "Multi-tier Web Application" and "Business Intelligence Engine". Patterns incorporate extensive knowledge of best practices for environmental architectures, and allow fully functional environments to be established literally within minutes, in response to response to a few simple questions. For example, a simple request for a three-tier "Web" architecture pattern, deploying two load-balanced Web Servers, 3 Clustered WebSphere Application Servers, and a DB2 Database Server can be defined, configured, and instantiated within a few moments time – including all required middleware integration. Furthermore, once established, a simple command will replicate the environment's definition and complete long term storage (applications, data) across a network to another PureApplication box serving as a contingency site for the primary environment.

Not only does this dramatically reduce the time, effort, and risk of establishing the initial system environments, it eliminates the largest impediments to optimizing or adding additional environments as needs are discerned and refined throughout the development and implementation process.

Install and Load non-PureApplication Server tools / middleware

Once the baseline environment is in place, supplemental tools and middleware are installed and configured, such as ITCAM for application performance monitoring. The actual components to be loaded vary by environment, and are based on the designs established in the second step.

Install the Application Software

In this step, each environment's application software is loaded and its preliminary configuration established. The exact content varies by environment. For example, the development environment will require an initial load of the baseline Cúram application, while the PMO environment will require the installation of SDLC management and test tools.

To achieve efficiency in initial setup, environments will be initialized through a shortcut of the ongoing, more formalized change management and promotion procedures. For example, Production is normally maintained by formalized and authorized promotion of code out of QA based on approval of User Acceptance Testing. However, at the very beginning, an early generation of Production will be established directly, to allow initial testing and confidence building of the underlying environmental configurations to be performed before complete promotion management is in place.

However, as the project progresses and environments are stabilized, software configuration management will be shifted to implement the production designs for change and configuration management, and synchronization.

Establish Initial Data

Similar to the Application Software, initial data loads are again specific to the environment, varying both based on function, and maturity of the change management and synchronization processes. Initially, environments will be populated as required by test data, to allow early testing and confidence building in the validity of the environment's basic technical layers.

As the project progresses, data maintenance will be shifted increasingly to reflect production change and configuration management, and the attendant promotion and synchronization processes.

Establish Change/Configuration/Synchronization Management Processes

Once environments are stabilized, they will begin to be converted stepwise to follow full change management, configuration management, and synchronization processes. For example, test environments will be populated based on authorized promotion procedures, based on their underlying official sources or record, rather than based on interim procedures designed to optimize initial setup.

- b) Procedures used to migrate software and system configuration (e.g. rules, workflows) from one environment to another; and

IBM/Rational Team Concert is used to maintain the repository of record for configurations, current, historical, and developmental. Promotion upstream in the lifecycle i.e. from Development to System Test to Integration Test to QA to Production is controlled by the change management processes under formal authorization. At the same time, development is normally free to retrieve or refresh its configuration from any authorized version.

Under normal conditions, each environment has an identified formal owner and authorized representatives that control promotion into the environment. Functionally, the PMO, Development, System Test, and Integration Test environments are owned by the Wipro/IBM team, while the QA Environments, Sandbox, Training, and Production Environments are owned by the State.

As a formal build (code / configuration / data) is made ready to be promoted upstream, the owning party formally approves and communicates that approval to the representative of the source, and coordinates the scheduling of the promotion event. For example, the designated State authorized representative of the QA environment would normally determine, based on fulfillment of gating factors, that a build level is ready to be promoted out of Integration Test and into QA, and would schedule that promotion event with the representative of Integration Test. The build level would be frozen in the Configuration Management tool (Rational Team Concert), and picked up and the promotion executed by the receiving party or their authorized representative. Normal promotion workflows will be highly automated, triggered by the "receiving" representative's authorization, and include fallback and restoration procedures as a contingency against error.

Environments such as Sandbox and Training partake of the same general process, but in practice will also maintain a "refresh" workflow, to allow the owning authority to institute an automated reversion to a set of authorized known configurations, including code, rules, and data.

c) Steps needed to maintain the synchronization between environments.

Synchronization requirements between environments encompass a mix of environment, code, configuration, and data. Synchronization of builds requires coordinated change between these three components within an environment i.e. data has to match code has to match configuration. It also requires synchronization between environments i.e. Training generally requires an implementation of Production Code and Configuration, running against a compatibly structured set of Data that is both reduced in size and sanitized, on a limited environment. DRR Production, on the other hand, requires the full current Code and Configuration, running on a complete Environment, with the latest production live Data.

PureApplication Server's VM management environment provides one of the key tools required by *SmartPro MedEE*. As each VM Environment is configured, that configuration is captured, and can be instantiated as needed within moments, on the original hosting environment, or on another. This basic tool is used to facilitate moving environments between Data Centers, and restoring environments in recovery from a disastrous failure. It also provides a rapid mechanism to re-refresh a complete Environment in place, including its code, configuration, and data. For example, refreshing Training to its default state.

Environments, absent their operational data, are generally small enough that it is practical to retain several versions as static, non-instantiated VM configurations, available for rapid, on-demand deployment. This is specifically useful for Sandbox, Training, and Development Environments, when it may be desirable to be able to easily instantiate a recent older build, to test its precise behavior, or to compare and contrast it with the present production environment. PureApplication Server's VM management capabilities support most of the heavy lifting to provide this functionality out-of-the-box.

The second component is Data. For any given data design, there are 4 basic combinations that must be maintained: the full sized production data, used by Production and sometimes by QA; full size, but sanitized, used for Load/Stress testing; limited size and sanitized, used by Development, most pre-QA testing, and by Training; and lastly reduced size but live data, often required in Sandbox and sometimes by QA.

When a new system build is being prepared, part of the analysis and preparation is the determination of the usability of the existing data sets; if new data is required, for example, by a schema change, then appropriate project tasks are scheduled to create/prepare the required data, using the toolset of the Data Conversion Environment. Depending on the build's requirements, Data Conversion may be used in a development mode to create interim test data for use prior to implementation. Execution of final data conversion of production data, and creation of datasets derived from this production is normally scheduled as part of the implementation step for the build.

Once created, data sets derivative of a production data set need no longer be kept synchronized with production data, up until the next time a new build requires a change to data organization or content. Once created, these derivative datasets are stored in locations commensurate with their security classification, and cataloged in Configuration Management as compatible with the build. Due to space considerations and absent a compelling reason to retain them, full-size data sets that are no longer compatible with production will usually be archived to offline storage, once sufficient

time has passed that the new implementation is considered fully stable and there is little risk of requiring a rapid roll-back. Small datasets may be retained online for longer time periods, if desired.

At the heart of this process is Rational Team Concert, which retains the permanent history of configuration management data – most importantly, it is the ultimate repository of truth regarding the contents of Environments current baselines, component and data compatibility, and the historical perspective.

c. *System Security and Disaster Recovery*

In this section, the Wipro/IBM team identifies our approaches and basic techniques employed by us and by our *SmartPro MedEE* solution to address overall system security and disaster recovery.

Building upon already established baseline security policies and procedures that Wipro implements across its Data Centers, our security professionals, guided by our Government Healthcare Systems Information Security Officer, produce customized security policies, processes, and practices. These are validated with the State, and then incorporated into our *SmartPro MedEE* implementation.

The implementation of *SmartPro MedEE* is fully redundant, without a single point of failure in its network, hardware, storage, and middleware. To achieve the highest degree of system availability possible under normal operations, the software architecture makes aggressive use of software redundancy, such as clustering with automatic internal fail-over and restart, to achieve maximal availability levels. Additionally, all components are actively monitored by our Data Center's Enterprise Management System, with real-time alerts to human staff should components fail, resources become over-burdened, or response times suffer.

Our Disaster Recovery approach provides an optimal mix of cost-effectiveness, simplicity of design, and minimal time to recovery and loss of data. The overall mix of EES Environments e.g. Production, Training, Sandbox, QA and so forth are distributed between two of our Data Centers. Each center is configured with a single matching IBM PureApplication Server. All hardware is normally engaged in useful work in a normal operating environment: Production and some of the supporting Environments executing in our Primary Data Center in Omaha, Nebraska; other supporting environments running out of our Secondary Data Center in Tempe, Arizona. In normal operation, the Production environment keeps a shadow copy of the database current in the secondary site using native DB2 log shipping capabilities, using minimal system resources. Should the primary site fail disastrously, the DRR site can be brought up to full production capability within hours or less, with little (moments) to no loss of data. Simultaneously, all other supporting environments can be subsequently brought back online, though with reduced capacity during contingency operation.

Securing Technical Controls and Technology Solutions

Wipro has a dedicated Government Healthcare Information Security organization that coordinates policy, implementation, and review of security for the healthcare domain. This organization coordinates the line security organizations, such as Data Center Security, to ensure that security policies and practices unique to healthcare are properly understood and implemented.

During the implementation of **SmartPro MedEE**, this organization consults with the implementation team to ensure compliance with security policy, and the implementation of best practices, both by the application team and the IT Infrastructure team. Representatives of the Security Organization also consult with project leadership, both Wipro/IBM and the State, providing them with guidance and actionable recommendations regarding security.

The Cúram Application is designed out-of-the-box to support the functional and data security needs for Medicaid Eligibility and Enrollment, fundamentally based on a Role Based security model. This includes a pre-analysis of data sensitivity as it relates to **SmartPro MedEE**. On an ongoing basis, Wipro's Healthcare Security Organization is responsible for maintaining currency with industry and governmental standards for data sensitivity, and exercise this control through formalized policies and procedures for analyzing and reacting to data sensitivity needs.

SmartPro MedEE provides for positive user identification through two paths, one for internal users and the other for external. For internal users, **SmartPro MedEE** will utilize the State's Microsoft Active Directory implementation as the source of truth for User Authentication. External Users (citizens) are managed by Cúram's internal user directory, based on positive identification. Once authorized, Cúram maintains the mapping of users to roles, the basis of **SmartPro MedEE** RBAC security design. <OPS011>

Site authentication is generally performed via certificate exchange by the communications layers, for both batch and transactional interfaces.

SmartPro MedEE supports VPN-based access. VPN tunnels will be established between the State's and Wipro's Data Centers, to secure internal traffic between the State and **SmartPro MedEE**. These tunnels carry both system-to-system traffic (interfaces), and State user traffic. State users of **SmartPro MedEE** may use the State's own internal networks, or the State operated VPN to access the State's internal networks. Once traffic is on secure State networks, it will be securely carried over VPN tunnels through the public Internet between the State and Wipro facilities. By using this model, State employees only interact with their own State VPN – they need not be explicitly aware of Wipro's VPN implementation. However, State staff can also access their **SmartPro MedEE** portal over the public Internet using Wipro's Juniper VPN, should they so choose.

SmartPro MedEE is implemented on high availability hardware (IBM PureApplication Server) that is fully redundant, without single points of failure: multiple CPU nodes, power supplies, busses, network interfaces, RAID disk storage and so forth. The surrounding network fabric, including routers, firewalls, load balancers, security appliances and circuits is also fully redundant. For the Production Environment, the application architecture is implemented with clustering for both performance (load balancing) and redundancy. Finally, the Disaster Recovery site continuously receives database updates from the Production Environment, so it has a full and current shadow copy of the production database at all times, with little or no loss of data in flight should the entire primary instance fail.

SmartPro MedEE is designed from the bottom-up for serviceability, in its hardware, middleware, and application design. The IBM PureApplication Server can be physically maintained, and even expanded, without interruption of service. The PureSystems Manager and IBM middleware environments operate in concert to allow dynamic tuning, including automatic self-tuning, of

physical resources to meet performance targets. Virtual Environments can be rapidly configured, altered, tuned, and migrated between servers within moments. The Cúram Application is designed for fine-grained incremental deployment, so that only modules affected by a change need to be deployed into production to implement a service release.

Specifications for Components of Proposed Security and Disaster Recovery Solution

Disaster Recovery is based on a second instance of a single PureApplication Server Appliance and related network hardware configured identically with the primary version. The primary instance operates out of Wipro's Primary Data Center in Omaha Nebraska, the secondary out of our Tempe Arizona Data Center. Each instance of the two servers hosts a subset of the total suite of Environments (Production, QA, Training...), and is fully part of the total workload mix during normal operations – no specific hardware is dedicated sole to a backup function. However, in the event of the loss of either site, the Workloads that normally are assigned to the lost site can be assigned to the remaining site, though with some loss of capacity except for the Production Environment.

The standard HW environment we are configuring for *SmartPro MedEE* consists of a pair of identical PureApplication servers, one for each of our two Data Centers associated with *SmartPro MedEE*. This standard configuration comprises:

1 – PureApplication Server 1700-64E

- 42 U (Large) rack, provides space for expansion up to 608 Cores
- 64 Power7+ (750) CPU Cores, in two nodes of 32 Cores
- 512 GB DDR3/1066MHz Memory per Node, total 1 TB RAM Memory
- 16 x 400 GB Solid State Disc Drives
- 80 x 600GB Magnetic Disc Drives
- 4x40 Gbps Ethernet, 4x16 Gbps Fiber Channel
- AIX Operating System

Full recovery procedures will be developed and documented as part of the development project. Please refer to response Section entitled System Security and Disaster Recovery immediately preceding for a full explanation of the overall Disaster Recovery Approach.

Network HW

The datacenter security solution is based on a mixture of hardware and software operating within the Network Fabric of Wipro's Data Centers.

Each server is protected by the Unix platform Sophos anti-virus software, which is maintained with full currency of its detection patterns. Sophos raises any security alerts to each Data Center's Enterprise Management System.

McAfee Intrushield and Palo Alto IDS appliances, provide intrusion detection, and also raises alert to the Enterprise Management Environment, based upon threshold configurations.

Tripwire Enterprise Edition monitors the *SmartPro MedEE* servers for unauthorized file changes.

Tenable Nessus provides vulnerability scanning and reporting within the data center for all network endpoints: both network fabric and the servers.

Computer Associates NetIQ AppManager monitors server log files for a large variety of operational events, including security alert events generated by the Operating System or any other hosted software.

While our auditing and certifications processes don't allow us to specifically note model or part numbers that comprise our network, at the core of the Wipro DCS network environment sits industry leading manufacturers such as, Cisco, Brocade, F5, Juniper and CheckPoint.

Supporting Identity and Access Management

The Cúram application of *SmartPro MedEE* implements compliant identity proofing logic, out-of-the-box. The Cúram Universal Access Portal component orchestrates policy implementation of proofing citizen identity.

SmartPro MedEE is built upon a Role-Base security model, where users are assigned roles that then control the functions they can see and perform, the data they can access, and whether or not they can alter specific data. The configuration capabilities of *SmartPro MedEE* support contextual assignment of user roles, such as time-based role modification. The *SmartPro MedEE* Portal logic permits user preference recognition and customization.

SmartPro MedEE maintains and reports on extensive audit trails, capturing complete information on record access and/or alteration. *SmartPro MedEE* captures who, what, when and changes made as part of its standard logging and audit capabilities. This supports bi-directional tracing, either from individual to data ("What information did this person access?") and from data to individual ("Who accessed this information?")

SmartPro MedEE classes its users into two groups: internal (State, administration, operations) and external (citizens). Internal users are authenticated against the State's Microsoft Active Directory; once authenticated, the Portal logic provides a Single Sign-On experience within *SmartPro MedEE*, including access to the Eligibility and Enrollment modules, Business Intelligence, and the Information Portal. External (Citizen) Users who are establishing a personal User ID, or are authenticating themselves against their already established ID, interact with Cúram's Universal Access Portal, which maintains and validates their underlying credentials. They also have a Single Sign-On experience across the functions and modules of *SmartPro MedEE*. For both classes of users, internal and external, *SmartPro MedEE* administers and maintains the mapping of users to their roles.

Application Encryption

Encryption of data, be it at rest or in flight, is managed by a very limited set of system and middleware tools.

- IBM DB2 Advanced Enterprise Server Edition, Version X.Y, is used to encrypt sensitive data at rest
- IBM WebSphere Application Server Network Deployment, Version X.Y, manages the SSL (HTTPS) encryption of Web Browser interactions

- IBM Integration Bus HV Edition for AIX, Version 9.0 (aka IBM Message Broker) provides Secure FTP services for select batch file transfers, and secure message delivery
- IBM Sterling Direct Connect and File Gateway, Version X.Y, provides another implementation of secure, protocol specific batch file transfer protocols
- Juniper VPN to establish secure tunnels between the State's and Wipro's Data Centers, for both user to system traffic, and system to system traffic.

Supporting Privacy and Consent

SmartPro MedEE is fundamentally built upon role-based security: every individual accessing the application suite is assigned a role that determines what functions they are allowed to see and perform; what data they can access – both records and fields; what they can do with that data (read versus modify.) This includes external users as well as State users, administrators, and system operators. Role mapping to functions and information access will be validated during Requirements Analysis, and will conform to State policies.

SmartPro MedEE distinguishes between internal and external users, offering two distinct entry points for the two general classes of user. External participants, i.e. citizens, access *SmartPro MedEE*/Cúram over the public internet through the IBM Cúram Universal Access module, which provides direct control over the functionality and information the external user is allowed to access.

Internal users, such as case workers, supervisors, and system administrators, access their own internal Portal, which is not directly visible over the public Internet – access is restricted to the internal State network, or VPN equivalent.

Restrictions can include both records e.g. whose data, and fields, e.g. confidential data. External users can be restricted to their own data; case workers to their own assigned cases with certain confidential data hidden; supervisors may be configured for broader access. Each user experience is tailored to the users identified system role, and hence their access rights.

Audit Trails

SmartPro MedEE consolidates log events from multiple sources into a single unified view. There are several technical sources of logging within *SmartPro MedEE*: the systems environment (PureApplication Server, Operating System, Middleware); the application code (Cúram); the Data Center Network Fabric (routers, firewalls, load balancers); specialized monitoring software (file change/deletion monitoring.)

The individual Data Center Monitoring tools work in concert to continuously consolidate exception events from all logs and subcomponents. These exception events are reported to the centralized Data Center monitoring environment, for notification, reporting, and management. These are events that are deemed to require immediate human notice and possible intervention, such as a security breach or component failure.

The detailed logs are extracted and consolidated into a single database repository, expressed as a Data Mart, which is then available for query, inspection, and analysis using the Business Intelligence toolset provided by Cognos. The definition of the information to be captured and reported is defined and maintained by the Comprehensive Security Plan.

Stale data is archived and purged, based on a retention timeframe to be jointly determined by the Wipro/IBM team and the State during Requirements Validation. Archived log information can be retrieved and restored when required. <OPS017>

Maintaining Confidentiality, Integrity and Availability (CIA) of the Database Management Systems

Confidentiality, Integrity, and Availability of data is managed directly by the Cúram application within ***SmartPro MedEE***. Every user of ***SmartPro MedEE***, internal and external, is assigned a role; roles are configurable to implement the business rules of Confidentiality. Key capabilities include:

- Role-Based Controls over what sets of data a role may view. For example, a Citizen may only view their own data; a Case Worker their assigned cases; a Supervisor may be permitted to see all cases.
- Role-Based Control over what fields / data elements a role may view. For example, some user roles will suppress PHI data, while others will allow the display of PHI.
- Role-Based Control over what can be done with specific information by a role. For example, the ability of a role to merely view information versus permission to update that information.

Roles can include contextual business rules, such as variability of the role's capabilities based on time. For example, select information can only be viewed during defined working hours by a Case Worker, and not viewed or manipulated off-hours.

All information touches are logged, so it is always possible to discern what information was created, viewed, or altered by an individual, including when the access was made, and if altered, what was the data before and after the alteration. This can also be traced from the perspective of the information: which user(s) or systems/interfaces created information, viewed it, or altered it, and when.

Outside of the ***SmartPro MedEE*** application, the hosting environment also implements a number of CIA features:

- Select Data is encrypted within the database using native DB2 functionality, so that sensitive data is not exposed through back-doors outside the control of the application.
- When required, non-Production Environments operate against obfuscated data, created with the assistance of IBM's tool InfoSphere Optim Test Data Management. For example, Environments such as Training, System Test, Integration Test, and Development would never be loaded with discernible production data. However, fully obscured subsets of realistic data will be created using this obfuscation tool.
- Data is encrypted when in flight, using either /or both secure protocols e.g. SFTP or Connect Direct and encrypted links e.g. VPN. Browser traffic is encrypted with HTTPS/SSL.

- Tripwire Enterprise monitors files for unauthorized modifications or deletion, alerting up to the Data Center Enterprise Monitoring system if it detects a policy violation.
- The overall system architecture is designed for high availability at all levels, including fully redundant hardware and networking (no single point of failure), clustered middleware servers (web, Application, DB) with auto-failover, complete transaction logging, and near real-time shadowing of all database updates to a contingency Data Center for Disaster Recovery.

Security Measures to Protect System Components

Wipro maintains extensive standards for the baseline security measures applied to environments it manages and operates. These baseline policies and procedures cover:

- Operating System security configuration and hardening
- Middleware configuration and hardening
- VLAN separation of security domains
- Firewall separation of application tiers (DMZ, Secure Zone)
- AntiVirus / Malware protection and detection for Servers and Workstations
- Public Certificate management
- VPN policies and management
- Identity Management Standards, password policies, use policies, aging policies
- Network based intrusion detection and protection
- Server and Workstation based intrusion detection and protection
- Proactive and managed updates to environments to accommodate vendor security patches and Wipro engineered security changes
- Active centralized monitoring and response to security events
- Vulnerability scanning, both internal and public Internet
- Annual security awareness training and testing for all employees and contractors; HIPAA specific training and testing for employees working with Healthcare systems

These baseline procedures cover all systems, operations, and development activities, serving as a starting point for domain specific policies and procedures.

Wipro maintains a dedicated information security team for Government Healthcare systems, led by a certified Information System Security officer. This organization engages with the teams responsible for healthcare automation, including the **SmartPro MedEE** team. Using the baseline security policies and procedures as a starting point, the healthcare security organization works with the **SmartPro MedEE** team to extend and customize them to meet the specific needs and requirements of the State for EES, including in the application domain. This team draws upon internal technical experts in architecture and security, along with external experts when required to jointly codify the initial comprehensive System Security Plan, which is formally reviewed and approved by the State.

Once established and executed, the comprehensive Security Plan is a living document, subject to change and enhancement as knowledge of security best practices advances, and new relevant regulations and standards are created. While managed through the normal Change Management

processes, this Plan is not strictly a one-way response to State initiated change: Wipro is a full partner with the State in identifying and recommending changes to maintain currency with prudent state of the art security measures.

Supporting Data Backup

Within our Data Centers, all Environments (Production, QA, Training...) of *SmartPro MedEE* are backed up according to custom documented backup procedures that build upon our Data Center's Standard Operating Procedures.

Each Environment of *SmartPro MedEE* is defined as a customized Workload comprised of one or more VM definitions. Each of these definitions, including middleware, application code, configurations not held in the databases are maintained with the PureApplication Server's library of Workloads. As part of Change and Configuration Management, these Workload definitions are copied across to each center's opposite. For example, the Production Workload definition is normally assigned to our Primary Data Center, so the PureSystems Manager tool is used to synchronize a copy of this Workload and its constituent VM definitions to the Secondary site, in case a DRR scenario must be invoked. Each Workload assigned to normal operations in the Primary Center is synchronized with a copy in the Secondary Center. Conversely, Secondary Center normal Workloads are copied to the Primary Center, so they could be immediately instantiated if the Secondary Center was lost. While normal operational work is split at the Environment level, each center always has a current copy of all Workloads ready for dispatch.

For Environments with relatively small databases and file-stores, such as Training and most Test Environments, the data sets are backed up to the opposite Data Center nightly, or as appropriate to the function of the workload (data sets that only change as a result of Change / Configuration Management can be copied when changed, rather than nightly.) Additionally, these data sets, along with the Workload definitions, are backed up nightly to tape, and stored offsite for disaster recovery purposes, per agreement with the State.

The Production environment, with its large and dynamic data store, is kept synchronized in near real-time to a shadow copy using native DB2 log shipping technology. This shadow copy, which will normally be within a few minutes or less of full concurrency with the production database, serves as the online backup of Production. Additionally, the Environment is backed up to tape nightly and stored securely offsite. Additionally, one or more local, disk-based generation copies of the Production Environment will be maintained using PureSystems Manager, to allow the rapid back-out as restoration of a prior version of *SmartPro MedEE* should that be required. General Approach to Recover from a Disaster and Providing a Disaster Recovery Plan

Describe the general approach to reestablishing operations in the event of a catastrophe, as well as its approach to providing the State of Nebraska with a Disaster Recovery Plan; and

SmartPro MedEE is implemented on two identical IBM PureApplication Servers; the first located in our Primary Data Center in Omaha, Nebraska, the other in our Secondary Data Center in Tempe Arizona. Using native DB2 functionality, the primary Production Environment ships its database log files to the secondary system, which applies them in near real-time to a shadow copy of the production database. Non-database information, such as VM configurations and code bases are kept synchronized between the two centers as part of regular Change and Configuration Management,

using PureApplication Server's native VM shipping capability. If a disaster is declared that requires failover, the secondary site's instance of the full Production Environment is instantiated, network addressing is adjusted, and full operations can be restored within hours, with little or no loss of data in-flight. Due to the database log shipping, the core data will already be in place at the DRR site, so there is no need to wait for the retrieval of offsite backup tapes, or restoration of the large production database.

Both the primary and secondary centers share execution responsibilities for the various Environments (Production, QA, Sandbox...) that comprise *SmartPro MedEE*. At any one instant, a specific Environment is assigned to only one Data Center; for example, Production normally executes in the Primary Data Center, while QA is assigned to the Secondary Center. This sharing of the workload provides for a reduced overall hardware complement, as all hardware is available and in use at all times: nothing is solely dedicated to Disaster Recovery.

The Non-Production Environments are also part of the Disaster Recovery plan, and can be restored at will in either center should the other center fail – though with a less rigorous RTO than the Production Environment.

Disaster Recovery planning begins during Requirements Analysis, validating its formal requirements. The development of the DRR plan follows the same lifecycle as the rest of *SmartPro MedEE*, with components of design and implementation flushing out the detailed procedures and processes of the formal plan. During early testing, System and Integration, the DRR plan will be exercised with a small limited dataset, to validate the basic correctness of the procedures. Later in testing, when full-sized Load/Stress data is available, the DRR plan will be exercised in full, including testing the reversion to normal operations. In practice, initial restoration time is not very sensitive to database size, as the shadow database is begin continuously updated and does not require restoration as part of DRR failover. In these late tests, all environments will be tested for DRR restoration, simulating both a failure of the Production Environment / primary site, and the reverse: a failure of the secondary site, requiring restoration of several of the supporting Environments into the primary site.

Provide specifications on any hardware and software components utilized by the proposed security and disaster recovery solutions. Include the required components, configurations and procedures to enable a recovery.

Disaster Recovery is based on a second instance of a single PureApplication Server Appliance and related network hardware configured identically with the primary version. The primary instance operates out of Wipro's Primary Data Center in Omaha Nebraska, the secondary out of our Tempe Arizona Data Center. Each instance of the two servers hosts a subset of the total suite of Environments (Production, QA, Training...), and is fully part of the total workload mix during normal operations – no specific hardware is dedicated sole to a backup function. However, in the event of the loss of either site, the Workloads that normally are assigned to the lost site can be assigned to the remaining site, though with some loss of capacity except for the Production Environment.

The standard HW environment we are configuring for *SmartPro MedEE* consists of a pair of identical PureApplication servers, one for each of our two Data Centers associated with *SmartPro MedEE*. This standard configuration comprises:

- 1 PureApplication Server 1700-64E
- 42 U (Large) rack, provides space for expansion up to 608 Cores
- 64 Power7+ (750) CPU Cores, in two nodes of 32 Cores
- 512 GB DDR3/1066MHz Memory per Node, total 1 TB RAM Memory
- 16 x 400 GB Solid State Disc Drives
- 80 x 600GB Magnetic Disc Drives
- 4x40 Gbps Ethernet, 4x16 Gbps Fiber Channel
- AIX Operating System

Full recovery procedures will be developed and documented as part of the development project.

Network HW

The datacenter security solution is based on a mixture of hardware and software operating within the Network Fabric of Wipro's Data Centers.

Each server is protected by the Unix platform Sophos anti-virus software, which is maintained with full currency of its detection patterns. Sophos raises any security alerts to each Data Center's Enterprise Management System.

McAfee Intrushield and Palo Alto IDS appliances, provide intrusion detection, and also raises alert to the Enterprise Management Environment, based upon threshold configurations.

Tripwire Enterprise Edition monitors the *SmartPro MedEE* servers for unauthorized file changes.

Tenable Nessus provides vulnerability scanning and reporting within the data center for all network endpoints: both network fabric and the servers.

Computer Associates NetIQ AppManager monitors server log files for a large variety of operational events, including security alert events generated by the Operating System or any other hosted software.

While our auditing and certifications processes don't allow us to specifically note model or part numbers that comprise our network, at the core of the Wipro DCS network environment sits industry leading manufacturers such as, Cisco, Brocade, F5, Juniper and CheckPoint.

d. System Performance, Availability and Capacity

i. Describe the ability of the proposed solution architecture to support:

- a) Internal case workers, and external participants;

SmartPro MedEE using IBM Cúram offers two entry points for users of the Nebraska EES. The internal case worker has their own portal entry point to conduct all case management activities to support eligibility and enrollment of a citizen or provider of services. Other roles that have access to the internal portal user experience include a system administrator or case supervisor. These roles can manage and modify case related functionality including workflows, business rules, and case related data as required. To access *SmartPro MedEE*, internal caseworkers will log on to *SmartPro MedEE* by first accessing the State's own internal network – either via their State VPN if they are connected over the public Internet, or directly if they are connected directly to a State network. Once they are

securely accessing the State's own internal network, their access to *SmartPro MedEE* will be carried over a secure data center to data center VPN channel between the State and Wipro. *SmartPro MedEE*'s portal will validate their user credentials against the State's Microsoft Active Directory before granting access.

The external participant, which could be a citizen or a delegate to the citizen, will have their own publicly accessible user experience using the IBM Cúram Universal Access functionality of *SmartPro MedEE*. Each user experience, depending on role and required services is tailored to a user's access rights and identified system role. External participants will access *SmartPro MedEE*'s web-interface over the public Internet, connecting through *SmartPro MedEE*'s Portal functionality.

b) **Mission-critical services/Service Level Requirements;**

SmartPro MedEE consists of a collection of commercial off the shelf tools configured and customized to meet the demands of the State of Nebraska infrastructure. Mission critical systems and service level requirements would be met through the implementation of failover redundancy and high availability of servers. Performance monitoring will be facilitated through the use of various tools included as part of the application server. Additional tools including IBM's PureSystem Manager and ITCAM, and Computer Associates Spectrum 8.9 are integrated into the Nebraska EES system to evaluate system performance, application and data latency, and overall system health. If one of the mission critical systems breaches a service level requirement, the appropriate designated system administrator is notified to review mission-critical operational systems immediately.

SmartPro MedEE uses IBM PureApplication Server as its hosting environment. For mission critical environments, such as Production, several techniques are used to ensure continuity of service and management to Service Level Requirements:

- Logical Server tiers (Web, Application, Database) are engineered with mission-appropriate redundancy including clustering with load-balancing and auto-failover within WebSphere
- Storage is configured with an appropriate level of redundancy to meet engineering goals for reliability and performance using RAID configuration
- The PureApplication Server Appliance itself monitors and self-manages resource utilization and dynamically adjusts physical resources to meet configured targets. For example, assigning additional CPU cores to an over-burdened VM.
- Higher-level monitoring tools, such as ITCAM, monitor for application and service availability and performance, and raise alerts for human intervention if target service levels or availability are threatened
- The PureApplication Server Appliances that hosts *SmartPro MedEE* are fully redundant high-availability designs, with multiple power supplies, redundant Network Interface Cards, multiple CPU's and CPU Nodes with failover
- The Data Center network fabric, routers / firewalls / load balancers is fully redundant and monitored
- *SmartPro MedEE* is implemented in two complementary Data Centers, each hosting an identical PureApplication server assigned solely to *SmartPro MedEE*. During normal operations, the Environments e.g. Production / Sandbox / Training etc. are each assigned to run in one of the two centers, splitting the workload. The Production Environment, when

executing in the Primary Data Center, ships its database logs to the Secondary Data Center, where they are applied in near real-time to a shadow database. If the Disaster Recovery scenario must be invoked, the Production configuration is instantiated in the Secondary Center within hours or less, with its database ready to go with little or no data loss from the failure. Using more standard techniques of restoration (restoration of data from backup media), all other environments can be re-assigned between centers if needed. For example, non-Production Environments such as QA, which normally run in the secondary Data Center, can be re-assigned to the Primary Center if the Secondary site were to be lost. Each PureApplication box is physically configured to be to run all Environments simultaneously, without compromising the performance of the Production Environment; however, non-Production environments would run with reduced capacity in a DRR scenario.

c) **Ease of management;**

SmartPro MedEE, in leveraging IBM Cúram, has selected a platform that is built on a J2EE web-based architecture. All applications are web-based. Unless a change requiring integration with IBM Cúram to a third-party system (data source) or a custom interface is required within the Cúram Web-Based platform, all administrative and system management changes can be completed using a standard Web browser such as Internet Explorer, Firefox, Chrome, or Safari. Specifically, managing the Cúram environment can be broken down into four subsets:

- **Enterprise Framework:** The Cúram Application is built on an enterprise framework that allows for a single view of a customer using a robust case management platform. As a COTS solution, all business rules, workflows, assessments, and platform level configuration can be configured using a Web browser.
- **Enterprise Modules:** Modules are extensions of core functionality that allow the MLTC to accomplish program-based activities such as Provider Management, Outcome Management, Social Enterprise Collaboration, Universal Access, and Life Events Management. Combining the framework and module capabilities will provide the State of Nebraska the tools needed to operate EES.
- **MLTC Configuration:** Each MLTC has its own rules, workflows, and vocabulary to describe business functions to name a few unique system characteristics. As part of the Web-based interface, MLTC specific configurations can be completed using a standard Web browser. Such an activity is often completed by a case supervisor or system administrator.
- **MLTC Extensions:** The only time where functionality cannot be managed inside of Cúram or one of the supporting applications directly using a Web browser is for a subset of requirements that cannot be met by configuring functionality using the COTS product. For example, an interface that may integrate one or more data sources into a custom Web page leveraging the J2EE framework. MLTC extensions can be deployed using the Cúram Dynamic Configuration functionality. A new deployment of a specific feature within the platform or a module will not impact an entire deployment.

Figure IV-54: Meeting MLTC Requirements

SmartPro MedEE is hosted on IBM's PureApplication Server Appliance, which is specifically designed for ease of management out-of-the-box. IBM has invested over 1,000,000 staff-hours to date engineering this management environment, encompassing the very best of subject matter expertise with the goal of eliminating most of the time, complexity, and risk normally associated with commissioning a complex modern system environment. PureSystems Manager (PSM) is the core of this management environment.

PureApplication Server and PSM dramatically shortcut the engineering investment required to design, configure, and instantiate the technical environments required by modern architectures, such as the 3-Tier (Web, Application, Database) design of *SmartPro MedEE*. Implementing pre-configured and certified architectural and system Patterns, PureApp automatically self-configures and deploys the required Virtual Machines and fully integrated middleware required by the environment. This includes VM management, server networking, storage assignment, architectural tiering, clustering and failover, monitoring, and physical resource management. Operating System (AIX), Web and Application servers (WebSphere), Database Server (DB2), ESB (Integration Bus aka Message Broker), Service Registry (WSRR), BI (Cognos), and monitoring (PSM) are all part of this Pattern-driven pre-certified environment.

Patterns – A web Application deployment Pattern Example

- Captures decades of experience in designing, building, and deploying new business applications
- Codified best practices for presetting configuration options by type of selected Web application (e.g., high availability, high security, etc.)
- What do we do? Bring our data and application code, select a policy for the application, and everything else is handled in the background
- What do we NOT have to do? Engineer the interdependencies and connections between the database, application server, management, security, and the rest of the middleware; manually engage in extensive real-time management of the PureApplication infrastructure

Result: Speed deployment of Web applications by 20-30x!

The weeks to months of technical engineering and configuration that is normally required to prepare an environment for application installation is literally reduced to hours and days. Workload definitions, which are the instantiable environments that result from configuring a Pattern, can be instantiated within moments, copied to other PureApp servers, and can be rapidly cloned and then modified, to build other Workload definitions (Environments) based on previous work.

Once defined and instantiated, Workloads / Environments are dynamically monitored and self-tuned by PureApp and PSM according to business rules and configurations defined for the Environment. For example, a VM may be implemented to dynamically adjust its physical CPU Core allocation within a defined range to meet target resource utilization goals, without human intervention. Engineers and Operators can also adjust resource assignments on the fly through PSM, should the system monitoring tools indicate a situation that requires human intervention. PSM provides fully modern dashboards, graphical presentations, and quantitative presentations with drill-down into system technical data.

Figure IV-55 depicts the ease with which an engineer or administrator defines a highly sophisticated environment, including dynamic scaling and multiple architectural tiers.

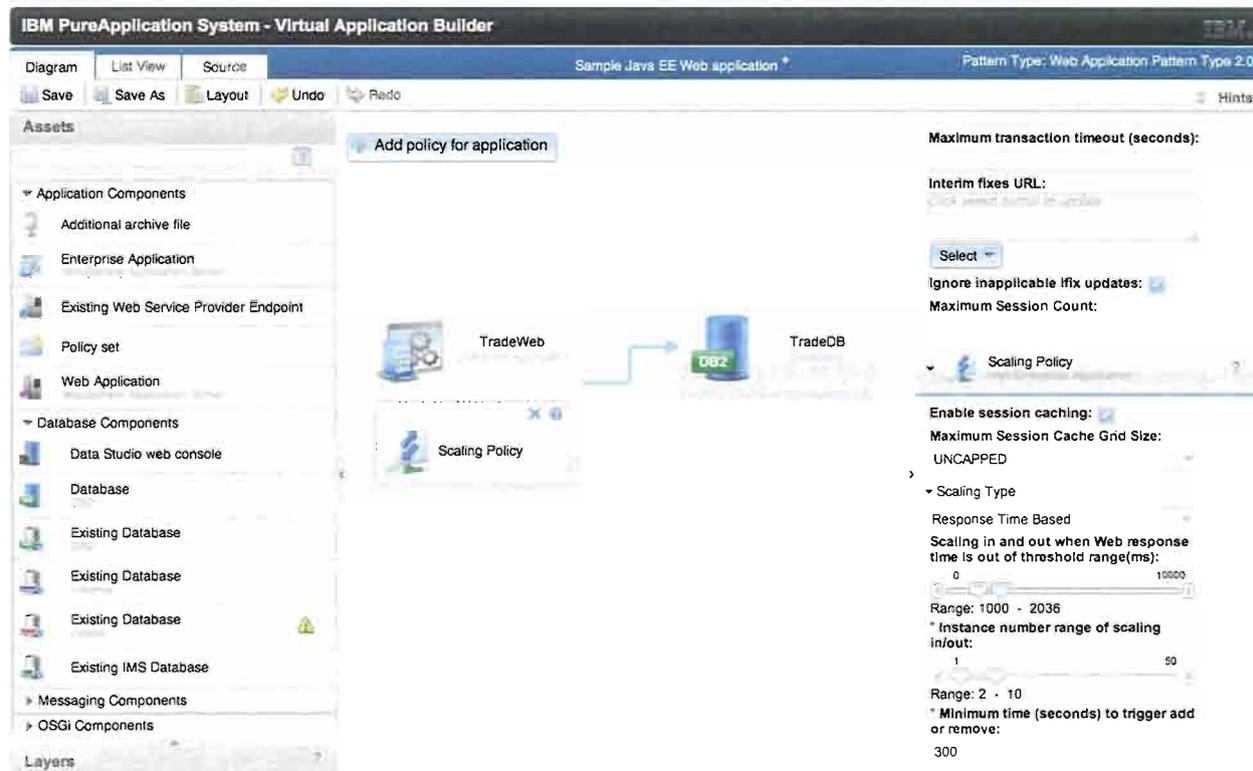

Figure IV-55: PureApplication Virtual Application Builder

d) Ability to upgrade (ease and compatibility);

Each module within the Cúram architecture is generated into an EAR (Enterprise Archive) file which includes both EJBs (Enterprise Java Bean) and Web Containers. The Cúram architecture provides a flexible deployment options by enabling horizontal and vertical scalability. Application upgrades do not require all features to be upgraded within the Cúram environment. The Wipro/IBM and Nebraska team can replace a single module or a series of modules independently so that changes

made in Cúram do not impact all functionality within the environment. Such an architecture design provides failover, load balancing, and redundancy. It also ensures constant compliance with leading practice security models including those interacting with application instances. The architecture model and the design describing the upgrade protocol are found in Figure IV-56.

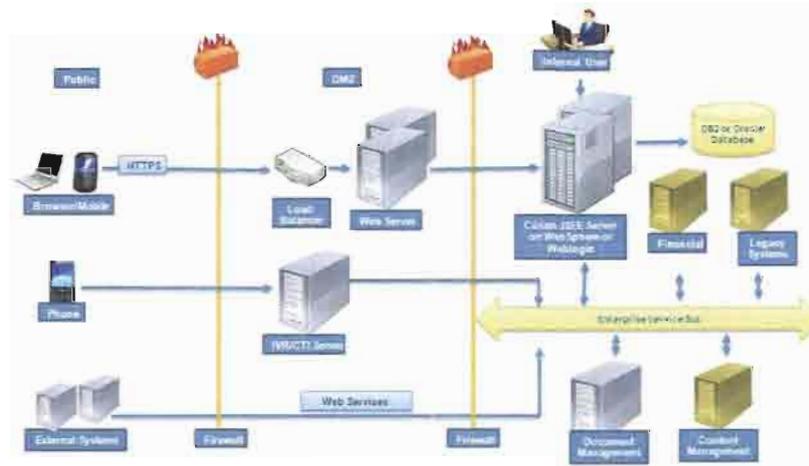

Figure IV-56: Cúram Architecture Model Describing the Upgrade Protocol.

Cúram upgrading principles are built around the concept of Dynamic Configuration. Under traditional software development lifecycle design, all components that are part of a deployment must be updated and configured regardless of how small the change may or may not be. With the Cúram dynamic configuration deployment model, a change can be made to the QA/UAT environment. Once updated, the change can be tested. Finally, upon testing and validation occurring, the production environment can be updated. The COTS-based modularity of each EAR makes the upgrade path quick to deploy and easy to manage in the Nebraska EES environment. PureApplication server is designed for ease of upgrade.

SmartPro MedEE is based on two dedicated PureApplication 1700-64 servers, one located in the Primary Data Center, the other in the Secondary Data Center. Each server has 64 physical CPU Cores (Processors), 1 TB (Terabyte) of RAM, 6.4 TB of Solid-State Disk, and 48 TB of magnetic disk Memory, all housed in a single large rack. Without taking an outage, a single rack/server may be expanded in increments of 32 Cores up to 608 CPU Cores with 9.7 TB of RAM, which may be usefully applied to workloads within minutes.

Each PureApplication Server box is entitled to unlimited DB2 enterprise Edition, and unlimited WebSphere Network Deployment, up to its physical CPU limit. These basic middleware tools are immediately available for effective use by running environments within minutes of installing the new processor Cores into the running server, without service interruption.

Though it is not expected that **SmartPro MedEE** will require more than the pre-configured ~50TB of useful disk storage in its expected lifetime, if storage needs do exceed this limit, the PureApplication Server's storage can be extended further using standard Data Center Storage Area Network (SAN) technology.

e) Virtualization and resource management;

The Wipro/IBM team employs built in virtualization technologies to simplify the requirement for multiple environments. The server technology design we use supports dynamic logical partitioning (LPAR) and shared processor micro partitions. By designing the EES platform using LPAR and processor micro partitions, the proposed application can run on multiple environments concurrently. As resource demand increases or decreases, adjustments to workload between environments as well as the reallocation of system resources to optimize performance can occur. By increasing system utilization by virtualized processor cores and memory, servers can share input / output (I/O) resources to lower costs of third-party technologies, including adapters, and increase I/O utilization. By providing a higher availability of I/O resources including storage capacity and network bandwidth, overall operational cost are reduced. This is critical for longer term maintenance and stability after system turnover.

SmartPro MedEE is hosted on an IBM PureApplication Server Appliance, which provides a fully virtualized “Cloud in a Box” implementation. All Environments, such as Production, Sandbox, Training, and QA, are instantiated as PureApplication workloads, consisting of one or more closely related VMs within the PureApp Server.

Within each **SmartPro MedEE** Environment (represented by a PureApp Workload), the VM(s) are configured and resourced based on three major considerations:

1. Security / Role in a multi-tier architecture:
 - Role (Web Server, Application Server, Database Server), and their placement within a DMZ / Secure Zone network model
 - VLAN i.e. Production vs. Non-Production
2. Availability Requirements i.e. Clustered or Non-Clustered
3. Performance:
 - Physical Resources assigned to VMs e.g. CPU Cores and Memory
 - Isolation of Workloads to minimize interference, such as separation of Business Intelligence from Operational transaction processing
 - Load balancing of multiple instantiations, such as multiple Web Server VMs.

At the high end, the Production environment makes use of all of the above: distinct VM set representing each of the 3 tiers of Web, Application, and database, for security and performance; VLAN isolation of the Production VM set from non-Production for Security; multiple clustered VMs within a tier for performance and availability; dedication VMs to isolate possibly interfering workloads, such as operational processing (Cúram) from Business Intelligence (Cognos).

At the other extreme, a small environment such as Training may institute all layers into a reduced set of VMs, without clustering, explicit separation of tiers into distinct VMs, and so forth.

The PureApp Appliance provides a remarkably easy to use hosting environment to implement these models. At its core, the PureApplication Server provides “Cloud-in-a-Box” hosting services. Complex workloads such as that described above for the Production Environment can be configured and instantiated within hours or less by merely answering a few questions. PureApplication Server

utilizes pre-defined and customizable Patterns, such as “Multi-tier Web Application”, that instantly deploy the desired architecture.

PureApp Patterns include pre-configured and certified integration of the key middleware components such as WebSphere and DB2, with an intrinsic understanding of clustering, load balancing, multiple tiers and so forth. For example, if the engineer managing setup instructs the Pattern to deploy 3 VMs for the Application tier in a multi-tier Web Application Pattern, then PureApplication Server will automatically configure those VMs (and WebSphere) for load-balancing and clustering.

The assignment of physical resources to VMs is a dynamic, and to a large degree, self-tuning exercise within the PureApp Appliance. The VM designer has the freedom to assign exact and fixed physical resources e.g. “2 Cores of 32GB each” to a VM. However, PureApplication Server also allows the designer to specify a range of resources, and allow the server to dynamically assign/design additional capacity based on utilization thresholds. For example, the previous static VM definition could be modified to read: “Assign between 2 and 6 Cores as required to keep individual CPU utilization under 60%”. PureApplication server can now flex the environment dynamically, while running the production workload, within the constraints defined. The PureSystems Manager console allows operations staff to continuously inspect and understand the server’s status, via alerts, graphical displays, and dashboards. If the server cannot self-maintain performance targets within the constraints configured into the Environment, then higher-level alerts are forwarded to the Enterprise Data Center management suite, triggering human intervention. Within the physical limitations of the server box, human engineers can analyze the running Environment and assign additional resources on the fly as required to meet performance targets.

f) Network Performance Requirements:

Network connectivity varies depending on the user type and system that the user type must connect to. The network performance requirements; therefore, vary based on role and environment. As a best practice, the Production environment should connect to live legacy systems whereas the System Test, Integration Test, QA/UAT, Training, Sandbox, and Staging environments should connect to staging or test legacy systems where available for simulation of live environments. The Data Conversion environment should connect to one or more file transfer servers for exchange of prepared conversion extracts from the existing one or more legacy applications. Connectivity to the new environments from the roles should be accomplished through WAN/VPN or LAN only connection as shown in Table IV-13 below.

Table IV-13: Recommended Network Performance Design

Environment	Develop Access	Admin Access	Security Compliance
Development	WAN/VPN	LAN	WAN/VPN, LAN
System Test	WAN/VPN	LAN	WAN/VPN, LAN
Integration Test	WAN/VPN	LAN	WAN/VPN, LAN
QA/UAT	WAN/VPN	WAN/VPN, LAN	WAN/VPN, LAN
Data Conversion	WAN/VPN	WAN/VPN, LAN	WAN/VPN, LAN
Training	None	LAN	LAN

Environment	Develop Access	Admin Access	Security Compliance
Sandbox	None	LAN	LAN
Staging	None	LAN	LAN
Production	None	LAN	LAN

Network performance metrics and thresholds for each of these environments in conjunction with the Wipro/IBM team will be documented and agreed upon as part of our service level agreement (SLA).

The Data Centers’ network devices, such as routers and firewalls, continuously forward performance and management data upstream to the Enterprise Management Environment. Computer Associates’ Spectrum 8.0 and eHealth tools coordinate to capture this raw data, apply configured business rules to trigger required alerts, and to maintain, organize, and present current and historical performance data to both Data Center and authorized State staff.

Network capacity is continuously monitored; along with the hardware components they constitute the Data Center’s network fabric. Bottlenecks are detected, and when warranted, action plans developed to modify capacity and organization to maintain compliance with State SLR agreements.

g) Meeting System response time requirements; and

SmartPro MedEE has been architected for both horizontal and vertical system scaling. As the user population increases, more infrastructure resources can be applied to the system to meet the input and output data demands of the citizen, case worker, or designated State of Nebraska user. As data, business rule, and workflow demands changes over time, the system being proposed for the State of Nebraska is designed so that point applications can be modified without impacting all EES enterprise systems. While downtime for routine maintenance is an expected part of any technology deployment, the Wipro/IBM team has designed the solution architecture to ensure rapid change management controls are enforcement, optimal system uptime can be met, and consistent performance is experienced as the end-user population scales over time.

PureApplication Server’s PureSystem Manager plus IBM ITCAM monitor *SmartPro MedEE*’s system response times, and forward SNMP alerts to the Data Center’s Enterprise Monitoring environment when response times exceed configured thresholds as agreed to with the State. The Enterprise Monitoring Environment combines Computer Associate’s Spectrum 8.0, eHealth, and Service Desk modules to automatically:

- Open a trouble ticket when warranted;
- Alert appropriate Data Center staff, initiating problem resolution
- Update trend analysis and other performance reporting data that is available to both Data Center staff and to authorized State staff through the ticketing portal

Additionally, PureSystem Manager executes configured self-tuning rules when it notices resource utilization beginning to exceed configured parameters. For example, an Application Server VM that is running at too high CPU utilization will be automatically augmented with additional physical CPU resources pursuant to configured rules, to manage performance towards target goals.

h) Data dashboard capabilities to facilitate real time graphical display of technology performance metrics with drill-down capability aligned with IT Operations user’s role and permissions.

Both PureSystems Manager and Computer Associate's Enterprise Management tools provide extensive dashboard, graphical, and drill-down capabilities into system and environmental performance – both current and historical.

ii. Describe the approach to providing a highly available system. The Contractor is responsible for delivering a cost-effective, high-availability environment that minimizes the frequency and impact of system failures, reduces downtime, and minimizes recovery time in the event of catastrophic failure.

SmartPro MedEE is built upon IBM's PureApplication Server, a fully integrated "Cloud-in-a-Box" appliance that is specifically engineered for high-availability applications, both in its hardware, middleware, and application deployment design. PureApp hosts a fully virtualized environment, with Workloads / Environments dynamically assignable to any of the physical resources housed in the server. PureApplication server provides:

- Fully redundant hardware, avoiding single points of failure (power supplies, processors, busses, network interfaces, storage)
- Robust internal storage, mixing both Solid State and Magnetic Disk devices in selectable RAID configurations
- Out-of-the-box support for fault-tolerant redundant multi-tier web architectures, supporting multiple nodes, clustering, and load-balancing: without detailed engineering / configuration
- Automated failover of failed Virtual Machines

Within each Data Center, the network fabric is a fully redundant design encompassing multiple outside data connections, redundant routers, firewall, and load-balancers.

SmartPro MedEE is implemented across two Wipro Data Centers for Disaster Recovery. While **SmartPro MedEE's** Production Environment only executes in a single Data Center at one time, as long as both Centers are available, the Production Environment transmits its database log transactions in near real-time to the backup, which immediately applies the updates to a shadow copy of the production database, in a scaled-down environment. Should a disaster befall the Primary Data Center, the recovery copy can be instantiated within less than an hour in the Secondary Center, working off of the shadow database copy with little or no data loss.

The Production Environment is implemented with clustered / redundant server tiers. Both PureApplication Server and a combination of ITCAM and the Data Center's native Enterprise Management Suite continuously monitor all levels of system availability, resource utilization, and performance. Almost all failures are automatically recovered without human intervention by the redundant hardware and architectural design.

Should hardware upgrades to the PureApplication Server become necessary, such as adding additional physical CPU Cores, these additions can be made without shutting down or negatively impacting the functioning system.

A key aspect of achieving cost effectiveness is sharing of resources in the virtualized environment, both within each Data Center, and across Data Centers. Each of the two PureApplication Servers, Primary and Secondary, is identical in configuration. Each server is configured with a balanced workload, so both servers provide value on a daily basis. For example, the Primary server hosts the Production Environment, System Testing, Integration Testing, and Data Conversion. In aggregate, this workload mix makes effective use of the box, while retaining room for capacity growth.

Meanwhile, the Secondary server hosts the Production log file Environment, Sandbox, Training, Development, Tools, and either a small QA (UAT) or large QA (Load / Stress / Performance Test) Environment.

The dynamically tunable virtual environment allows the PureApp server to automatically configure physical resources to meet performance requirements, including transient peaks. For example, additional CPU Cores can be automatically assigned to Production Web, Application, or Database Servers as needed to meet dynamic performance peaks – borrowing first from spare resources, and ultimately from Environments with less priority, such as System Test. This dynamic allocation of virtualized resources makes a significant overall improvement in the overall costs, including both capital costs for the environment, and in engineering and operational costs associated with operating and optimizing the environment.

iii. Describe the approach to planning, sizing and controlling the system as

IT Component Capacity needs change:

- a) Data Base Storage Capacity;
- b) Real-time Integrated/Centralized Database;
- c) Data Warehouse and Data Marts;
- d) User Capacity;
- e) Network Capacity;
- f) Server Capacity;
- g) Knowledge Base; and
- h) Document Repository.

iv. Describe the methodology for monitoring and reporting system performance, as well as the approach to Technology Management. This includes the methods for centrally managing system resources such as servers, backup, archiving, and recovery equipment, databases and applications. Address methods for auditing, tracing and scanning the system. Provide details on the use of specialized tools the Contractor will use to automate and track monitoring and management Activities

The overarching approach taken by *SmartPro MedEE* for planning, sizing, and controlling capacity is based on a closed loop model. The process starts with estimating the basic Business Drivers, such as projected numbers of users, transaction, and data volumes, and their projected growth rates. These drivers then feed the Capacity/Sizing model, converting Business metrics into sizing estimates. Business Drivers and Resource Utilization / Performance are then continuously monitored. Based on the monitoring data, discrepancies in the models are corrected: for example:

- Is Business Volume growth tracking the model estimates for growth rate?
- Are resource utilizations levels consonant with the measured Business Volumes?
- Is Performance matching expectations based on the Business drivers and Resource Utilization?

Keeping these models accurate is important to forward planning. In addition to data garnered from the live Production Environment, we have configured a complete QA – Load / Stress / Performance Test environment that fully mirrors the Production Environment's physical resources, software, and configuration. Our test simulation tool environment allows us to fully simulate realistic performance loads to calibrate our understanding of expected real-world system performance.

With calibrated models in hand, forward planning can be realistically conducted for sizing any and all of the systems components. Simple transactional growth is the easiest to plan for, as the stress/performance test environment produces a highly dependable set of models, cross-checked by experience with the Production Environment. New functionality and design is also stress and performance tested, and models corrected as required if testing produces discrepant results.

The dynamically scalable environment provided by PureApplication Server goes a long way in isolating the running environment from transient, unpredicted peaks. The system itself will dynamically assign additional physical resources based on policy rules and configuration, to maintain target levels of utilization and performance. Providing additional Compute resources, either automatically, or by human intervention, does not require a service interruption. In fact, additional physical hardware (CPU Cores and Memory) can be added to a fully functioning PureApplication server box without interrupting its service, and the new resources made immediately available to executing workloads and environments.

System Performance, Solution Availability

At the core of *SmartPro MedEE*'s monitoring and management model is IBM's PureApplication Server Appliance, and its embedded management tool, PureSystems Manager. In a single highly unified environment, PureApplication Server combines high performance server capacity (64 cores of Power+ 750 CPUs), Storage (~50TB, mix of solid state and magnetic disk), Operating System (AIX), Database (DB2 Enterprise), Application Server (WebSphere Network Deployment), Monitoring and Management (PureSystems Manager), plus full virtualization, including VM management. *SmartPro MedEE* and PureApp also includes pre-configured Patterns for integrated deployment of the ESB (Integration Bus aka Message Broker), Service Registry (WSRR), and Business Intelligence (Cognos).

PureApp Server delivers out-of-the-box configurability and manageability of Virtualized Environments via its PureSystems Manager tool (PSM). PSM directly provides most of the performance monitoring and management normally associated with complex data center operating environments. Additionally, PSM and PureApp Server will forward alerts upstream to the Data Center's Enterprise Management environment, should human intervention or notice be required.

e. Technical Components

The *SmartPro MedEE* solution is based on a Service-Oriented Architecture and is enabled by industry leading software applications from IBM. Software that is key to making the *SmartPro MedEE* application SOA-based includes:

- IBM WSRR - Distribution of Services is enabled by the WebSphere Service Registry and Repository (WSRR), which provides clear visibility into distributed service associations while enabling governance across platforms of the entire services lifecycle through true end-to-end repository federation to provide multi-data center implementation of the environment.
- IBM Integration Bus - Interfaces between components and with external components is enabled by the IBM Integration Bus (IIB) which enables SOA standards-based

communications and allows you to connect virtually any application or service over multiple protocols including SOAP, HTTP, Java Message Service (JMS) and more.

- Web Service-enablement - *The SmartPro MedEE* components are SOA-enabled by way of:
 - The Cúram COTS package that delivers the core eligibility and enrollment function is SOA-enabled. The Cúram toolkit allows any business function to be exposed easily as a service, generating the necessary artifacts such as WSDL. It also allows Cúram to easily consume web services.
 - IBM InfoSphere Master Data Management product communicates with its providers and consumers via Web Services
 - IBM Cognos provides access to its functionality via the Cognos SDK, a toolkit you use to extend and customize IBM® Cognos® reporting products as Web services.
- The Wipro/IBM design and development approach is SOA-centric in identifying and implementing services and using the SOA infrastructure to connect and orchestrate service providers and consumers.

The graphic below depicts the overall *SmartPro MedEE* solution, and how the SOA-based and layered approach separates business functions allowing for loose coupling, yet high cohesion between software components within the enterprise.

This approach insulates the Department from costly changes due to policy directives from federal and state policymakers.

Nebraska's Enterprise-ready Medicaid Eligibility and Enrollment System

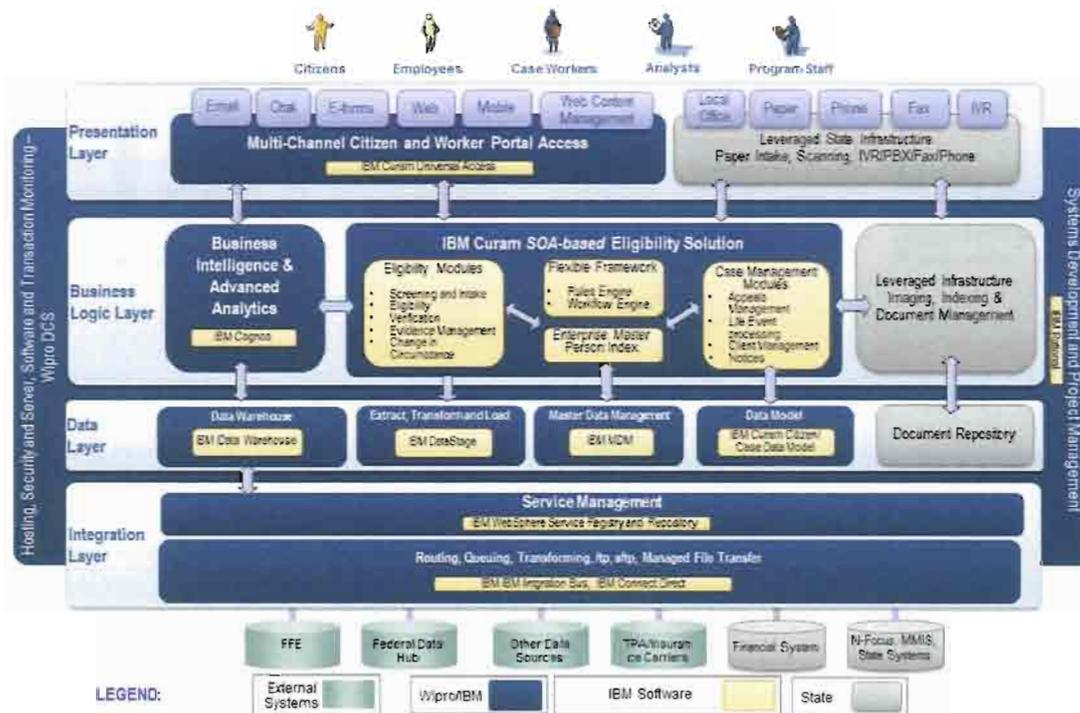

Figure IV-57: *SmartPro MedEE* is SOA-Based and Architected for the Enterprise

We are excited to bring our *SmartPro MedEE* solution to the MLTC. Our solution is based on proven technology and years of research and takes advantage of enabling architecture at every level to decrease maintenance costs, improve flexibility and expand meet other business needs within the Department.

The *SmartPro MedEE* solution is based on highly available fault tolerant redundant open systems appliance – IBM PureApp. There will be one appliance in each data center – Primary and Disaster Recovery.

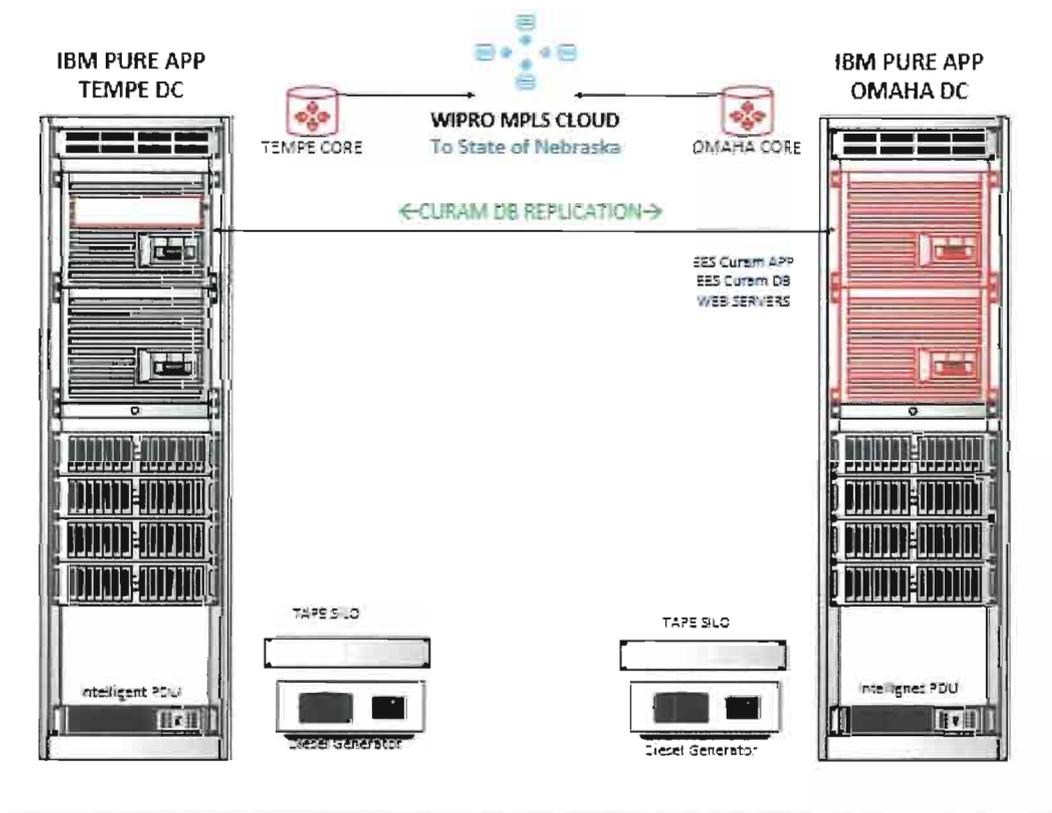

Figure IV-58: Nebraska's Eligibility Solution – Cloud-Like, Flexible, Highly Available

In the narrative below we provide additional detail regarding our enterprise-ready and SOA-based solution.

- i. Describe the approach to meeting the Enterprise Service Bus (ESB) requirements as well as the messaging approach for server-to-server and client-to-server communications, if applicable. The approach, at a minimum, must take the following topics into consideration while providing the details:
 - a) SOA Architecture;
 - b) Integration Mechanism;
 - c) Routing and Orchestration Mechanism;

- d) Synchronous and Asynchronous Communication;
- e) Reliability of Message Delivery;
- f) Support for Industry Standard Messaging and Interfaces; and
- g) Administration and Security.

Using the IBM Integration Bus, the *SmartPro MedEE* solution will provide Nebraska with an Enterprise Service Bus that supports advanced policy-based workload management, business rules, and integration with IBMs Process Server. As a best-in-class Enterprise Service Bus, IBM Integration Server supports all of the features described in the requirement above.

As MLTC works towards rationalizing their IT architecture, the IBM Integration Bus will allow systems that were previously “wired together” to be loosely coupled. This allows MLTC to adopt a component-based approach to software procurement. Instead of building and maintaining monolithic applications, a modularized architectural approach allows the department to make use of purpose built COTS products that integrate seamlessly with the rest of the enterprise using the IBM Integration Bus.

Wipro has implemented ESB architecture in our Missouri Medicaid implementation. This architecture is allowing us to more quickly and easily upgrade systems, due to the buffering that a Service Bus affords, as portrayed in the diagram below.

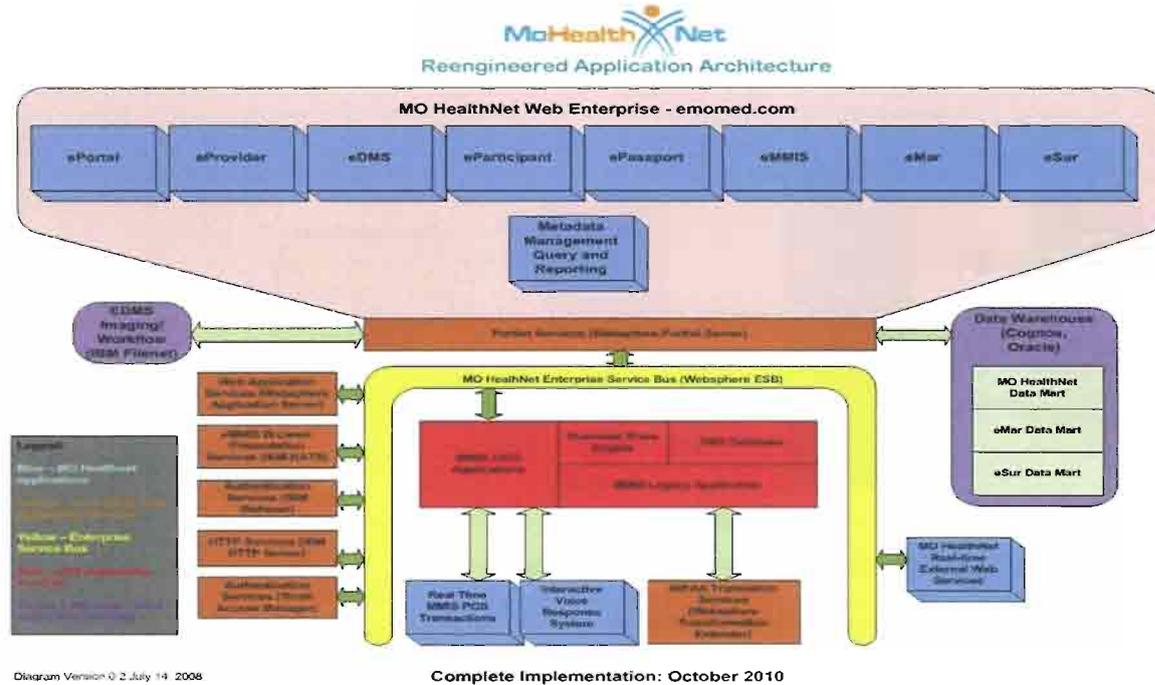

Figure IV-59: Wipro’s Missouri Medicaid Operation Utilizes an IBM Enterprise Service Bus

ii. Describe the approach to Data Integration and supporting technologies for Data Extraction, Transformation and Load into appropriate target systems.

The State of Nebraska's requirement for Enterprise Data Management is to have a mixture of OLTP, Operational Data Store (ODS), Data Warehouse, and Data Mart technologies that support transaction processing systems, information integration and reporting, enterprise analysis and decision support, and functional analysis.

The design approach for the EES must take into account the following four major types of shared data:

- a) Online Transaction Processing (OLTP) databases must be the read-write stores of the Department's transactional services and systems, and must be the primary point of data creation within the Department;
- b) Operational Data Store (ODS) databases should be used to support operational and tactical data consolidation and data access needs of the Department. The data contained in an ODS must originate in one or more OLTP databases;
- c) Data Warehouse databases should primarily support managerial and strategic decision making for the Department. A data warehouse may contain summarized data rather than detailed data as in an ODS; and
- d) Data Mart databases should support departmental decision making for the Department. The scope of information stored within a data mart should be generally much smaller than within a data warehouse, and is limited to the needs of its audience.

To support MLTC's ETL requirements, the *SmartPro MedEE* solution includes another industry-leading suite of ETL tools from IBM's InfoSphere brand. InfoSphere DataStage extracts data from the Cúram and other peripheral applications to populate the *SmartPro MedEE* data warehouse. IBM InfoSphere DataStage® Extracts, Transforms and Loads the data contained in the *SmartPro MedEE* eligibility and enrollment application to the *SmartPro MedEE* data warehouse. The Wipro/IBM team will model the data mart in such a manner that most complex transformations, summary tables etc. are created at the data mart level itself. Data marts will be scalable to allow data from other sources to be integrated to meet additional reporting requirements.

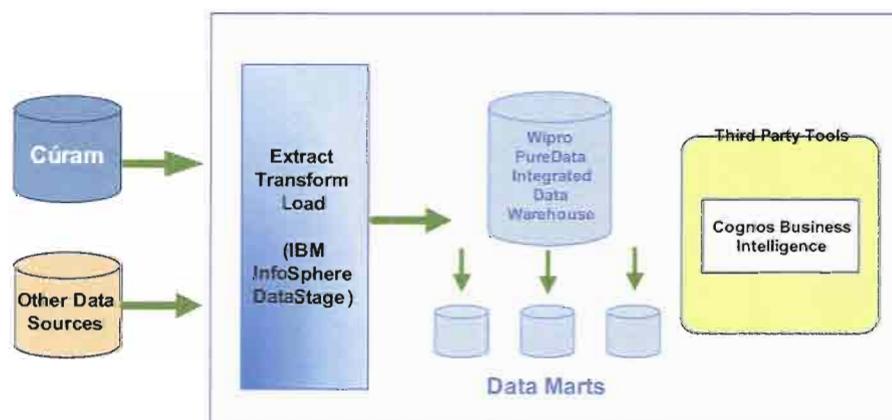

Figure IV-60: Reporting Architecture (High Level)

- iii. Describe the approach to implementing the MDM technologies to build a Master Client Index/Enterprise Master Person Index to meet the Department's requirements in each phase of the implementation;

As described in our response to "Understanding Project Requirements" above, Wipro/IBM considers Master Data Management (MDM) as a foundational architecture component that allows the department to see across silos to better serve their plan participants. Currently, participant services are offered without respect to whether or not they may be receiving care from another state, federal or private organization. This means that services are duplicated, resulting in higher costs, and potentially outcomes that are suboptimal.

With understanding the importance of single version of Masters (Person, Provider), overarching Data Governance, and underlying Data quality needs for Nebraska's EES, Wipro/IBM proposes IBM InfoSphere (Initiate) as MDM solution.

Our approach to building the Master Client Index/Enterprise Master Person Index is to fold the discovery and requirements gathering process into the *SmartPro MedEE* SDLC processes to understand specific MDM requirements and then build an MDM solution that provides the most value to the Department. Initially, we envision that the scope of the MDM project will be contained a few programs, and will grow over time, as the Department and the Wipro/IBM team gain consensus regarding how to prioritize MDM integration activities across the enterprise.

iv. Describe the Security Architecture and Management approach supporting the EES;

As mentioned previously, Wipro maintains a dedicated information security team for Wipro's Government Healthcare business unit, led by a certified Information System Security officer. Using the baseline security policies and procedures as a starting point, the healthcare security organization works with the *SmartPro MedEE* team to extend and customize these requirements to meet the specific needs and requirements of the MLTC in support of their participants, state staff and other stakeholders.

The resulting System Security Plan is baseline and placed under configuration management. As components change within the *SmartPro MedEE* solution, the System Security Plan is updated to reflect these changes. For example, if mobile applications are introduced for field staff, then the Security Plan is updated to reflect the new security risks related to the use of these devices.

Our approach to Security Architecture is layer-based, as we address security at the physical, data center/raised floor level, network level, server, operating system and application level.

From a user-identification perspective, Wipro/IBM *SmartPro MedEE* provides for positive user identification through two paths, one for internal users and the other for external. For internal users, *SmartPro MedEE* will utilize the State's Microsoft Active Directory implementation as the source of truth for User Authentication. External Users (citizens) are managed by Cúram's internal user directory, based on positive identification. Once authorized, Cúram maintains the mapping of users to roles, the basis of *SmartPro MedEE* solution's RBAC security design.

v. Describe the approach to the Business Intelligence (BI) platform that should deliver a balanced set of capabilities across three areas: information delivery, analysis, and development and integration with certain fundamental capabilities that need to be provided as part of the shared analytics and a user-driven BI strategy;

vi. Describe the Reporting approach for both canned and ad-hoc reports and the ability of the proposed solution to provide Dashboarding capabilities. The approach, at a minimum, must take the following topics into consideration while providing the details:

- a) BI Infrastructure;
- b) Scalable Data Architecture; and
- c) Data Integration Tools.

The IBM/Wipro team uses the Cognos and InfoSphere suite of tools to provide easy-to-use reporting capabilities to MLTC. The Cognos tool set includes Cognos Query Studio, Cognos Event Studio, Cognos Analysis Studio and Cognos Metrics Manager, The InfoSphere solution set includes DataStage which is used to Extract, Transform, and Load all of the data required for reporting and

analysis. These tools work together seamlessly are accompanied by support from the Wipro/IBM account team to train users to leverage these tools as much as possible.

The BI environment supports report delivery in multiple access channels including web, email, and standard office tools (PDF, Excel, etc.). Cognos also includes functionality to provide automated delivery of reports.

If the state so chooses, the BI environment can integrate with the state's advanced analytic engines, like SPSS and SAS.

A semantic layer is created using Framework Manager as a part of *SmartPro MedEE* development project. The availability of a semantic layer allows end users to create queries and reports without having to have a highly detailed understanding at the data model data element level. The same semantic model can be published in the BI portal for the power users and can also be leveraged to create ad hoc reports.

The framework model is designed with the understanding that the data source source of data is the data mart. Multiple Framework manager models /packages are built to support the State's business areas including:

- Program Reporting
- Member/Participant Reporting
- Utilization and Program Integrity Reporting
- Management Reporting

The *SmartPro MedEE* solutions BI environment is portrayed in the diagram below.

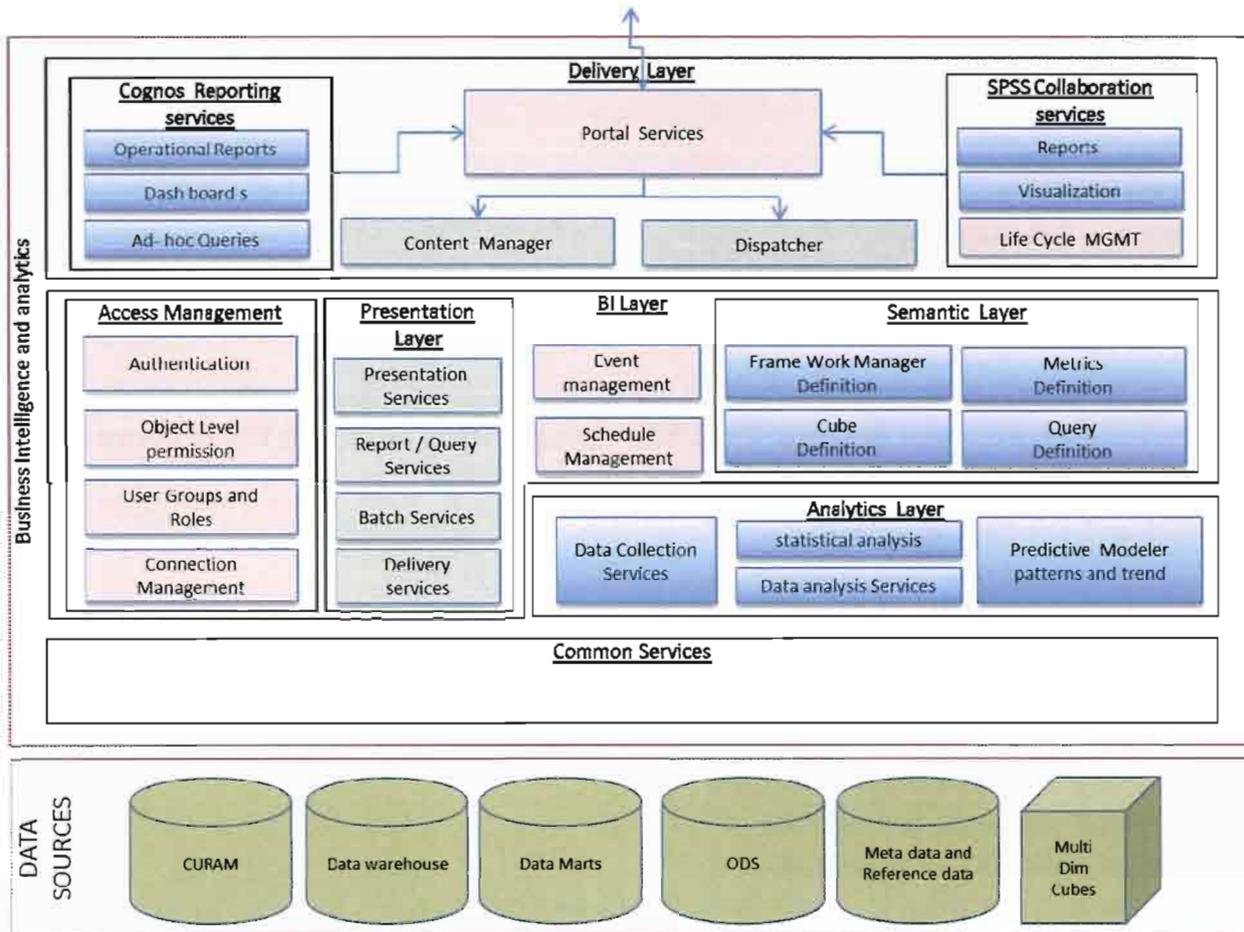

Figure IV-61: Information Delivery Architecture (Detailed)

- vii. Describe the Business Rules Engine technology that will enable and support the EES for both Integrated Eligibility as well as support of other programs;
- viii. Describe the approach the following topics that must be taken into consideration while providing the details:
 - a) Rules Engine Architecture;
 - b) Validation, Calculation, Decision and Generation Rules;
 - c) Performance Tuning and Debugging; and
 - d) Rule Storage and Versioning.

The IBM Cúram Rules Engine includes the IBM Cúram Express Rules (CER) environment for rules editing and execution. CER provides a highly versatile and adaptable rules environment that supports the definition, creation, testing, and execution of rules in support of a range of business functions both within and outside of the *SmartPro MedEE* system, such as screening, workflow, work allocation and of particular importance for MTLC, support for determining eligibility. CER also supports entitlement (payment) calculation as required for Financial Assistance programs.

CER consists of the following key components and functions:

- CER Rules Language

- CER Engine
- CER Editor
- CER Rules Search
- CER Rule Doc
- CER Decision Summaries
- CER Test Infrastructure
- CER Medical Eligibility Vocabulary

CER Rules Language

CER is an XML based rules language that enables the creation of domain specific rules vocabularies in support of a range of business functions. The CER language consists of building blocks known as expressions. CER Expressions are organized into the following groups:

- Boolean Logic (true, false, not)
- Value Comparison (equals, compare, sort)
- Constants (true, false, null, String, etc.)
- Conditional Logic (choose)
- List Aggregations (all, any, sum, min, max, concat, etc.)
- List Transformations (dynamiclist, fixedlist, filter, sort, etc.)
- Numerical Calculations (sum, max, min, etc.)
- References (reference, current, this)
- Timelines (Interval, Timeline, Era)
- Household Composition (currentunitmember, financialunitcategory, householdcomposition, mandatorymembers, mealgroupmembers, relatives, etc.)

CER Rules Expressions operate on “Attributes.” An attribute has a type (e.g. Money, Number, Boolean) and a derivation. The derivation is a combination of Rules Expressions that calculate a value for the attribute. The derivation can be based on data from the database, data from remote systems accessed via web services, or other attributes that are further calculated using CER Rules Expressions. An attribute is equivalent to a 'word' or a 'term'. Multiple 'words' or 'terms' for a specific business domain make up a vocabulary.

CER Rules Engine

The CER engine is a Java based rules engine that executes CER rules on demand at runtime. When run, the rules engine first loads a date relevant version of a specified rule set. It will then start a CER session, so as to isolate multiple simultaneous executions from each other. Finally, it will attempt to evaluate the requested attribute, triggering that attribute's derivation, which will further trigger lower level attribute derivations and so on.

In line with MITA guidelines, the CER rules engine can and will be made available through SOA-based web services to enable wider adoption within DPA.

CER Editor

Given that the goal of CER is to support business rules users in creating and maintaining rules, a business focused façade must be provided that abstracts away complexity and presents an intuitive user experience.

The CER Editor provides an online graphical user interface for dynamically creating and maintaining CER rules. It enables a business rules user to draw a set of rules diagrams, and to enable/disable existing rules, without programmer intervention, using an intuitive drag and drop approach. A rules diagram represents the derivation of an attribute and so a rules diagram is a graphical representation of CER Rules Expressions.

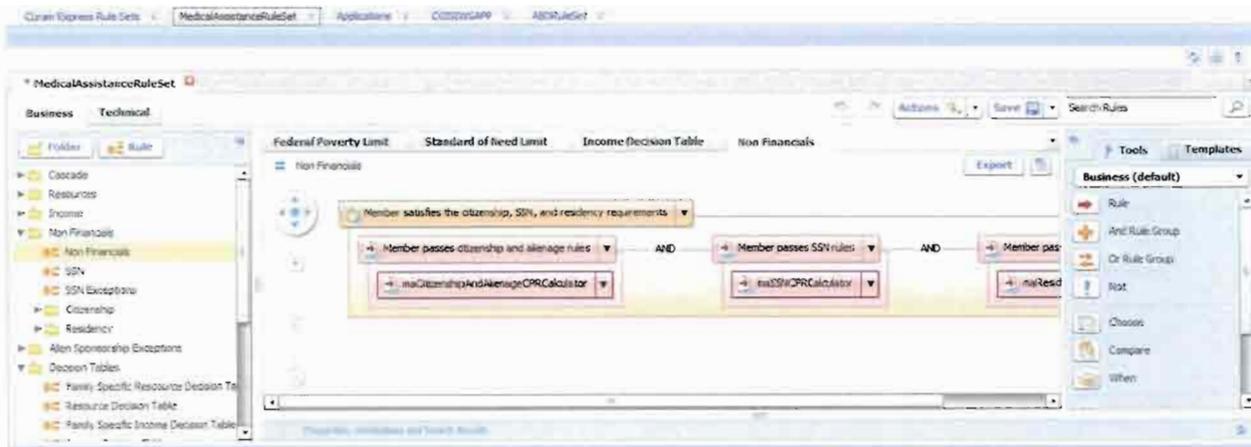

Figure IV-62: The CER Editor, with Rules Diagram

An alternative representation of a rules diagram is presented in Figure IV-63: A Decision Table is presented to the user when an attribute derivation is best represented as a lookup table.

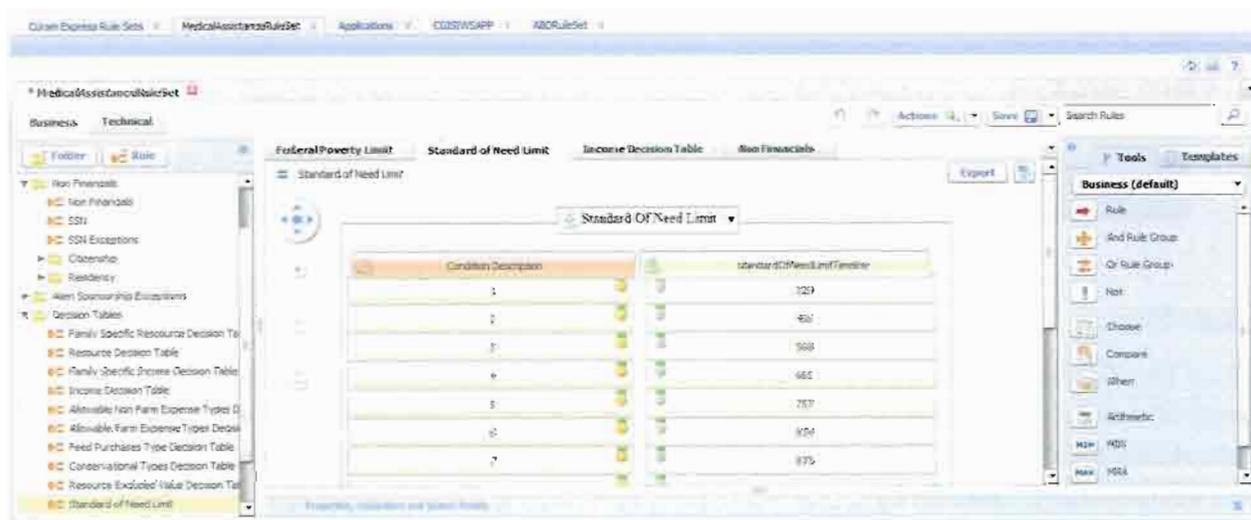

Figure IV-63: The CER Editor, With Decision Table.

The CER Editor enables a user to create a new rules diagram, modify an existing diagram, validate a rules diagram, save rules to the database, export rules to an external XML file, and import rules from an XML file. Rules export and import supports a more technical rules developer in creating

and maintaining rules directly as XML. The CER Editor also provides a comprehensive Rules Search function.

CER Rules Search

The CER Rules Search function enables the user to search for text in a rule set. Depending on the filters selected, the search function will look for the input search criteria within rules, within references to rules from other rules diagrams, within all descriptions, within folder names, and within any technical and code table data.

If the user clicks on a link under the 'Item' column, the search window closes and the relevant rules diagram is displayed in a new tab in the editor.

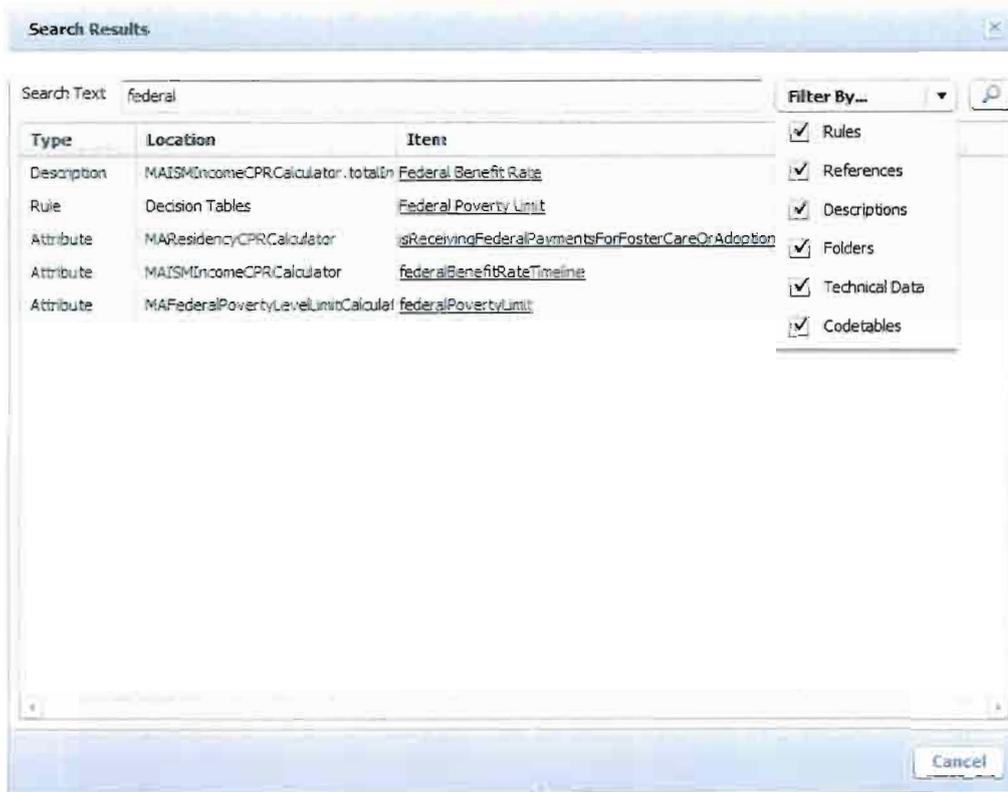

Figure IV-64: The CER Rules Search Function

CER Rule Doc

CER Rule Doc (akin to JavaDoc) is a HTML representation of a CER-based vocabulary. It is a dictionary of words (i.e. attributes) in the vocabulary. Inter-linked HTML pages enable the user to understand how an attribute is derived from other attributes and view dependency relationships between all attributes (Figure D-7.)

CER Decision Summaries

A Decision Summary is a configurable explanation of a rule set execution. It presents coherent high level and intermediate calculations, down to a level that is determined useful to a business user or client, to explain an eligibility determination.

The screenshot displays a 'Household Income' summary with the following data:

Category	Sub-category	Amount
Gross Income	Total Gross Income	\$655
	Gross Income Limit	\$843
	Gross Income Test	Pass
Member Income	Income Type

Figure IV-66: CER Decision Summary

CER Test Infrastructure

Rules testing is fundamental to the success of rules creation and maintenance. The CER Test Infrastructure provides support for unit testing (individual unit tests and batch unit tests), regression testing, and test coverage. End-to-end rules testing is also supported through these basic test types.

Unit testing is a method by which individual units of logic are tested to determine if they are fit for use. A unit is the smallest testable part of a rule set. A key part of unit testing is being able to test an individual unit of logic in isolation of other units of logic. Because CER Rules are a collection of derivations, where each rule is derived either from data or from other rules, it is necessary to have a mechanism for providing test data to pre-populate dependent data.

This ability to allow tests to 'specify' values, which would normally be calculated, becomes increasingly useful as rule sets grow to implement additional functionality. It is much easier to test many possible results for a particular rule calculation if you only have to worry about its direct inputs. CER provides such a mechanism, thus ensuring unit tests can be set up that are focused on testing a known and limited set of rules. Multiple, lower level, individually proven unit tests can be set up as a higher level "unit" for testing. This practice enables unit tests to cover a wider scope.

Whenever M2E CMC executes a unit test the CER Test Infrastructure will output HTML documentation to verify the execution. When used in conjunction with the tests, this documentation output is a powerful debugging aid.

Created Externally

Attributes

Figure IV-67: Rules Trace Output

The Wipro/IBM team will implement the IBM Cúram Rules Engine, which includes the IBM Cúram Express Rules (CER) environment for rules editing and execution. CER consists of the following key components and functions:

- CER Rules Language
- CER Engine

- CER Editor
- CER Rules Search
- CER Rule Doc
- CER Decision Summaries
- CER Test Infrastructure
- CER Medical Eligibility Vocabulary

CER provides a highly versatile and adaptable rules environment that supports the definition, creation, testing, and execution of rules in support of a range of business functions both within and outside of the *SmartPro MedEE* system.

Unit testing is a method by which individual units of logic are tested to determine if they are fit for use. A unit is the smallest testable part of a rule set. A key part of unit testing is being able to test an individual unit of logic in isolation of other units of logic. Because CER Rules are a collection of derivations, where each rule is either derived from data or from other rules, it is necessary to have a mechanism for providing test data to pre-populate dependent data.

Whenever a unit test is executed the CER Test Infrastructure will output HTML documentation to verify the execution. When used in conjunction with the tests, this documentation output is a powerful debugging aid.

retirementCause	java.lang.String	SPECIFIED	Retirement Fund	Specified Externally	None	ageAtRetirement								
yearOfBirth	java.lang.Number	SPECIFIED	1980	Specified Externally	None	yearOfRetirement								

Figure IV-68: Rules Trace Output

The CER Test Infrastructure also accommodates batch unit tests. This is the capability that the *SmartPro MedEE* solution will use to conduct regression testing. Regression testing's purpose is to uncover why and where problems occur whenever logic, which previously worked as desired, stops working or no longer produces the same (correct) result or output.

Test coverage tracks the percentage of rules logic that is covered by unit testing. This color-coded report highlights the completeness of implemented unit tests.

Figure IV-69: Test Coverage Report

ix. Describe the approach to using the Portal technologies to enable access for the variety of internal and external end users of the proposed solution. The approach, at a minimum, must take the following topics into consideration while providing the details:

- a) Multiple Channel Support;
- b) Search Capabilities;
- c) Accessibility considerations;
- d) Personalization; and
- e) Usability best practices and federal guidance.

SmartPro MedEE is comprised of three primary application components: IBM Cúram for Eligibility and Enrollment; Cognos for Business Intelligence; and LifeRay for general Portal functionality. LifeRay is a feature-rich portal that supports multi-channel support, search capabilities, accessibility, and personalization. Usability best practices and federal guidance are also considered within the LifeRay portal.

To support multi-channel support, LifeRay integrates with the Wireless Universal Resource File. This integration allows the portal to sense what type of device (Desktop, Mobile Device, Tablet, etc.) is being served web content and then renders web content that is tailored specifically to that device. In addition to LifeRay's native multi-channel support, as a Value Add in our proposal, IBM/Wipro is offering to provide mobile application support from Diona. Diona applies "mobile-first" principles to provide anytime/anywhere access to social services information and eligibility by providing a new system of engagement (SOE) that integrates with existing systems of records (SOR). As a health and human services specific mobile solution, Diona GEM employs an innovative, vertical specific, mobile user experience (UX) paradigm that enhances usability and meets citizen and agency

employee expectations of modern engagement with government. Díona GEM is designed to leverage mobile technology elements such as wireless access, GPS navigation, on-device camera, and scanners, bringing productivity gains for agency staff and enabling more self-service options for citizens and service providers.

Search functionality within LifeRay can be accomplished using multiple search engines. Apache Solr is an open source search engine that is easily integrated with LifeRay to provide feature-rich search capabilities. LifeRay can also be integrated with a Google Search Appliance and other common search engines.

LifeRay also supports personalization based on group and other attributes. Calendars, events and other portal widgets can be personalized and designed to display different information based on the role of the user.

x. Describe the Application Server technology and approach supporting the EES. The approach, at a minimum, must take the following topics into consideration while providing the details:

- a) Enterprise Ready and Scalable;
- b) Clustering;
- c) Store-and-Forward;
- d) Administration; and
- e) Security.

The *SmartPro MedEE* applications' web applications execute on IBM's WebSphere Application Server. WAS is an industry-leading application server that is proven in the enterprise, scalable, and fault tolerant using clustering. WAS also supports Store and Forward technology using WebSphere Integration Developer. This capability enables an application, granular administration capabilities, and security that support the ability for the *SmartPro MedEE* solution to meet HIPAA and PCI (if needed) Security requirements.

WAS supports hardening against Network-based attacks, Machine-based attacks, and application-based attacks, both internal and external.

xi. Describe the approach to database management, metadata management, load balancing and/or clustering for extended scalability and performance, performance in transaction processing and report processing, Security and Audit;

Data backup, retention, and disaster recovery are integral to any enterprise level solution. Wipro/IBM employs an extremely rigid and verifiable process of daily, weekly, and monthly data/environment backups. State of the art LTO5/6 tape libraries are used to backup many hundreds of Terabytes in our data centers. For the EES system, the solution utilizes both data replication between data centers and local tape backups of specific systems, each night. Retention of daily tapes will be held onsite at the local data center for the first 7 calendar days after use. They are then taken to an offsite retention facility and stored for the remainder of the duration that is required to adhere to Federal, State, local or customer requested data retention policies/guidelines. The offsite tapes can be recalled 24/7/365, in the event the required data to be restored cannot be obtained on tapes stored at the data center.

The EES Production database, restore point logs as well the AIX OS server environment settings will be replicated and/or synchronized and verified many times a day via the hardware appliances utilized in our solution. Additionally, the local tape silos will accommodate complete system backups of each of the systems in each of the respective data centers.

Since all of the required storage for this solution will be included in the compute appliance, there will be no external connectivity to SAN frames (although available) or other devices, allowing extremely fast and efficient local disk access. Furthermore, the intelligence build in to the IBM PURE APP systems allows each of the server compute instances to be self aware and repositories of the various Production Web, App, DB, etc. systems will synchronize to the appliance in the DR center, providing the ability to gain sub 60 minute disaster recovery in the alternate data center site.

The entire network routing between data centers is accomplished via IP layer-three network communication, which by default requires DNS routing. During the build of the EES system all servers, interfaces, and system routable components will be coded with DNS names, and not specific IP addresses, that can easily be understood via the multiple DNS servers that reside in our network. This will obviously be verified during systems implementation, and verified during the first annual disaster recovery drill, post 'go-live'. As part of the DR test and the developed enterprise support run book, adjustments will be constantly made to the processes and policies to ensure full adherence and specific outcomes in the support and management of the EES solution.

Metadata Management

A semantic layer is created using Framework Manager as a part of *SmartPro MedEE* development project. The availability of a semantic layer allows end users to create queries and reports without having to have a highly detailed understanding at the data model data element level. The same semantic model can be published in the BI portal for the power users and can also be leveraged to create ad hoc reports.

Clustering, Load Balancing and Database Recovery

When running in normal, Non-Disaster Recovery mode, the Production Environment running in the Primary Center ships its database log files to the Production DRR Shadow environment running in the Secondary Center. The Shadow Environment applies these log updates in near real-time to its copy of the production database, which provides a nearly synchronized database resident in the Secondary Center at all times. If it becomes necessary to invoke Disaster Recovery due to a loss of the Primary Center, the Shadow Environment is shut down, and the dormant Disaster Recovery environment is instantiated, pointing at the shadow database. The Production Environment uses clustering and load balancing, while the non-production environments do not.

xii. Describe the design approach for the EES shall address three major sets of shared data:

- a) Real-time Integrated/Centralized Database – Data regarding an applicant's status, participant's profile, benefits records/account, and financial records must be stored in a centralized operational database for real-time access and subsequent follow-up and reporting;
- b) Data Warehouse and Data Marts – Data extracted from the Real-Time operational databases and other external sources must be integrated, aggregated and optimized into physical data warehouses and marts a timely fashion to support reporting and business intelligence needs; and

c) Document Repository – The EES must have the capability to connect to the State of Nebraska’s Enterprise Content Management System to centrally manage all documents throughout their lifecycle and share documents between various stakeholders.

The IBM Cúram application supports real-time database transaction processing with regard to applicant status, profile, benefits, and financial records. These records are stored in a centralized operational database.

The data warehouse and data marts are updated in off-line model. The operational data is extracted from the operational data store and then loaded into the data warehouse to provide for reporting and business intelligence needs.

The Wipro/IBM team will integrate the *SmartPro MedEE* with the state’s Hyland enterprise Content Management System using CMIS compliant interface standards. This integration will allow all documents to be centrally managed throughout their lifecycle. This approach will also facilitate the sharing of documents between various stakeholders.

xiii. Describe the approach to designing and deploying the appropriate Service Oriented Governance infrastructure technologies supporting the EES. The EES and approach, at a minimum, must take the following technology sub-categories into consideration while providing the details:

- a) SOA Policy Management;
- b) Service Portfolio Management;
- c) Compliance Engine;
- d) Service Repository;
- e) Service Registry;
- f) SOA Monitoring; and
- g) SOA Policy Enforcement.

IBM WSSR – SOA Policy and Service Portfolio Management and Compliance is enabled by the WebSphere Service Registry and Repository (WSRR), which provides clear visibility into distributed service associations and while enabling governance across platforms of the entire services lifecycle through true end-to-end repository federation to provide multi-data center implementation of the environment.

The Wipro/IBM team establishes best practice SOA and service compliance including Service Lifecycle definitions, procedures for steps in the service lifecycle, management (Service Level Agreement/Objective) metadata, service definition documents, and service dependency metadata.

xiv. Describe the Case Management and Business Process Management technologies and design approach supporting the EES. The approach, at a minimum, must take the following topics into consideration while providing the details:

- a) Rules Engine;
- b) Registry;
- c) Process modeling support;
- d) Workflow and task management; and
- e) Administration.

The Case Management solution leverages the same framework upon which the core eligibility engine is built. The power of this rules and workflow framework is demonstrated in the answer to this question. There are no additional architecture tools to purchase in order implement a new business process. The rules and workflow tools remain the same as those used for core EES rules and workflow configuration. See previous answers in this section regarding rules and workflow engine processing for the *SmartPro MedEE*.

xv. Describe the EES Monitoring and Logging capabilities. The approach, at a minimum, must take the following topics into consideration while providing the details:

- a) Fault Monitoring;
- b) Performance Monitoring;
- c) Configuration Monitoring;
- d) Network Monitoring;
- e) Security Monitoring;
- f) Management and Reporting; and
- g) Root Cause Analysis.

DCS operates world-class global data centers and offer extensive expertise with every computing platform, including iSeries, Windows, UNIX and Linux servers, Mainframe, Cloud (iStructure), as well as networking, security and storage systems.

Wipro Data Center Services manages its customers' systems in world-class, purpose built data centers that are fully redundant, fault tolerant, highly secure, and include hardware, software, and data communications equipment. Our geographically dispersed data centers total more than 430,000 square feet. Our data centers listed below undergo SSAE16 audits, and are PCI certified. (Wipro Data Center Services manages six data centers within the continental United States and one in Meerbusch, Germany).

Secure Access Monitoring

Wipro manages the existing VPN appliances for IPSec VPN and SSL VPN clients. Wipro's Security Analysts will manage and monitor the VPN clients and access control. The critical activities include ongoing activity of management and monitoring of remote access by users, remote access servers/devices to provide ease of access for remote and distant users, address Remote Access authentication / authorization problems, Receive and solve Remote Access client application-related and Remote Access device related Service Requests, etc.

Firewalls and DMZ for External Access and Remote Access Monitoring

Without going into specific model and network configurations, Wipro has deployed and manages state of the art security and network segmentation for all types of enterprise environments/applications.

As part of the Security architecture design, Wipro creates 4 separate Data Security Zones. Each zone will be discrete and contain only applications with similar security restrictions.

Internet Access: This segment segregates the internet connection from rest of the State of Nebraska network.

External DMZ: This segment hosts the external facing servers such as Web servers, SMTP Gateways, VPNs, and other publicly available web servers.

Internal DMZ: This segment hosts the internal servers of the State of Nebraska including Anti-Virus, etc.

Internal Network: This network segment provides network connectivity to the State of Nebraska users to access corporate applications. It includes users in remote offices, local server segments as well as corporate users.

Logging of Activity/Alerts

Standard core router/Layer3 switch logs are generated via standard rules/policies. Issues deemed to fall outside of the rules/policy will send alerts to the monitoring servers and tools. Subsequent tickets and notifications will be sent to the support teams for research and resolution.

Intrusion Detection

Use of IDS sensors ensures that the security setup is not susceptible to a sustained attack by an outside presence or coordinated effort.

Separate VLANs: These would be created for segregating within the IT Infrastructure team from the servers that are deployed on-site. Appropriate access restrictions would be applied to ensure that only authorized Wipro/State users are allowed accessed. No 'citizen' connections will be connected via VPN, but rather will come across the Internet connections to the Cúram application.

Public Key/PrivateKey Encryption Secure Socket Layer (SSL) Certificates

Industry standard 256-bit encryption will be installed on all external facing VPN/non-internal interfaces and 128-bit certifications will be used on internal site and data structures. All connections will be secured via Cisco's "Secure VPN" application.

Monitoring Tools and Maintenance Routines

The Wipro data center uses the full complement of CA Unicenter management and monitoring tools. Wipro's strategic partnership with CA allows full utilization and supports the full suite of components. For network specific monitoring:

CA Nimsoft Monitor is built on a unified architecture that enables Wipro to monitor servers, networks, applications, databases, storage, private and public clouds as well as end user response time. This unified architecture allows for extremely efficient monitoring capabilities and is deployed across the Wipro data center environment.

Generate Administrative Alerts

Wipro uses the full complement of CA Unicenter management and monitoring tools. Wipro's strategic partnership with CA allows full utilization and supports the full suite of components. Since Wipro also utilizes the CA Service Desk module across our enterprise, threshold monitoring, alerts and automated ticketing is seamless and fully integrated.

CA Nimsoft Monitor is built on a unified architecture that enables Wipro to monitor servers, networks, applications, databases, storage, private and public clouds as well as end user response time. This unified architecture allows for extremely efficient monitoring capabilities and is deployed across the Wipro data center environment.

SLR Monitoring

As referenced above, the CA Unicenter suite will supply the monitoring of all systems, based upon the unique configurations, required by the State or any other groups of the EES support organization requires.

Application Performance Monitoring

SmartPro MedEE uses IBM's PureSystems Manager (PSM), coupled with ITCAM for Applications, to monitor attributes ranging from low level technical information such as CPU utilization, through subsystem and application health, and up to application response time metrics. Using SNMP, these tools forward salient information upstream to the Enterprise Data Center monitoring tool.

Root Cause Analysis

Wipro focuses on continuous service improvement (CSI) to correctly track the appropriate key performance indicators along with resolving issues effectively. Our internal service delivery process ensuring operations activities are optimized is

Wipro's Continuous Service Improvement Vision

Detailed post incident reports (PIR) are published for severity 1 problems to document root cause and correction actions taken to resolve the problems. The information gathered during a particular corrective process is used to assist the staff in resolution of future similar issues.

Wipro/IBM informs MLTC via primary, secondary, and/or tertiary contacts previously established by the State of Nebraska in the contact system. Specific callout procedures are established per MLTC requirements. Contacts are made when severity 1 or 2 network faults or performance issues arise.

xvi. Describe the approach to leveraging the State of Nebraska's Enterprise Content Management System technologies for Eligibility Determination process. The approach, at a minimum, must take the following topics into consideration while providing the details:

- a) Store Electronic Forms;
- b) Scan, Index and Store Imaged Documents;
- c) Searching of Documents; and
- d) Digital Rights Management Capabilities.

Wipro proposes to level the existing State infrastructure to store electronic forms, scan, index and store imaged documents, as well as search documents. Integration with the State's Hyland document repository will be accomplished using Content Management Interoperability Services (CMIS) protocol. For response time purposes, those documents and forms that are lined to an eligibility record may be stored in the *SmartPro MedEE* database. This design consideration will be determined

in conjunction with the Department. The Wipro/IBM team will discuss DRM requirements during the requirements analysis phase.

xvii. Describe the approach to Identity Management supporting the EES;

The Wipro/IBM team proposes to integrate with the State's Active Directory solution to support Identity Management. Single-Sign-on support will be facilitated using Redhat's JBOSS Single Sign-on software product.

xviii. Describe the Shared Analytics approach supporting the EES. The approach, at a minimum, must take the following topics into consideration while providing the details:

- a) Shared Analytics Architecture and Design;
- b) Integration and Data Quality;
- c) Metadata and Data Quality;
- d) Availability and Security;
- e) Performance;
- f) Connectivity;
- g) Scalability;
- h) Compliance;
- i) Deployment;
- j) Application Support; and
- k) Administration and Backup-Archiving.

Our *SmartPro MedEE* "Cúram-in-a-virtual-box" solution promotes and facilitates shared analytics services. The IBM PureApp appliance is scalable, with additional storage and memory capacity, if needed. To provide connectivity, the Wipro/IBM team is requisitioning a dedicated circuit from the State data center to the Wipro data center in Omaha Nebraska.

xix. Describe the language environment(s), standards, relational databases, channels supported, hardware platforms supported, and other aspects of the technical direction for the EES; and

The *SmartPro MedEE* solution is a J2EE java-based solution, using the IBM DB2 relational database. The core IBM Cúram Eligibility engine is proposed to operate on a PureApp appliance running AIX. The software can also operate on Linux, if desired. Peripheral applications to the core of our solution, like WebSphere Application Server, IBM Integration Bus, LifeRay and other tools are going to be run in an AIX or Linux (LifeRay) environment.

The core IBM Cúram Eligibility engine, based on the flexible rules and workflow engines, is able to constantly evolve to meet new business needs. The IBM team is continuously adding new data models that support additional business domains – all using the same rules and workflow technical architecture.

xx. Describe the timetable for migration of the EES to new technologies, product sets, or standards.

With regard to standards, Wipro and IBM understand the importance of federal compliance and incorporates analysis of emerging standards with every release. As a result, our customers get the valued add of having an enterprise toolkit in Cúram and a domain specific product roadmap.

Cúram modules are built on top of a single data model. This single data model approach allows for integrated case management across social service programs, within the same application. While there is a single data model, it allows for incremental modernization while maintaining the integrity and independence of a single department like Nebraska's Medicaid and Long Term Care department. The architecture and decision to have a single data model within Cúram was a critical design feature. Without it, each one of the solution area such as eligibility, Medicaid, child welfare, cash assistance and food stamps would require a separate data model requiring heavily configured data architecture assets to support cross-application activity. To establish an integrated case would require several data integration tools to simply surface data at the presentation layer. Building out a reliable case takes time and understanding of the rules and workflows, which are not associated with the data model. The lack of integration would cause problems in ensuring data is normalized across modules for a public services organization.

In addition, Cúram continues to invest in data model extensions to augment our domain expertise. The Cúram product roadmap shows a focus on adding data models to expand the value of Cúram in the enterprise.

f. *Software and Hardware Components*

Describe the supported OS platforms and Server Configurations for the EES. Include minimum recommended specifications to support the proposed solution in all required environments (e.g., sandbox, configuration/development, testing, quality assurance, production, training, and disaster recovery);

Describe the client (desktop) architecture for the EES, including minimum recommended specifications (e.g., RAM, video RAM, disk space, processor speed) to support the EES, as well virtualized configurations to improve manageability and reduce operational costs;

Describe the proposed data storage software and hardware components;

Describe the tools and utilities used to design, build, test, deploy, report, monitor, and operate the EES and its components;

Describe the architecture of other devices such as printers, electronic signature pads, smart card reader/writer and attached disks, which are necessary or recommended for the EES, including minimum and recommended specifications to support the proposed solution; and

Describe the proposed solution approach to network topology and hardware required to achieve this architecture (e.g., load balancing utilizing hardware and software based load balancers ahead of the web servers, Virtual Private Networks (VPNs), creation of DMZs by firewalls).

SmartPro MedEE is implemented on two dedicated IBM PureApplication Server Appliances, identical in configuration. One server is housed in the Wipro Primary Data Center in Omaha, Nebraska; the other in a Secondary Data Center in Tempe, Arizona. Both boxes participate in a balanced mix of Production and Non-Production workloads, so there is no single piece of hardware that can be identified as "Production" versus "Non-Production/Development" versus "Disaster Recovery".

Either box alone is large enough to run a full capacity Production Environment, plus all other Environments with reduced capacity, at the same time. Both sites are provisioned to backup each other. When both sites are operational, each has spare physical capacity to allocate to growth and to

unexpected peaks. All “Environments” e.g. Production, System Test, Sandbox, Training, are fully virtualized.

Note that both servers must remain identical in configuration.

PureApplication Server is a totally integrated appliance, encompassing compute, memory, storage, and much of the fully integrated middleware, and monitoring (DB2, WebSphere, ITCAM) in a single chassis. The amount of internal “disk” storage quoted below is fixed, and inside the server’s single cabinet – we do not rely upon any SAN storage. It is not expected that *SmartPro MedEE* will require additional storage beyond this configuration. If necessary, additional storage can be deployed using standard Data Center SAN technology.

PureApp Servers are fully redundant, without single points of failure. PureApp servers can be expanded while live, without loss of service. For example, new Compute Nodes of 32 CPU cores / 512GB RAM can be added without bringing down the server, and their resources made available and useful while the server is still hot.

For IBM server software that is priced based on computing capacity (PVU’s), each server core allocated to this software is rated at 100 PVUs. Fractional allocations can be made i.e. one-half of a physical CPU Core would rate at 50 PVUs.

Table IV-14 lists the configuration of for one server: deployment of *SmartPro MedEE* requires two identical boxes for this configuration.

Table IV-14: Server and Operating System Configuration

Server	Details
IBM PureApplication Server 1700-64E	Operating System: AIX 7.1 64 Power7+ Processor Cores, in 2 Nodes of 32 Cores each 1 TB (Terabyte) of RAM – 1066 MHz, DDR3 16 x 400 GB Solid State Drives (6.4 TB total SSD) 80 x 600 GB 10k Disk Drives (48 TB total HDD) (All SSD/HDD can be configured into RAID arrays as required: total 48 TB usable) 42U Large Rack (expandable to 608 Cores / 9.5 TB RAM) Fully redundant power, fans, bus, network interfaces, management nodes

- ii. Describe the client (desktop) architecture for the EES, including minimum recommended specifications (e.g., RAM, video RAM, disk space, processor speed) to support the EES, as well virtualized configurations to improve manageability and reduce operational costs;

SmartPro MedEE’s components, both for internal and external users, are designed for browser based deployment: as such they have little dependency upon underlying hardware platforms. For internal user desktops, any supported Microsoft Operating System, executing on a 1Ghz+ processor with 512MB available application memory and configured with a compliant browser is minimally adequate.

While heavily virtualized on the server-side, *SmartPro MedEE* does not require nor depend upon virtualization of client desktops.

iii. Describe the proposed data storage software and hardware components;

The proposed hardware configurations, including data storage, are listed in Table IV-14 above.

Table IV-15 lists the software that comes as part of each PureApp appliance. This software is an integrated component of the appliance, and cannot be separated from the server. These components are licensed for unlimited use within the server and have no capacity limitations.

Table IV-15: PureApplication Server Software

Component	Description / Role / Purpose
IBM AIX V7.1	Operating System
IBM DB2 Enterprise Server Edition 10.1	Relational Database, supporting all application components.
IBM WebSphere Application Server Hypervisor Edition V8.5.5 for AIX	Java/J2EE Application Server; Web Server. Includes PureApp Deployment Patterns.
IBM PureSystems Manager V1.1	Integrated PureApp Server Appliance Management Tool

Table IV-16 lists software components required to operate *SmartPro MedEE*, including application SW and Middleware.

Table IV-16: Application Software and Middleware

Component	Description / Role / Purpose
IBM-Cúram	COTS Application. Core Application – Eligibility, Enrollment, Case Management.
LifeRay Portal Enterprise Edition V6.2	COTS Application. Overall Portal / Entry point to all application components; general Web Information Portal; single Sign-On coordination with State’s AD and Cúram Directory; Wiki; Blog; Chat; Social Media; Customized Content; Web Content Management; Published Document Management (Manuals, Guides,... - not imaging and application “docs”).
Orbeon Forms Gold V4	COTS Application. Advanced forms creation within LifeRay.
Survey Monkey Platinum Edition	SAAS offering. Web based surveys; HIPAA compliant. Unlimited surveys.
Pitney Bowes Spectrum Universal Addressing	COTS Application, with address data updates. Real-time address validation and correction; Zip Code to City conversion; partial address matching.
IBM Cognos BI V10.2.1	COTS Application / Tool Business Intelligence; Production Reporting; Ad-Hoc Reporting; Dashboards; Drill-Down. Includes Server, Users, Architect (Design Tool), PureApp deployment Pattern.

Component	Description / Role / Purpose
IBM Integration Bus Hypervisor Edition for AIX, V9.0	COTS Middleware. Provides ESB functionality (Message Broker), and FTP/SFTP file transfer services. Includes PureApp Deployment Pattern.
IBM WebSphere SOA Policy Gateway for AIX, V2.5	COTS Middleware. SOA Registry (aka WSRR) and Governance Policy Management. Includes PureApp Deployment Pattern.
IBM InfoSphere Optim Data Privacy V9.1	COTS Tool. Creating sanitized data for non-production use. Software and PureApp Deployment Pattern.
IBM InfoSphere Information Server Enterprise Hypervisor Edition for AIX, V9.1	COTS Tool. ETL and Data Quality Management. Aka DataStage and QualityStage.
IBM InfoSphere Standard Edition; Master Hub and Patient Hub; V11	COTS Tool. Master Data Management; deduplication; cleansing.
IBM Sterling Connect Direct Premium Edition	COTS Tool. Connect-Direct File Transfer Protocol, used by many interfaces.
IBM Sterling File Gateway Enterprise Edition	COTS Tool. File Transfer coordination and control.
IBM Sterling Secure Proxy	COTS Middleware. Secure Proxy across DMZ for File Transfers.
IBM SmartCloud Workload Automation V9.1	COTS Tool. Job scheduling and control.
IBM Tivoli Composite Application Manager for Applications (ITCAM)	COTS Management Tool. Monitoring Application performance and availability.
Bonita BPM V6	Open Source Tool / Middleware. BPM Graphical Design (BPMN 2) BPM Execution Engine

- iv. Describe the tools and utilities used to design, build, test, deploy, report, monitor, and operate the EES and its components;

Table IV-17 lists the software tools used to design, build, test, and deploy *SmartPro MedEE* while Table IV-18 below lists the Data Center operational tools used to monitor and manage the overall hosting environment, including *SmartPro MedEE* and its servers, storage, and network fabric.

Table IV-17: *SmartPro MedEE* Tools (PMO/SDLC)

Component	Description / Role / Purpose
MS Project 2013 Professional	Project Management
Adobe Captivate 7	Creation of Computer Based Training (CBT) Content
Adobe Acrobat Standard V11	CBT and general document production
Snagit 11.4	Screen Capture for CBT and Documentation

Component	Description / Role / Purpose
ER/Studio Data Architect XE4	Advanced Data Modeling, BI Data Modeling; Physical Data Model Design
IBM AppScan Standard V8.8	Vulnerability Testing / Penetration Testing
IBM Rational Team Concert	Application Lifecycle Management (ALM) and coordination; team coordination; Change/Configuration Management; Source Control
IBM Rational Requirements Composer	Requirements Management and Traceability, integrated with Quality Management
IBM Rational Quality Management	Quality Program Management; Test coordination; QA Integration with Requirements.
IBM Rational Software Architect	Cúram System Design and logical data modeling.
IBM Rational Policy Tester / Access	508 Compliance Testing (accessibility / handicapped)
IBM Rational Performance Tester / Workbench	Coordinates Develop and Coordinate Tests. SOA Testing.
IBM Rational Performance Tester / Virtual Users	Performance, Stress, and Load Testing; User simulation.
IBM Rational Virtualization Server	Integration Test Support; Stubbing out missing components and interfaces during Integration Testing.
IBM Rational Functional Tester	System / Regression Test Automation.
Jenkins 1.547	Open Source tool for build automation and management.

Table IV-18: Data Center Shared Services Management Tools

Component	Description / Role / Purpose
Juniper VPN	VPN Services and Management
Computer Associates Spectrum 8.0	System and infrastructure Monitoring <ul style="list-style-type: none"> Periodic polling of system resources (processors, memory, storage, switches, hubs, and routers) for availability Establishing availability thresholds for various components by using industry standards, Wipro/IBM experience, and State input Measuring actual availability against thresholds Taking appropriate actions, as predefined by Wipro/IBM and the State, when one or more system resource thresholds are exceeded Reporting monthly on availability For PureApplication Servers, accepts alerts using SNMP
Emprisa	Manages network device configurations
McAfee Intrushield	Network Intrusion Detection and Circumvention
Sophos Server AntiVirus	AntiVirus / Malware Detection for Servers
Tripwire Enterprise V8	File change alert generation / File Integrity Monitoring
Tenable Nessus V5	Vulnerability scanning and reporting for network connected endpoints

Component	Description / Role / Purpose
NetIQ AppManager 6.0.2	<ul style="list-style-type: none"> Coordinates with SmartCloud Workload Automation to monitor and report on Batch Jobs Coordinates with PureSystems Manager to capture end-to-end system and application availability Coordinates with PureSystems Manager to capture threshold alerts for system resource utilization, performance, and event log details Storage and Data Management Monitoring
Servergraph Storage Console	Monitor and Report on Backup jobs (Tape Storage)
Computer Associates eHealth	<ul style="list-style-type: none"> Provides near real-time and historical reports showing LAN and WAN usage, availability, errors, usage trends and other customizable variables. Reports are created and made available via the customer web portal with this service.
Computer Associates Service Desk Module	<ul style="list-style-type: none"> Creation and Management of Service Tickets Service Ticket Escalation Management Customer Self-Service Portal

- v. Describe the architecture of other devices such as printers, electronic signature pads, smart card reader/writer and attached disks, which are necessary or recommended for the EES, including minimum and recommended specifications to support the proposed solution; and

SmartPro MedEE does not require these types of devices.

- vi. Describe the proposed solution approach to network topology and hardware required to achieve this architecture (e.g., load balancing utilizing hardware and software based load balancers ahead of the web servers, Virtual Private Networks (VPNs), creation of DMZs by firewalls).

SmartPro MedEE is implemented on two dedicated IBM PureApplication Server Appliances, identical in configuration. One server is housed in our Primary Data Center in Omaha, Nebraska; the other in the Secondary Data Center in Tempe, Arizona. Both boxes participate in a balanced mix of Production and Non-Production workloads, so there is no single piece of hardware that can be identified as “Production” versus “Non-Production/Development” versus “Disaster Recovery”. The server configuration are as described above.

Figure IV-70 depicts the recommended high-level network connectivity. Wipro/IBM will deploy a trunk line directly from our Primary Data Center in Omaha to the State’s Data center. This line serves as the normal route for all internal traffic between the State and *SmartPro MedEE*, both computer to computer and internal users. Under normal operation, traffic destined for our Secondary Center in Tempe is routed internally over Wipro’s secure networks.

Wipro DCS Network Solution for Nebraska EES

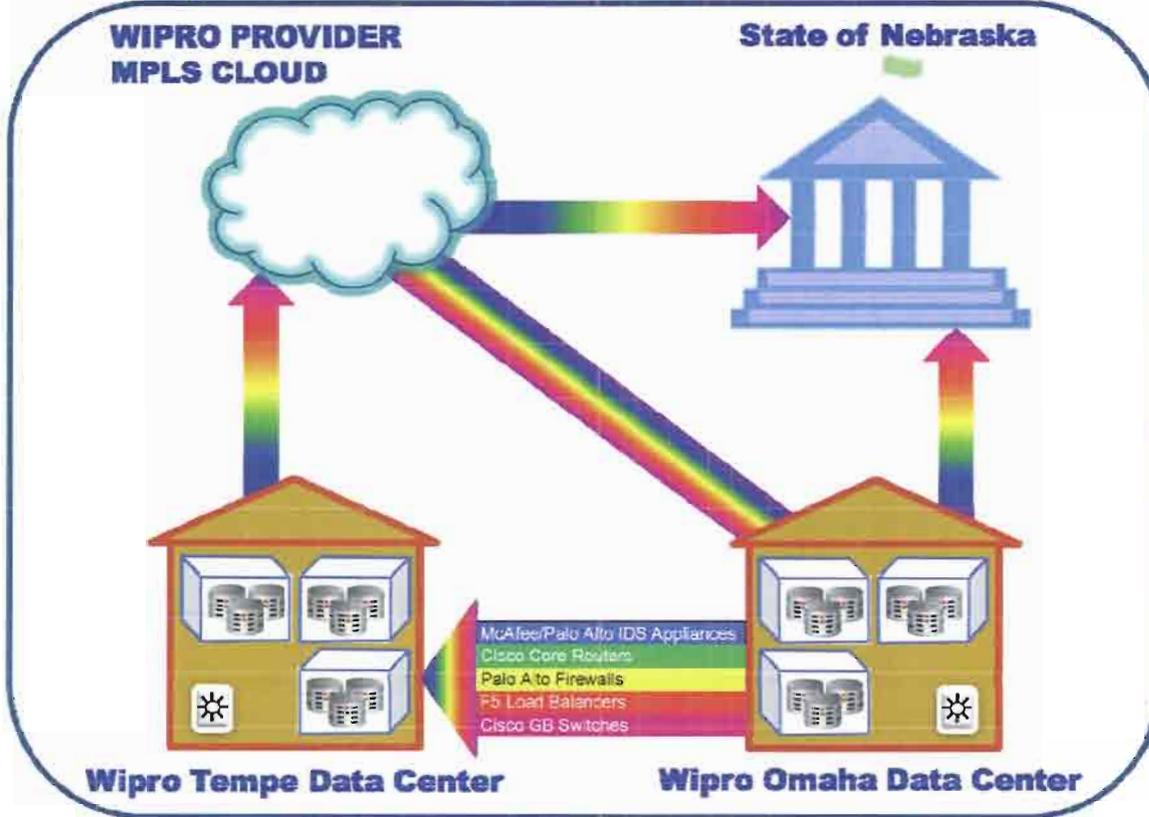

Figure IV-70: Network Connectivity

Inside each Data Center, we are deploying one PureApplication Server, as shown in Figure IV-71. Of special note, the Production Environment running in our Primary Data Center ships all database logs over to the Secondary Center in near real-time. The log files are applied immediately in the Secondary Center to maintain a shadow copy of the production database, current within moments, for Disaster Recovery.

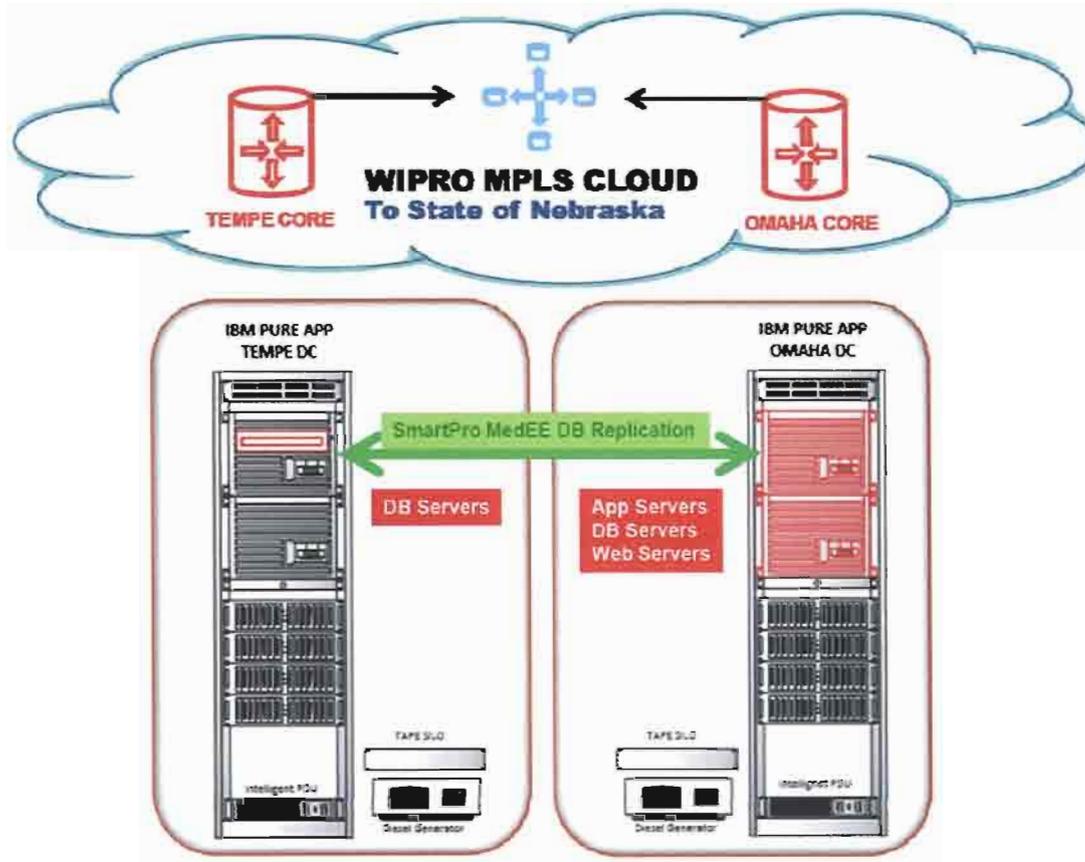

Figure IV-71: PureApplication Server Deployment

Within each Data Center, *SmartPro MedEE's* PureApplication Servers are integrated into our shared services network fabric. The network topology is divided into four discrete security zones:

1. **Internet Access:** This segment segregates the internet connection from the rest of *SmartPro MedEE's* network
2. **External DMZ:** Hosts external facing servers such as Web Servers, SMTP Gateways, VPNs, and other publicly available web servers
3. **Internal DMZ:** Hosts *SmartPro MedEE's* internal servers, such as Application Servers, Database Servers, Anti-Virus, etc.
4. **Internal Network:** Provides network connectivity to the State of Nebraska internal users

While the PureApplication Server is a single integrated appliance, it supports multiple redundant network interfaces, with virtualized network addresses assignable to individual virtual machines. Each virtual machine can appear to the network as a distinct entity that can be placed into its own correct network segment. This is used to segregate Production VMs from Non-Production VMs by maintain distinct Private Virtual Local Area Networks – PVLANS. PVLAN segmentation is enforced by the CISCO routers, isolating all traffic for entire environments as required by the security model.

Firewalls establish protected zones, as depicted in Figure IV-72: Network topology.

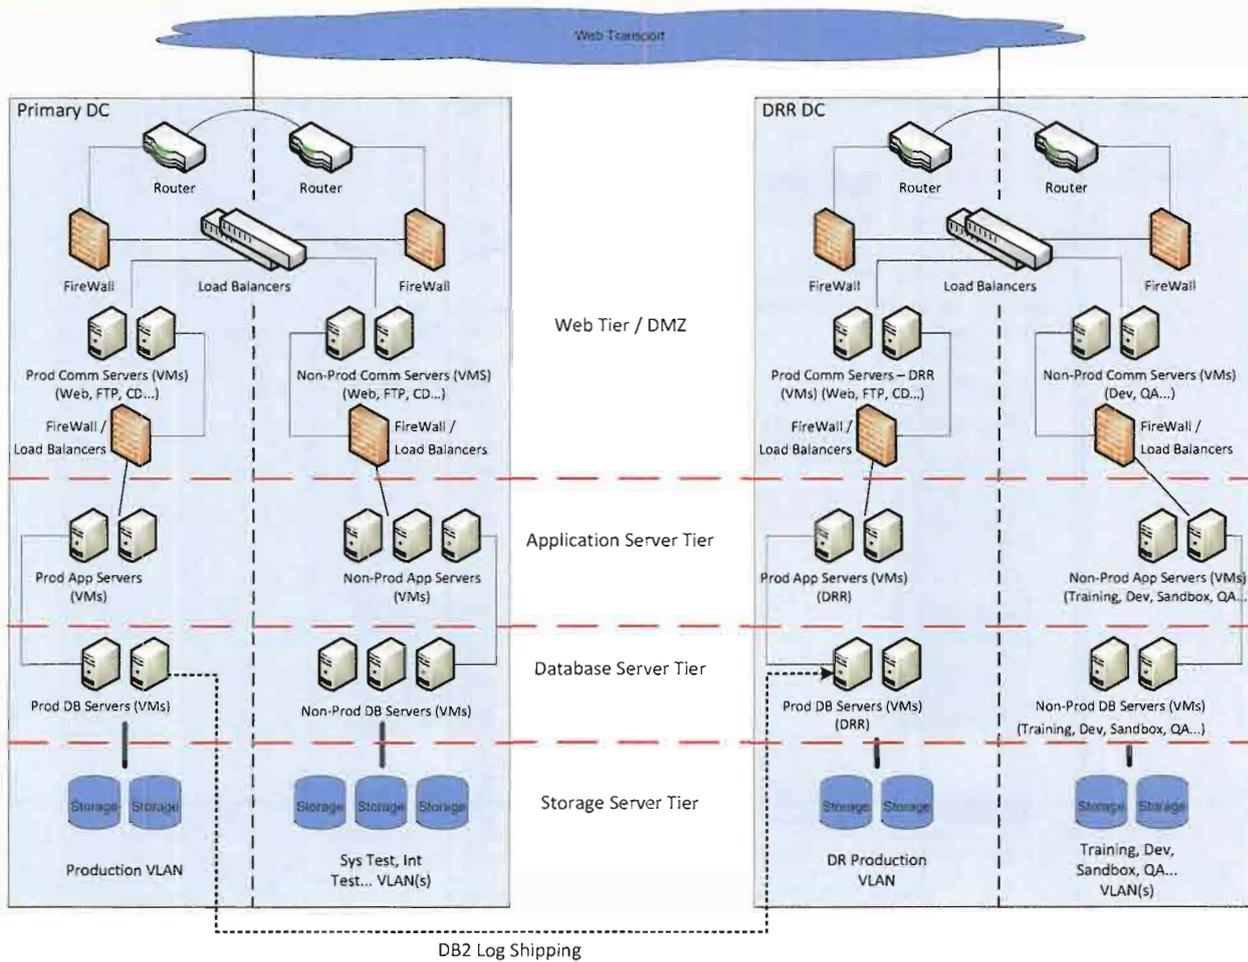

Figure IV-72: Network Topology

g. *Environmental Installation and Configuration*

The Bidder must propose, provide and operate all required environments to support its proposal for the specification, design, development and implementation of the system including, but not limited to the following environments:

- a) Sandbox;
- b) Configuration/Development;
- c) Test;
- d) Quality Assurance;
- e) Production
- f) Training; and
- g) Disaster Recovery

These environments should be sized in accordance with planned use and be inclusive of all hardware, storage, networking, backup/restore, database, file system, monitors and other items as required to comprehensively support the development effort.

Background

The Wipro/IBM team has mapped the State's Development Environments into the set of Environments described in Table IV-19 below. We are proposing implementation of all **SmartPro MedEE** Environments, Development, Production, and DRR, on two identical IBM PureApplication 1700-64E Servers. These servers include all computing resources and storage required to operate **SmartPro MedEE**; only the Network Fabric, Data Center Enterprise Monitoring and Management tools, and Tape Backup are outside of these two boxes. The two servers are dedicated to the State's EES; the Network Fabric, Data Center Management, and Tape Backup are shared services within the Data Center.

Each server consists of 2 compute nodes with an aggregate of 64 Power7+ processor cores, a total of 1 TB of RAM, and approximate 50 TB of integrated disk storage, combining a mix of Solid State and classical Magnetic Disk storage. These servers are highly resilient, with no single point of failure, redundant power, network interfaces, busses, and RAID storage.

The two servers are designated Primary and Secondary, reflecting their respective roles relative to the main Production Environment. The Primary Server sits in Wipro's Primary Data Center located in Omaha Nebraska, and services the normally operating Production Environment, and several of the Non-Production Environments at the same time. The Environments are isolated from each other using Virtual Machine (VM) technology, where an Environment consists of one or more dedicated VM configurations and related data stores, configured to meet performance, security, and availability goals unique to each Environment.

The Secondary Server is located in Wipro's Secondary Data Center in Tempe Arizona. In normal operation, the Secondary Server receives near real-time database updates to a specialized small Recovery (Production) Environment, which keeps a shadow copy of the production database in near currency with the real production database housed back the at the Primary Site. This consumes a small amount of the overall Secondary Server resources. The rest of the Secondary Server resources are dedicated to most of the Development Environments. While maintaining full performance capacity for the Production Workload without compromise, each server is capable of running all Environments simultaneously if needed, though with reduced capacity allocated to the non-Production Environments. The one exception is that both Production and QA (Large), the full sized load, stress, and performance test environment that mirrors Production, cannot co-exist on the same single server with introducing at least a possibility of performance interference between the two.

This balanced Workload makes all hardware useful at all times, with nothing specifically dedicated to Disaster Recovery. The use of VM technology allows the physical resources to be moved around as required to meet performance targets – an operation that is mostly automated, dynamic, and real-time in the PureApplication Server Environment.

Development Environments

We have mapped the State's requirements to the following set of Development Environments. Table IV-19 documents the list of Environments, and describes their general purpose.

Table IV-19: Development Environments

Environment	Description / Purpose	Default Server
Development	Supports multiple instances of configuration and development. Near full functionality is available, though often not used. Limited performance capacity, limited and sanitized data. Provides controlled updates into System Test.	Secondary
System Test	System Test brings together one or more application components for formalized testing by QA. Near full functionality is available, though often not used. Limited performance capacity, limited and sanitized data. Receives controlled updates from Development, provides controlled updates to Integration Test.	Primary
Integration Test	Integration Test brings together most/all application components, including "outside" interfaces for formalized testing by QA. Full functionality is available, and often used. Limited performance capacity, limited and sanitized data. Receives controlled updates from System Test, provides controlled updates to QA (Small and Large.)	Primary
QA (Small)	Aka User Acceptance (UAT). QA (Small) is used for most final acceptance testing, when full load / stress testing is not indicated. Full functionality, limited performance capacity, database can be full or limited as required. Receives controlled updates from Integration Test, provides controlled updates to Staging and Production. Only one of QA (Small) and QA (Large) are running at one time.	Secondary
QA (Large)	Aka User Acceptance (UAT – Load/Stress). QA (Large) is used for final acceptance testing, when full load / stress testing is indicated. Full functionality, full performance capacity, full database. Receives controlled updates from Integration Test, provides controlled updates to Staging and Production. Only one of QA (Large) and QA (Small) are running at one time.	Secondary
Sandbox	Sandbox is a specialized environment dedicated to State personnel for controlled experimentation and testing of limited changes to an existing or proposed environment – especially non-code-based changes such as rules, configuration, and Business Intelligence. Near full functionality (lacks outside interfaces), limited performance capacity, database limited or full as required. Can be rapidly refreshed to a known state. Normal refreshed state is Production functionality. Controlled updates mirror Production.	Secondary
Training	Training is a specialized environment dedicated to training staff, especially in the context of formalized instructor-led training. Near full functionality (lacks outside interfaces), limited performance capacity, limited and sanitized database. Functionality and data can be rapidly refreshed to a known state. Normal refreshed state is Production functionality, but can be imaged from QA (Small or Large) to train to a forthcoming release. Controlled updates mirror Production or QA (Small or Large.)	Secondary

Environment	Description / Purpose	Default Server
PMO	A specialized environment used to host tools used by the Program Management Office and the SDLC. For example, Requirements Management and Test Management. No connection with Production functionality, limited performance capacity, limited and specialized database.	Secondary
Staging	A small “code” environment used to stage updates into Production, after signoff and approval for implementation by the State. Staging receives its code from QA, either large or small depending upon the change, and drives the configuration into Production.	Primary

Each of these Development Environments is configured as a PureApplication Server Workload, comprising one or more Virtual Machines. The allocation of VMs is designed to reflect the performance, security, and high-availability requirements specific to each task. Generally, these environments are relatively small, with compressed tiering e.g. Web Server and Application Server placed in the same tier and VM, and do not use clustering or load balancing, either for performance or high availability. At the other extreme, the QA (Large) environment is a complete duplication of Production, with a replication of the complete tiering, clustering, and performance characteristics of Production.

Contingency / DRR for Development

Several assumptions are built into our design covering contingencies for the Development Environments:

- While RTO for Development Environments is not as aggressive as for Production, it should be possible to recover any / all Development Environments to their alternate sites, if needed. While reinstating Production is the first focus in Disaster Recovery, once instantiated, development activities may still be required or desired while in contingency mode.
- Loss of the Secondary Center, which hosts many of the Development Environments, is a much of a DRR scenario as loss of the Primary Center. It must be possible to restore most of the Development activities into the Primary Site.
- It is acceptable to compromise the performance of non-Production Environments when running under a Disaster Recovery scenario, but Production performance cannot be compromised.
- Non-Production recovery does not require the low RPO/RTO targets of Production – it is acceptable to synch to “yesterday’s” database.

To support these assumptions, we propose using PureApplication’s VM shipping capability to copy an Environment and its configuration from one server to the other. Once past Development, the other Environments are under Change/Configuration Management, which will automatically include synchronizing the Environment to its backup location.

As a fully virtualized implementation, including the compute, memory, network, and storage resources, physical resources are assigned commensurate with each Environment’s requirements. PureApplication Server allows resource assignments to be changed “on the fly”, and is configured to automatically tune an Environment within defined limits, based on resource utilization and performance targets. Beyond PureApplication Server’s configured self-tuning, staff can intervene to

make resource allocation changes nearly instantly in response to unforeseen contingencies, resulting in a highly flexible and cost-effective hosting environment.

h. Design, Development and Customization

For the State of Nebraska Eligibility and Enrollment Solution (EES), IBM's Smarter Care Platform Implementation Methodology (SCPIM) will be the overarching execution framework used to guide the project activities. The elements of SCPIM come from our extensive methodology library, IBM Unified Method Framework, which was built using the knowledge and experience of more than 138,000 professionals in 160 countries representing over a million person-years of experience. These already-proven methodology elements within the UMF Library are actively being refreshed to incorporate the latest best practices and are embedded within the SCPIM method.

SCPIM was formulated specifically with the understanding that today's business systems are no longer monolithic applications residing on a single platform, but rather a complex ecosystem of components working in concert to enable business functions. This aligns with the State of Nebraska for the EES solution. SCPIM differentiates itself from other methods in the industry by:

- Promoting interoperability between the system's components through holistic architecture design, end-to-end business requirements modeling, and full-lifecycle testing – an imperative for the EES solution.
- Allowing individual work streams to leverage their specialized techniques to increase productivity while still adhering to the overall project standards. This will benefit the MLTC KIP project by reducing required overall time and effort, without compromising on quality of deliverables.
- Aligning the non-technical project activities such as training and communication management with the technical activities to facilitate a seamless transition from the engineering stages of the project to the deployment and acceptance by clients.

IBM is experienced with combining several methodologies when developing solutions composed of multiple technologies. Client examples include the Alameda County Social Services MLTC ACES project and North Carolina NC FAST program.

i. Deployment

- Describe the methodology, tools, and techniques for implementation/rollout planning. Address specific staging, readiness and deployment techniques that the Contractor will use to determine the proper sequencing of deployment processes and functions required for successful implementation;
- Describe the implementation and deployment strategy. In addition, include a realistic implementation approach and timeframe for the implementation of the EES that meets the State of Nebraska's requirements. If some of the EES' Functional or Technical requirements and capabilities are not a part of the standard EES (available now or via configuration), describe a proposed phasing methodology to deliver to the State of Nebraska's full requirements for the EES and EES Platform. Provide reference to the proposed work plan and WBS in the required work plan submission; and

- iii. Describe how the Contractor will implement and comply with industry standard backup procedures and the State of Nebraska's backup requirements, as well as the State of Nebraska's record and document management policies. Describe the Contractor's backup processes and procedures.

SmartPro MedEE is the solution proposed by Wipro/IBM to replace the current N-FOCUS system.

The deployment plan will outlay the set of activities that are to be completed during the cut over phase to move from the existing old N-FOCUS system to the new EES system.

The deployment plan provides a comprehensive approach on the deployment strategies, activities, operational readiness, environment availability, cut over stage activities and also on the fall out plan which needs to be referred in case of a fallout.

Deployment Team: Roles and Responsibility

The key resources that are part of the deployment will be listed in the deployment plan. All necessary resources will be identified and agreed with the necessary stakeholders. The details of the resources including the individual name, role and contact details will be listed as part of the deployment plan.

Operational Readiness

Operational Readiness Review significantly enhances the Program success by ensuring the End-User environment is production ready. Wipro/IBM will work with the State of Nebraska to develop a readiness program in order to create the desired readiness state.

The possible prerequisites for the deployed will be identified upfront in the deployment plan. The deployment prerequisites will be discussed and agreed upon with all the concerned stakeholders. An operational readiness checklist depicting the details of tasks, responsible party and time lines to complete the required tasks will be detailed out. This checklist items current status will be reviewed on a weekly basis with all relevant stakeholders and corrective actions will be taken as discussed in the operational readiness meeting.

The operational readiness also focuses on people aspects like training to ensure the identified staff are trained in the new system. Communication is a key aspect to be taken care during any system implementation. Wipro/IBM will work closely with the change leaders to ensure a smooth implementation. The OCM (organization change management) will play a key role in the operational readiness by ensuring all transition activities identified are executed to ensure the team is ready for the implementation.

The deployment will be initiated only after all the prerequisites as indicated in the deployment prerequisites checklist are satisfied.

Cut-Over stage and Business Continuity Plan

The cutover stage is a key part of the implementation process. The cut over stage defines the process of transitioning from the old system to the new system. Wipro/IBM will define the cut over tasks that need to be performed before the actual go-live. Wipro/IBM will identify risks and mitigation plan for possible risks that are envisaged during the cut over stage. Weekends are the preferred choice of days for cut over activities since the transactional data load is the minimal over the week end.

The deployment will be carried out in a staged manner with checkpoints for each step. The step checkpoint will be set in a manner to have the ability to roll back to its earlier step in the event of a fall out.

Wipro/IBM will coordinate with all the required stakeholders and initiate the business continuity plan before the cutover activities are initiated to ensure there is minimal or no impact for the end users. The migrated data and business critical functionalities will be tested to ensure the new system is working as per the set expectations. Wipro/IBM will conduct a set of verification steps to ensure the new system is functional. The go-live announcement is communicated upon successful completion of testing the data and business critical features.

Back-out or Fallout Plan

A fall out plan will be part of the deployment plan. The fall out activities that needs to be undertaken will be defined as part of the fallout plan. The list of stakeholders who needs to be communicated about the fall out will be listed as part of the fall out plan along with the mode of communication.

The fall out plan will be invoked only if the issues that arise during deployment cannot be resolved and prior to go live announcement.

Wipro/IBM is committed to a complete install and will work through any issues encountered during the deployment. The decision to back out is an extreme situation and is made based upon technical issues in the new system which can make the system along with its associated sub systems unstable. The Wipro/IBM management team makes the decision on whether to recommend for a back out considering several factors like issues faced during deployment, issue severity, possibility to resolve within the deployment time frame etc.

A joint check point meeting will be initiated with the customer to arrive at the go –no go decision. In the event of a fall out, all the activities that were carried out in the deployment will be rolled back and the system will be made to point back to its earlier state before deployment to ensure business continuity. This will be based on the fall out tasks as described in the deployment plan.

Assumptions

The deployment plan is based on a set of possible assumptions which will be discussed with the customer and will be made part of the deployment plan. Below are some possible assumptions that will be (but not limited to) part of the deployment plan

The customer staff identified for support during deployment will be available during the deployment timeframe on an “as needed” basis in the event of any decision-making situation.

Wipro/IBM implementation team will be available and staffed in a combination of onsite and offsite during the implementation timeframe.

Wipro/IBM will designate a team of resources for support during deployment and post implementation.

iii Requirements Traceability Matrix

We have completed the three Appendices, relating to the Requirements Traceability Matrix: Appendix B – Functional Requirements Traceability Matrix; Appendix C – Non-Functional requirements Traceability Matrix, and Appendix D – Requirements Gap Analysis.

In the Functional requirements, *SmartPro MedEE* meets 68% of the requirements out of the box or with configuration; another 19% require modification, and less than 3% require new coding. For the Non-Functional Requirements, *SmartPro MedEE* meets 94% OOTB or with configuration, requiring modifications for 8%, and code development for another 8%.

In the Gap analysis, we have identified 5 gaps that require more than 1,000 hours of effort end-to-end. All five are accommodated in our project proposal and costing, all 5 will be designed and implemented fully tested by the go-live date of 3/19/2015, before entry into the Operations & Maintenance period.

Page Left Intentionally Blank

b. Non-Functional RTM – Appendix C

Please refer to Volume 3 of 3 for Appendix C

Page intentionally left blank

c. Requirements Gap Analysis – Appendix D

Please refer to Volume 3 of 3 for Appendix D

Page Left Intentionally Blank

iv. *Project Planning and Management*

1. *Project Management Plan*

- i. Describe in detail the Bidder's proposed Project Management Methodology and show how it provides an integrated approach to project management

The Wipro/IBM team proposes a governance model to establish a framework within which this program will operate to ensure MLTC's objectives are met. Through this governance model, our team will provide multiple forums for MLTC, Wipro, and IBM to jointly improve processes, share best practices, reduce risks, and quickly and effectively resolve issues. The objectives of the proposed governance model are:

- Facilitate collaboration between Wipro, IBM, and MLTC team members
- Provide flexibility to MLTC in prioritizing work items and resourcing
- Enhance speed of implementation
- Create an environment to co-innovate
- Optimize cost
- Improve quality and ensure continuous improvement

Our team's governance model is formulated towards fulfilling each of the above-mentioned objectives. Key constituents of the model are:

- **Governance Structure** with guiding principles and a partnership approach to facilitate collaboration
- **PMO** for setting up governance and sourcing processes
- **Program Review** to continuously monitor the program
- **Decision Rights** to demarcate roles and responsibilities of Wipro, IBM and MLTC team members
- **Issue and Escalation Management** to resolve disputes
- **Communication Management** to make sure all stakeholders are in synch
- **Change Management** to manage changes to scope and requirements and provide flexibility
- **Risk Management** to proactively identify and mitigate risks
- **Quality Management** to address timely resolution of defects
- **Contract Change Management** to make timely updates to the contract

Figure IV-73: Project Management Methodology Processes shows the scope of our Project Management methodology, which is supported by an extensive, online repository of intellectual capital such as process descriptions, technique papers, example work plans, and artifact templates. These make up the foundation upon which the Project Management Plan will be developed.

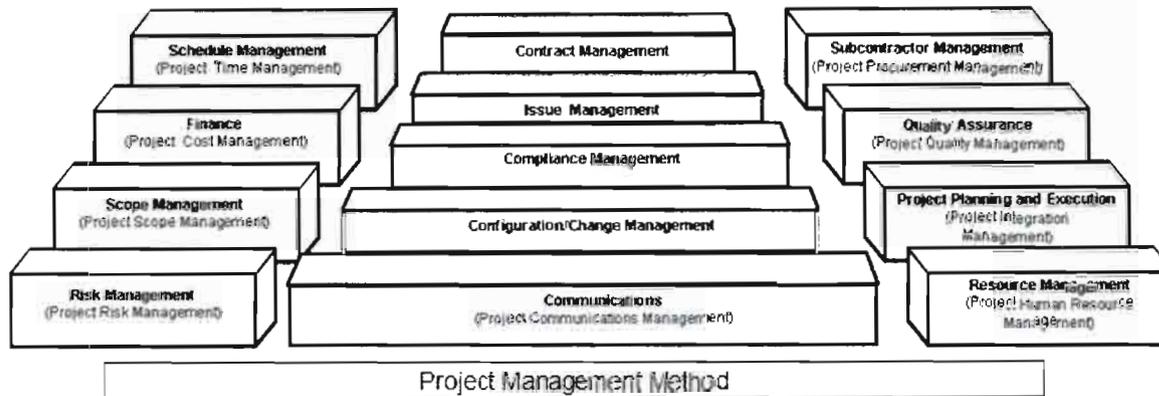

Figure IV-73: Project Management Methodology Processes

The Wipro/IBM team has adopted the U.S. DHHS Centers for Medicare & Medicaid Services Enterprise Life Cycle (ELC) and will utilize the Enterprise Life Cycle Templates which are referenced below:

(http://www.hhs.gov/ocio/epic/Enterprise%20Performance%20Lifecycle%20Artifacts/epic_artifacts.html)

ii. Describe how the proposed methodology is based on industry best practices

Our project management methodology includes concepts and practices from industry leading frameworks including:

- Project Management Institute (PMI) PM Body of Knowledge 4th Edition (PMBOK)
- Carnegie Mellon Software Engineering Institute (SEI)
- International Standards Organization (ISO)
- Earned Value Management System (EVMS)

The methodology provides guidance on project management practices for defining, planning, executing and controlling a wide variety of projects. It describes how to plan a project and how to manage its execution through three interrelated views:

- Project Management (PM) Domains
- PM Work Products
- PM Work Patterns

The PM domains provide the knowledge-based view and comprise a guide to 13 project management subject areas that comprises concept, planning, startup, execution, and closeout. PM work products are documents, including process descriptions, sample logs, and reusable templates and technique papers, which provide details on how to conduct the activities.

Figure IV-73: Project Management Methodology Processes depicts the components of our methodology that we will use to manage the *SmartPro MedEE* project. The thirteen PM domains are listed and, for the eight PM domains considered to be focus areas, we note the documents the project management team may implement when planning and managing the project. These documents have

been deployed and refined on numerous projects, providing reusable assets our team can tailor for MLTC, reducing project start up time and risk.

Like the PMI's PM Body of Knowledge (PMBOK) process groups, the PM work patterns provide steps in a thought process or a pattern of behavior that project managers may use in typical situations, such as preparing for delivery or handling an issue. There are work patterns for defining, planning, starting, monitoring, handling exceptions, handling deliveries, and closing. While they are designed to be usable on their own, the PM work patterns provide references to processes in the domains to enable easy access to more details. Each work pattern contains several elements. Our project manager can use the information within each element to help define the project's processes. Within each of the elements is information regarding the goal of the activity, interactions with other processes or activities, key work products and outputs. Figure IV-74: Work Patterns provides a top-level view of the monitoring work pattern, track, and control progress element.

Figure IV-74: Work Patterns

- iii. Include a detailed narrative of your proposed PMP. This PMP narrative must be in sufficient detail to demonstrate to the State of Nebraska that the Bidder has a clear and concise understanding of project's overall complexity and all associated tasks to successfully implement the requirements in this RFP.

The Project Management Plan will be created during the Project Initiation and Planning Stage, which includes the following activities:

- **Develop Project Management Sub-Plans.** This activity, as seen in the Table IV-20 below, is focused on defining the specific control processes that will be used on the project. We will begin with a tailored version of our standard Project Management Plan (PMP) based on World Wide Project Management Method. Our team will work with MLTC to refine the processes, policies, and roles for each project management sub-plan.

- **Establish the Project Management Technical Environments (Tools).** The tools we will use include MS Project for project schedule development, IBM Program Work Center for integrated issue, risk, and action items management, SharePoint for document storage, and MS Office for general project management documentation.
- **Conduct the Project Kick Off Meeting.** The Project Kick Off Meeting is an important milestone in the Project Initiation and Planning phase. This meeting brings the project team together to establish a common understanding of scope, schedule, objectives, and roles and responsibilities.
- **Confirm the Preliminary Release Plan.** In this step, we will confirm the Wipro/IBM team understanding and assumptions regarding the high-level functionality required in each of the application releases and the timing of when the releases must occur.
- **Develop and Confirm the Deliverable Expectations Documents.** Our team will work with MLTC to define the specific content descriptions and formats and review the procedures and acceptance criteria for each of the deliverables and artifacts required for the project. The Deliverable Expectations Documents will be defined in order of schedule priority and complexity.
- **Prepare the Baseline Project Work Plan and Schedule.** Using inputs from the other Project Management Startup phase activities, an initial Project Work Plan and Schedule is developed for the project. The plan will include a detailed task plan for a set period of time and will continuously evolve on a rolling basis during the project.

Scope of Project Management Processes

Table IV-20: Project management Plan Activities below outlines the activities addressed within the Project Management Plan:

Table IV-20: Project Management: Plan Activities

PM Domain	Activities	Benefits to MLTC
Integration Management	<ul style="list-style-type: none"> • Assign PMP certified PM • Produce Project Management Plan • Produce Project Charter • Highlight interdependencies • Apply Change Management practices to the project • Execute project per the plan • Close project 	<ul style="list-style-type: none"> • Uses proven, repeatable methods • Drives continuous improvement and effective collaboration between the Wipro/IBM team and MLTC
Scope Management	<ul style="list-style-type: none"> • Confirm Work Breakdown Structure • Update Requirements Management Plan, Requirements Traceability Matrix, and Configuration and Change Management Plans • Execute, monitor, refine, and enforce scope 	<ul style="list-style-type: none"> • Establishes disciplined processes for managing scope to deliver tasks successfully, on-time, and within budget

PM Domain	Activities	Benefits to MLTC
Time Management	<ul style="list-style-type: none"> Produce draft Integrated Master Schedule (IMS) – to include key tasks, milestones, and interdependencies (both within and between tasks) Report monthly on progress against schedule 	<ul style="list-style-type: none"> Enables concurrent management of multiple project increments with clear understanding of interdependencies between tasks
Quality Management	<ul style="list-style-type: none"> Produce a Quality Control Plan, including detailed processes and procedures to be used Efforts taken promptly to address QA issues discovered during execution 	<ul style="list-style-type: none"> Proactive approach to managing quality Emphasizes continuous focus on quality issues Realizes fewer defects
Human Resources Management	<ul style="list-style-type: none"> Determine number and skill mix of resources required to execute project 	<ul style="list-style-type: none"> Identifies staffing needs up front and is managed through the Staffing Plan
Communications Management	<ul style="list-style-type: none"> Produce Communications Plan with project-specific requirements Execute, monitor, and refine, Communications Plan 	<ul style="list-style-type: none"> Facilitates effective stakeholder management, and enhances organizational change and training
Risk Management	<ul style="list-style-type: none"> Produce Risk Management Plan Execute Risk Mitigation strategies. - iv. Describe how the Bidder's implementation of its proposed PMP will address and balance such factors as quality, scope, time, and cost

Our approach for developing a solution is driven by an integrated methodology as defined above, while offering well-established project management. These methods provide the framework for managing our project team and helping to keep the project on track. Our project management methods address key management concerns and potential impacts to scope, schedule, cost, and quality, and are designed to provide the identified Deliverable Materials.

The Wipro/IBM team will manage the schedule and scope closely to ensure that we maintain the baseline release delivery schedule. The PMO will provide a written mitigation plan for any schedule delays that potentially impact the release delivery.

- v. Identify and describe all tasks and activities to be undertaken in the delivery of the EES and provide the associated timing of these activities.

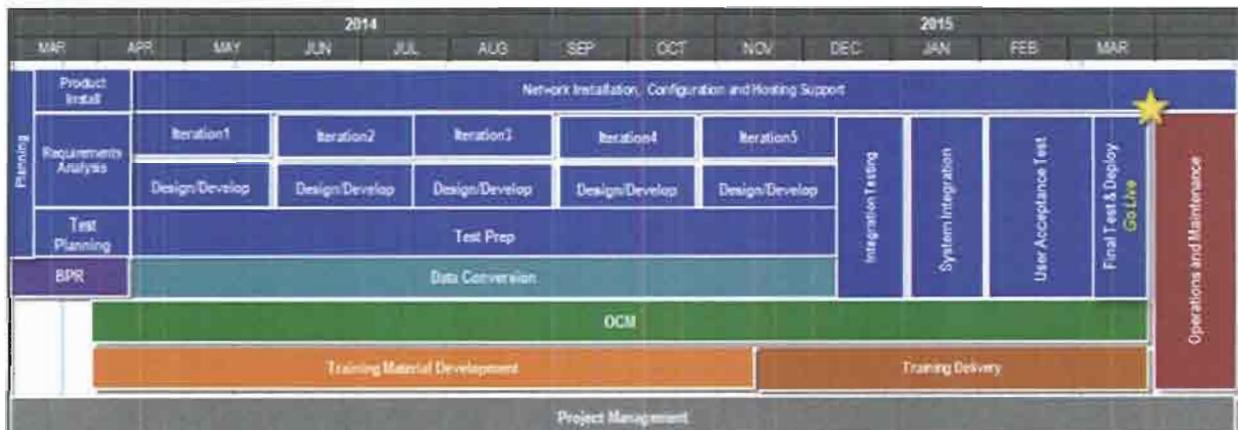

Figure IV-75: Tasks and Activities in Delivery of the EES

- vi. Describe how the Bidder decomposes deliverables and projects into a WBS and work packages.

We will subdivide the work into packages by identifying dependencies and creating relatively self-contained packages of work that are coherent and have few dependencies to other packages. For example, "*SmartPro MedEE* participant management" could be a work package. They will be scheduled by taking into account the dependencies and by scheduling higher-risk packages early using techniques such as technical proofs of concept that can be expanded later into full-function. This reduces overall project risk by eliminating technical risk early and reducing potential rework.

- vii. Describe the deliverables that will be produced at different milestones in the PMP

There are 12 deliverables that will be produced. For mappings of these deliverables to the 80 State deliverables requested, please refer to Table IV-21: Deliverables.

Table IV-21: Deliverables

	Deliverable	Phase	Description
1	Project Startup Review	Initiation, Concept, and Planning	This deliverable will establish project governance, a project schedule, status report templates, as well as plans for core pillars of the project (such as training and security). An initial version of all components of the Project Management Plan will be included in this document.
2	Architecture Review	Initiation, Concept, and Planning	This deliverable will include architectural and network diagrams, as well as begin to establish all of the physical environments required for the SmartPro MedEE project (from Sandbox through Production/DR)
3	Project Baseline Review	Initiation, Concept, and Planning	This deliverable will finalize the Project Management Plan deliverables as well other plans for baseline review. It will also complete setup of the physical environments
4	Preliminary Design Review	Requirements, Analysis	This deliverable will include initial use cases, process flows, and high-level design. It will include a data dictionary and will address gaps. SmartPro MedEE canned reports will also be identified
5	Detailed Design Review – 1	Design/Develop	This deliverable will include all of the design required to start development for Iteration 1, including finalized network, architecture and design documents, process models, and use cases.
6	Detailed Design Review – 2	Design/Develop	This deliverable will include all of the design required to start development for Iteration 2.
7	Detailed Design Review – 3	Design/Develop	This deliverable will include all of the design required to start development for Iteration 3.
8	Detailed Design Review – 4	Design/Develop	This deliverable will include all of the design required to start development for Iteration 4.
9	Pre-Operational Readiness Review (Integration)	Test	This deliverable will include test results for integration test
10	Pre-Operational Readiness Review (SIT)	Test	This deliverable will include test results for SIT, as well as training (delivery, competency, and assessment) reports
11	Pre-Operational Readiness Review (UAT)	Test	This deliverable will include test results for UAT
12	Operational Readiness Review	Implement	This deliverable will include all of the final

viii. Describe the Bidder's experience working with an IV&V Contractor

On government projects, our team has extensive working with IV&V contractors; in fact it is a requirement on all State projects. The IV&V contractor, who ultimately determine whether deliverables meet requirements (on the State's behalf), reviews all deliverables. Although the IV&V

contractor has a reporting relationship into the customer, they are tightly integrated into the team, with frequent meetings and daily touch-points.

- ix. Include a high level Project Schedule. The proposed Project Schedule deliverable must be broken down into Work Breakdown Structures (WBS) and must include key tasks, resources, milestones, deliverables, and task dependencies.

Please see attached draft project plan in the Tab entitled “Draft Project Work Plan” in this binder.

2. *Scope Management*

- i. Describe business processes and procedures for controlling the scope of the project and how they will differentiate between scope changes and progressive elaboration;

Scope management and control are critical factors for project success, particularly for achieving project milestones, key dates, and the timely completion of tasks. We anticipate and prepare for project scope change, enabling timely execution of the revised scope while eliminating or mitigating the impact to the project.

Requests to change project scope are not unusual over the course of a project. Some changes provide significant benefit to MLTC; others may be mandated by external agencies or circumstances. From our prior projects, we anticipate that, as the State and end users become familiar with the solution, they will identify additional functionality they desire, creating potential for “scope creep”. Within our Project Management methodology we have established processes for managing scope, which provide for incorporation of approved changes and provide visibility of the effect upon cost, schedule, and functionality.

Upon contract award, we take steps to familiarize Wipro/IBM team members with the contract requirements and SOW. Understanding contractual requirements is a fundamental step in delivering quality products on schedule and within budget while concurrently avoiding inadvertent incorporation of “out of scope” activities that could adversely affect project delivery.

The project scope baseline will be documented in the Requirements and Scope Baseline Document. This document will be validated by both the Wipro/IBM team and MLTC stakeholders and upon approval, will serve as the scope baseline document for the functionality that will be implemented.

The PMO function manages program and project level scope definition based on business goals. In defining the scope, the emphasis is to ensure that program objectives are measurable metrics and/or tangible deliverables. These are translated into individual project objectives to define the respective project level scope.

The Wipro/IBM Project Manager has responsibility for preparation of the Change Control process and for providing oversight for compliance with the plan during project execution.

Experience has shown us that starting with a COTS product designed for Health and Human Services helps to minimize the amount of changes that a project requires since we are able to use the COTS product during the requirements JAD sessions and it helps the MLTC project team to better visualize the final system.

ii. Describe how the business processes and procedures will control schedule, cost, time, and effort;

Once the Requirements and Scope Baseline Document is approved by the State and the Wipro/IBM team, we will move forward with the scheduled iterations per the schedule in order to configure and build the functionality in the Scope Baseline Document. Any changes and deviations that result in scope, schedule, or price changes will be documented by the individual team members in a Project Change Request (PCR) form and will be reviewed by the Wipro/IBM Project Manager and State stakeholders during periodic Change Control Board meetings. An approval from both the Wipro/IBM and State leadership teams will be required before the change documented in the PCR is implemented. Scope changes may also result in schedule changes and re-pricing.

As part of the change request business process, there will be a governance process which helps to determine if the requested change makes sense for the project, should be prioritized and in what phase of the project. *SmartPro MedEE* is built to be configurable and flexible. However, our experience has shown that many times users familiar with the existing system sometimes struggle to see the vision of the new system and will try to make changes to exactly recreate the legacy system in the new system. Our governance process will help us to evaluate if the requested change makes sense in terms of functionality, time to implement, cost and impact to the project schedule.

During each iteration, the team will create deployable product which will be configured, developed, and tested. The overall Project Scope management will be the responsibility of the Wipro/IBM Project Manager and during the planning phase, MLTC will help determine and finalize scope for each iteration. Each team will be given one or more “capabilities” to deliver within the release, and it is the team lead’s responsibility to prioritize and assign functionality from the agreed upon scope in for each iteration. The Wipro/IBM team leads in each project team will work alongside the Nebraska counterpart in managing scope for each iteration and may decide to move functionality to be implemented from one iteration to another. However, any deviations or changes in the baselined functionality in the Scope Baseline Document will be managed through the Project Change Request (PCR) process.

Our approach leverages *SmartPro MedEE’s* delivered capabilities to the extent possible. The Wipro/IBM team has assumed a certain number of customizations to *SmartPro MedEE* along with reports and interfaces, based on the requirements outlined in the RFP. Wipro/IBM will validate its assumptions related to the number and complexity of these customizations during the initial phase of the project. Should the actual number and complexity required by the State turn out to be different, the Wipro/IBM team will work with the State to discuss potential trade-offs. A net increase in the number of customizations will be managed through the project change control process.

iii. Describe any tools that will be used to control scope;

Rational team Concert will be the source of truth of the Requirements Traceability Matrix (RTM). The RTM will be used to control scope by showing that each detailed requirement is in support of a confirmed higher-level requirement or that each solution element is in support of a confirmed requirement. This reduces the risk of "scope creep" where additional requirements or overly complex solutions are introduced without control during requirements and design elaboration. If it turns out that a change in requirements or solution is needed, the RTM also serves to identify the impact on

other requirements and solution elements so that the cost and schedule impact can be evaluated more easily.

The Scope Management Plan, which will be updated in collaboration with the MLTC, will include additional detail regarding our approach to controlling scope. Additionally, the integrated project management methodology will provide for updates to impact project management plans, including Schedule, Cost, and other plans as appropriate.

iv. Describe how the Scope Management Plan will be implemented into the overall PM approach including any and all tools that are used;

The Scope Management Plan is created during the Planning Phase of the project where the majority of the Planning is defined and delivered.

The Wipro/IBM team will ensure effective Scope Management with the utilization of the following:

- Program Roadmap Development
- Change Control

Program Roadmap Development

A program roadmap helps an organization in navigating through the program's execution. It identifies critical program goals and a prescribed path to achieve them. Our program roadmap development process emphasizes integrating results of other PMO processes such as scope definition, risk and quality, execution planning, resource management and benefit management in building a quality program roadmap.

Our approach recognizes the importance of applying rigorous methodologies to process areas such as execution, resource, and costs to develop respective plans and determine the impact of their integration on the quality of the program roadmap. It is recommended that the program roadmap is published for review by all the stakeholders to secure the complete buy-in of the final document. Once approved and accepted any changes to the program roadmap can only be affected through a rigorous change management process defined in this framework.

The following diagram depicts constituent processes in the development of a program roadmap:

Figure IV-76: Program Roadmap Processes

- v. Describe how changes in scope will be presented to the MLTC, including but not limited to prioritization of changes, budget and schedule implications;

In order to ensure effective scope management governance, a Change Control Board (CCB) is created to manage and control changes through the life of the program. The proposed PMO framework identifies a rigorous change management process at the program and project levels based on the impact and nature of changes.

All scope changes will be documented and presented for approval, including:

- Description of the change
- Benefits
- Assumptions
- Approach/level of effort
- Priority (H, M, L) based on business impact
- Resources required
- Budget and schedule implications, if applicable

Changes will be prioritized in collaboration with State staff.

- vi. Describe how the PMP will be used to control scope.

The Project Management Plan will sub-divided deliverables into smaller, more manageable components at the work package level, each with a specific scope. Work is estimated and managed at the package level. Any scope that is outside of the baseline package will be managed through the change control process.

3. Requirements Traceability and Management

- i. Describe how requirements derived from stakeholder needs, wants, and expectations will be documented and categorized.

The Wipro/IBM team will define and document project requirements via Joint Application Definition (JAD) sessions conducted with the MLTC. The steps to be followed are:

- Define the project objectives
- Identify all MLTC touch points
- Collect data from the State
- Check the strategic alignment of the wants and needs with business drivers
- Identify business process characteristics and compare with the ideal
- Identify gaps and prioritize
- Knowing priorities and capabilities
- Make recommendations

The requirements definition document will define and categorize the functional, non-functional, and technical requirements. The requirements definition document is created during the delivery phase of the project in conjunction with Joint Application Definition (JAD)/workshop sessions. The intended audience is the project manager, project team, project sponsor, client/user, and any stakeholder whose input/approval into the requirements definitions process is needed. Each business requirement will be assigned a unique ID number which is inherent to the IBM Rational Requirements Composer.

Rational Requirements Composer (RRC) is a web-based team environment that is an integral component of the Rational Jazz Platform. RRC will enable the IBM team to organize and manage requirements as specifications with modules and collections, tracking each requirement as an artifact record, and grouping related requirements into logical structures based on high-level business processes.

Figure IV-77: Rational Requirement Composer

Requirements and their associated mappings to test suites, test cases, and test scripts within RQM can be viewed within RRC in both grid and tree views to help the IBM testing team understand the relationships between various requirements, and to see the visual representation of complete requirements traceability.

RRC regularly collects metrics at daily intervals to enable quick and up-to-date reports, which can be easily distributed to appropriate stakeholders within the MLTC. The Wipro/IBM testing team will be able to provide reports indicating:

- Requirements coverage by test type;
- Requirements coverage by test suites, test cases, and test scripts;
- Requirements linked to other Work Items, such as defects.

ii. Describe how requirement changes will be analyzed and managed to ensure scope creep is identified and avoided.

Requirement changes, if not documented and controlled correctly, can become a single point of failure for projects. In order to mitigate this risk, the Wipro/IBM team will document a configuration management plan that will outline practices for release management and change management. These processes will identify timelines and approval levels where both the State and the Wipro/IBM team will be involved before changes to a configuration item can be implemented or distributed.

Wipro/IBM’s overall approach to requirement changes will be governed by a change management plan. This plan will be used to request, evaluate, implement, and review changes to the system. Change Management is used for both planned and unplanned releases of software (e.g. critical defects)

Wipro/IBM will setup a Change Control Board (CCB) consisting of all relevant parties, namely MLTC business team and Wipro/IBM team. CCB reviews, assesses, approves, or rejects all changes to the MLTC environment. Changes are organized into three categories: routine-simple, planned-complex, and emergency. Each of the categories includes dedicated staff engaged to verify the change is executed completely and accurately. Change management is also integral to our release and patch management process, where we will follow best practices for installation of critical patches. Figure IV-78: Change Management Process illustrates our high-level procedures.

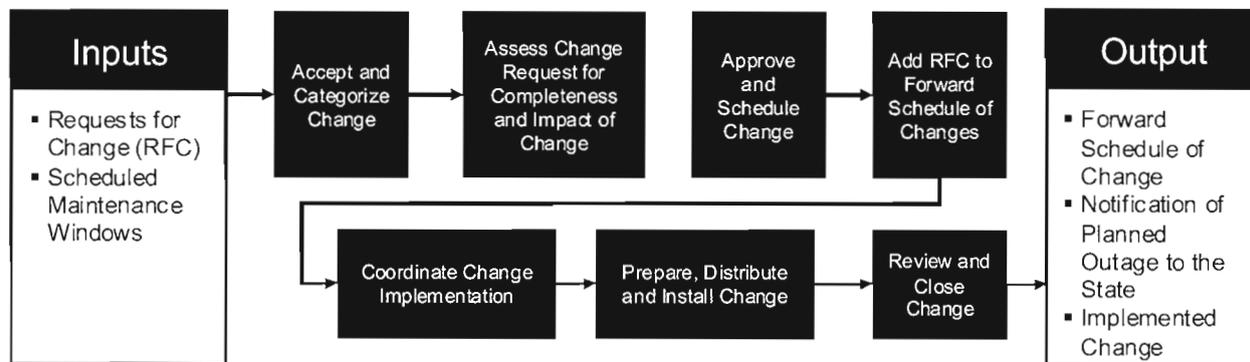

Figure IV-78: Change Management Process

When a change request has passed the initial review of the Change Control Board, we will make an initial assessment of the cost, schedule, and resources needed to implement the proposed change. If the requested change is complex, a Cost and Schedule Impact Analysis (CSIA) should be requested. This will be indicated and an estimate of the cost, schedule, and resources needed to perform the

CSIA will be made. The Change Control Board will once again review the requested change and either accept, reject, or defer.

iii. Describe how requirements will be tracked, documented, and versioned.

Requirements will be gathered, tracked, managed, base lined, versioned using IBM Rational Requirements Composer (RRC). RRC is a tool that empowers us to define, manage, and report on requirements in a lifecycle development project. This web-based application supports iterative, waterfall and agile-at-scale development methodologies using lightweight requirements processes.

In RRC variety of artifacts can be leveraged, in it. These can include - Rich Text, Multiple Glossaries, Models, and User Interface (UI).

Adding and Tracking a Requirement

- From the 'Meeting Minutes' document above, Analysts decide that a new term has arisen that should be added to Glossary, in order to ensure consistency should it arise again.
- The team also realizes that they now have a new formal requirement, and denote it as such via right-clicking text and selecting 'Mark as Requirement', so that it can be managed moving forward, in the lifecycle.

- Additionally, post a process change has been 'brainstormed'. In addition to inserting a picture of this design change from the whiteboard into the repository, the analysts will tie that change to the appropriate design models.

Versioning of a Requirement

Versioning exists for each artifact. Each change to the artifact is shown in a timeline across the top (in the History view), allowing easy rollback to previous versions.

Figure IV-79: Versioning of a Requirement

- iv. Describe in detail the documentation deliverables that will be produced as a result of the requirements analysis and provide samples of the documentation.

The following deliverables will be produced as part of requirement analysis.

- System Architecture Diagrams
- Requirements Traceability Matrix
- Non Functional Requirements
- Use Case Model
- Network requirements
- Security and Privacy requirements

- v. Describe the tools and business processes that will be used to track requirements throughout the SDLC.

IBM Rational Requirements Composer will be used to track requirements throughout the SDLC.

Requirements and Traceability plans will be managed in IBM Rational Requirements Composer, Test plans and Test cases will be managed in IBM Rational Quality Manager software, Implementation of features/tasks will be managed in IBM Rational team Concert, Defects will be managed in IBM Rational team Concert. team creates the traceability between Requirements, Test cases to project artifacts, Defects etc. This way Platform helps to manage overall real time traceability.

- vi. Describe how the Requirements Management and Traceability Plan will be implemented into the overall PM approach including any and all tools that are used.

The Requirements Management Plan will be implemented within the overall Program Management Plan according to Wipro/IBM's submitted policies, procedures, and tools. Examples of the Requirements Management tools are:

- IBM Rational Requirements Composer
- IBM Rational team Concert

Requirements and Traceability plans will be managed in IBM Rational Requirements Composer, Test plans and Test cases will be managed in IBM Rational Quality Manager software, Implementation of features/tasks will be managed in IBM Rational team Concert, Defects will be managed in IBM Rational team Concert. team creates the traceability between Requirements, Test cases to project artifacts, Defects etc. This way Platform helps to manage overall real time traceability.

- vii. Describe how requirements will be stored in a repository and how the State of Nebraska and stakeholders will access the information about a requirement.

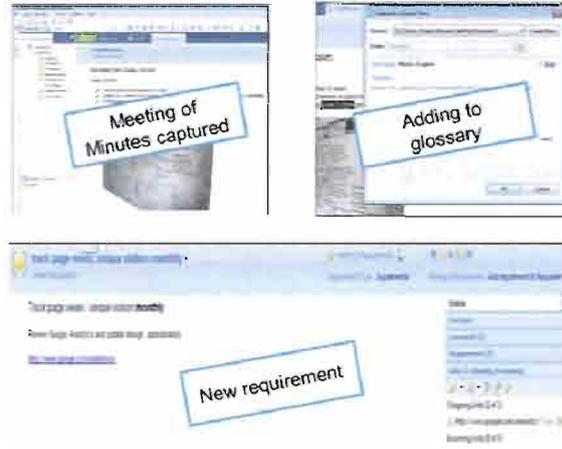

Requirements can be gathered, tracked, managed, base lined, versioned with the help of IBM Rational Requirements Composer (RRC). It attempts to exist earlier in the lifecycle, where requirements are first defined. This matches the current trend, whereby business-side resources can contribute more fully on projects, using various 'vocabularies' to collaborate on ideas. RRC seeks to serve two audiences: Analysts (who author), and Stakeholders (who review). Ultimately, it can thus serve as a collaborative repository for organizing, creating, refining, and reviewing requirements and

their related materials. This can shorten duration and increase your competitiveness in a demanding market; and also lower costs through better communication and less rework.

In RRC variety of artifacts can be leveraged, in it. These can include - Rich Text, Multiple Glossaries, Models, and User Interface (UI).

Adding and Tracking a Requirement

- From the 'Meeting Minutes' document above, Analysts decide that a new term has arisen that should be added to Glossary, in order to ensure consistency should it arise again.
- The team also realizes that they now have a new formal requirement, and denote it as such via right-clicking text and selecting 'Mark as Requirement', so that it can be managed moving forward, in the lifecycle.
- Additionally, post a process change has been 'brainstormed'. In addition to inserting a picture of this design change from the whiteboard into the repository, the analysts will tie that change to the appropriate design models.

Versioning of a Requirement

Versioning exists for each artifact. Each change to the artifact is shown in a timeline across top (in the History view), allowing easy rollback to previous versions.

- viii. Describe business processes and procedures that will be used for tracking requirements from design through configuration/coding, acceptance, unit, and integration testing, as well as promotion into production.

The Wipro/IBM team will trace all project requirements via Requirement Traceability matrix Using Rational Requirement Composer. Requirements traceability and testing can be thought of as inseparable work streams, as one cannot be fully satisfied without the other. The Requirements Traceability Plan will describe the processes needed to identify the project requirements, and how to document those requirements in a system that enables bidirectional traceability. The Requirements Traceability Plan will outline how both Wipro/IBM and the MLTC will manage changes to those requirements. The Requirements Traceability Plan will also describe a process to achieve commitment to the in-scope State requirements and identify variations between these requirements and the project work.

The Requirements Traceability Plan will document how the Wipro/IBM team will identify, organize, assess, and track the project functional and non-functional requirements throughout all three project phases. The requirements management process will establish a collective understanding among Wipro/IBM, the State, and existing system participants regarding the functional, technical, and operational need to be addressed and supported during project execution.

Table IV-22: Requirements Traceability Activities

Stage	Requirements Traceability Activities
Solution Outline	Meet with Subject Matter Experts (SMEs) to: Confirm a mutual understanding of in-scope business requirements; Confirm and review our proposed Solution Architecture and assess its impact on the project requirements; Review the State if MLTC's existing systems, applications, and organization to assess impact on project requirements.
Macro Design	Establish baseline set of in-scope functional and non-functional requirements, and load those requirements into Rational Requirements Composer (RRC). Review baseline set of Use Cases and map to requirements loaded in RRC; update loaded requirements based on Joint Application Design (JAD) sessions
Construction and Solution Test Preparation	Map Unit and Integration Test Cases and Test Scripts to requirements loaded in RRC. Iteratively review Unit and Integration Testing progress and results with the State to identify requirements as candidates for modification or removal through Change Requests (CRs). Produce and review periodic requirements coverage reports with the State. Begin mapping Solution Test Execution Test Suites, Test Cases, and Test Scripts to requirements loaded in RRC.
Solution Test Execution	Finish mapping Solution Test Execution Test Suites, Test Cases, and Test Scripts to requirements loaded in RRC. Iteratively review Solution Test Execution progress and results with the State to identify requirements as candidates for modification or removal through Change Requests (CRs). Produce and review periodic requirements coverage reports with the State.

4. Issue Resolution Management

- i. Describe business processes and procedures that will be used for the identification, definition, and evaluation of project issues related to the EES

The Wipro/IBM team will provide a standardized method for dealing which focuses on reviewing the issues in the context of the issue's effect on the entire project. Therefore, proactive issue management helps to prevent risks and negative project outcomes as well as avoid greater costs to for mitigation and firefighting efforts. The issue management process will be reviewed weekly with the project management staff, which will result in action assignments to disposition the issues if necessary.

Commitment to resolving issues jointly and swiftly facilitates successful project completion.

The *SmartPro MedEE* project will be managed proactively with an emphasis on team-based problem solving. The Wipro/IBM team will implement processes to identify potential issues and develop plans to mitigate their effects. Our team approach enables the team to quickly identify potential issues and initiate the appropriate corrective actions before issues become major problems. The Wipro/IBM team will use the following methods to identify potential problems and issues:

- The project work plan, project control tools, and standard processes will be maintained and reviewed to monitor progress against project milestones, thereby providing important information for identifying problems with the schedule and resources.
- Wipro/IBM team process and supporting tools will identify, document, and track project issues. This will yield valuable information that can be used to identify issues of policy, design, technology, implementation, and operations.
- Weekly status meetings will provide a forum for alerting key personnel to potential issues as well as for planning and initiating appropriate corrective actions.
- Project plans will enable the Wipro/IBM team to adjust the project schedule quickly when necessary by shifting resources from less critical to more critical tasks.
- Scheduled reviews by experienced managers and information technology specialists not regularly assigned to the project will provide fresh perspectives on key operational and technical issues.

Weekly meetings will be held between the MLTC and the Wipro/IBM management teams specifically to address issues and determine the appropriate course of action. Issues may range from requirements clarifications and adjusting build strategies to approving User Acceptance Testing scenarios. Working as a unified, committed team enables the swift resolution of issues that could potentially hinder project progress

ii. Describe how the processes and procedures will differentiate between an issue and a risk;

A risk is an “uncertain event or set of circumstances that, should they occur, will have an adverse effect on the achievement of the project or program objectives”. An issue is an “event that has happened which is adversely affecting the project or program objectives”.

Both issues and risks are identified, assigned an owner, logged, and given a set of actions. However, the way they are identified, and what occurs with them after identification differs.

Methods of risk identification include: Joint Application Development, Interviewing and Diagramming, SWOT (Strengths, Weaknesses, Opportunities, and Threats), and Industry Trends and Analysis. A risk management log will be generated and updated. A top 10 high-risk list will be managed daily by the PMO team. This priority will be driven by a combination of probability of occurring and impact.

Issues are identified once they occur. Once identified, root cause analysis is performed, and the issue is prioritized by team lead based on criticality and complexity of the issue.

iii. Describe how the business processes and procedures will be used to resolve issues;

Figure IV-80: Issue Management Procedure depicts the process we will follow to prioritize and resolve issues.

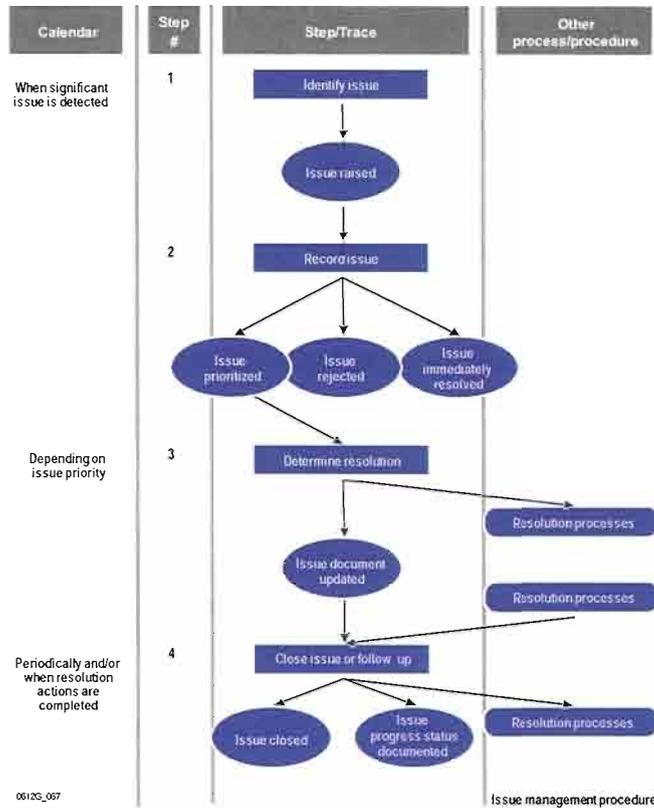

Figure IV-80: Issue Management Procedure

iv. Describe the tools that will be used to document, track and manage issues and document issue resolutions;

The Issue Management Tool that will be used to document, track and manage issues and document issue resolutions is the IBM Rational team Concert. Issues will be logged in the weekly status report, logged into the issue tracking database by the members of each team, and reviewed weekly by the project management team. The issue tracking database will be used to determine the status of outstanding issues and the resolution of closed issues. This will ensure that issues are resolved in a timely and accurate manner. IBM Rational team Concert will be used as an issue management tool.

v. Describe how the Issue Resolution Management Plan will be implemented into the overall PM approach including any and all tools that are used; and

The Issue Resolution Management Plan will include:

- Issue identification and documentation
- Prioritization and categorization rules
- Tracking procedure
- Escalation procedure
- Issue Monitoring
- Communication
- Closing

IBM Rational team Concert will be used to log and track issues. Escalation and communication will also occur through status reports.

vi. Describe how the tools will be used to support State of Nebraska and stakeholder access to information about issue resolution.

Issue resolution will be stored in IBM Rational team Concert. We can provide MLTC access to the tool over the Internet. As per license agreement with IBM we can provide review and approval access to customers for issues documents.

5. Risk Management and Resolution

i. Describe business processes and procedures that will be used for:

a. Identifying and defining risks

Risk identification involves the project team and appropriate stakeholders, and includes an evaluation of environmental factors, organizational culture, and the project management plan including the project scope, schedule, cost, or quality. Careful attention will be given to the project deliverables, assumptions, constraints, WBS, cost/effort estimates, resource plan, and other key project documents.

Methods to identify risk include the following:

- Joint Application Development
- Interviewing and Diagramming
- SWOT (Strengths, Weaknesses, Opportunities, and Threats)
- Identified or encountered risks from other *SmartPro MedEE* projects coupled with their risk mitigation plan
- Industry Trends and Analysis

b. Tracking and monitoring risks

A risk management log will be generated and updated. A top 10 high-risk list will be managed daily by the PMO team.

c. Quantifying, qualifying and prioritizing risks; and

Figure IV-81: Risk Assessment Matrix below displays a risk assessment matrix. Risks in the High areas portray a high probability of occurrence and a high level of impact. Risks in the Medium areas have a medium probability of occurring or medium impact, and risks in the Low areas have a low probability of occurring and low impact. The process for determining risk impact will be determined with the MLTC during the Project Initiation and Planning phase as part of the project management plan development.

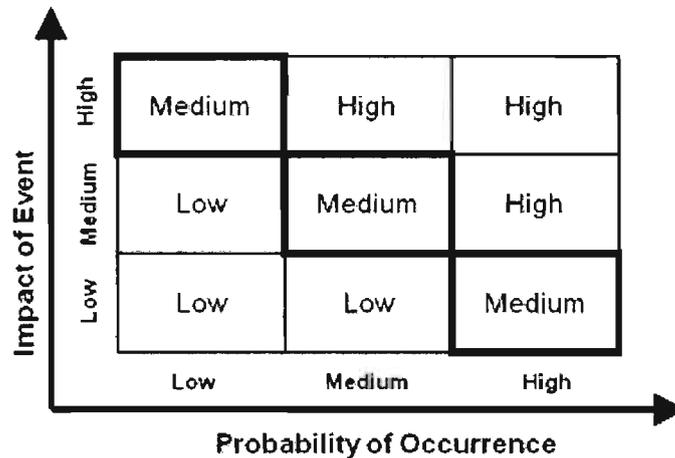

Figure IV-81: Risk Assessment Matrix

Risk impact is measured by impact on time, quality, or cost (high: >10%, medium: 5-10%, low: < 5%). Probability is measured as the likelihood of occurring (high > 50% chance, medium: 10-50% chance; low: < 10% chance).

d. Mitigating of risks

A mitigation strategy to reduce the likelihood and/or the consequences will be planned and executed. The likelihood and impact of the risk will be quantified once the action is taken. Available mitigation strategies are often a blend of the following:

- Prevention - If the consequence is too great, stop or change approach to prevent the risk happening.
- Reduction - If the risk cannot be avoided, determined ways to reduce the potential impact.
- Acceptance - If the impact is tolerable and avoidance prohibitive/impossible it might be best to plan how to manage the fall-out should the risk materialize.
- Transference - Move the risk elsewhere, either into another party (for example, financial), or onto another objective (for example, shuffling resource).
- Contingency - Create a contingency plan to implement if this risk materializes.
- Risks with ratings of “High”, “Severe”, and “Extreme” must be mitigated.

ii. Describe processes and procedures that will be used for risk assessment;

The process for the Risk Management Plan includes begins with risk identification and is followed by risk analysis, where the severity, timeliness, and costs of mitigation are assessed. We then plan the mitigation strategy for each risk. Finally, we track and report the status of each risk as part of our management and status reporting process. This process is illustrated in Figure IV-82: Risk Management Plan Process.

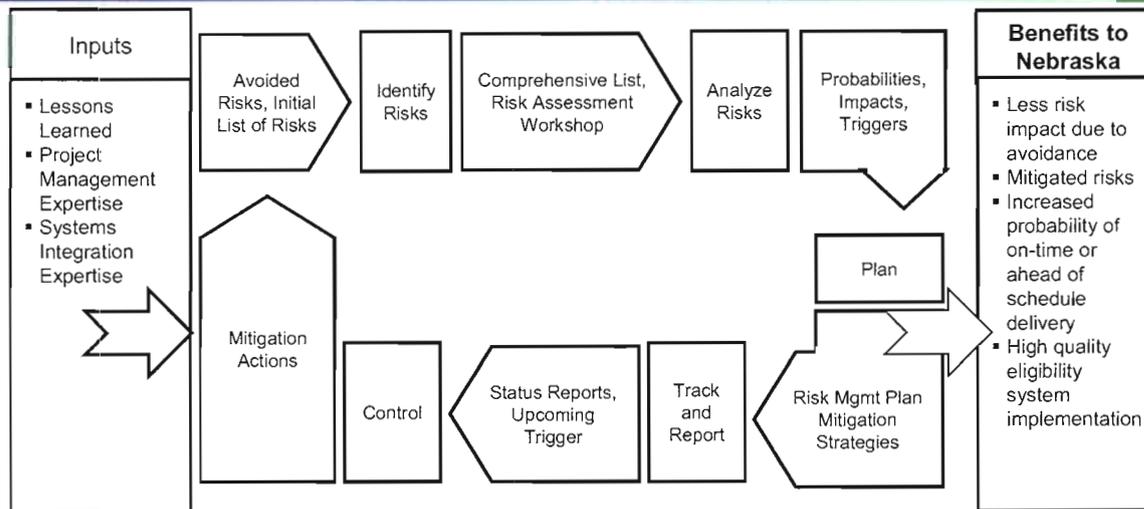

Figure IV-82: Risk Management Plan Process

iii. Describe processes and procedures that will differentiate between an issue and a risk;

A risk is an “uncertain event or set of circumstances that, should they occur, will have an adverse effect on the achievement of the project or program objectives”. An issue is an “event that has happened which is adversely affecting the project or program objectives”.

Both issues and risks are identified, assigned an owner, logged, and given a set of actions. However, the way they are identified, and what occurs with them after identification differs.

Methods of risk identification include: Joint Application Development, Interviewing and Diagramming, SWOT (Strengths, Weaknesses, Opportunities, and Threats), Lessons Learned from other *SmartPro MedEE* projects and a review of their risk logs, and Industry Trends and Analysis. A risk management log will be generated and updated. A top 10 high-risk list will be managed daily by the PMO team. This priority will be driven by a combination of probability of occurring and impact.

Issues are identified once they occur. Once identified, root cause analysis is performed, and the issue is prioritized by team lead based on criticality and complexity of the issue.

iv. Describe the tools and techniques that will be used for

- a. Risk identification
- b. Risk documentation
- c. Risk management
- d. Risk analysis.
- e. Risk logging and;
- f. Risk mitigation

IBM Rational team Concert will be used in the identification, documentation, analysis and logging of risk per the Risk and Issue Management process.

The formal Project Management process template in Rational team Concert provides Risk and Risk Action work items for risk management.

Our team will identify risks using the following techniques:

- An initial set of risks will be identified using the IBM GS Risk tool. This tool contains a master checklist of potential risks by type of project - our team will select any that are applicable to projects of this type and tailor the recommended mitigation plans provided by the tool for this specific project. We will then transfer them to Rational team Concert for ongoing management
- Each team will hold risk identification brainstorming meetings at major milestones to identify any potential emerging risks.
- The change management process will also include identification of risks that might emerge as the result of changes if accepted.

v. Describe how the Risk Management Plan will aggressively monitor risk and identify triggers to risk events;

Risks will be regularly monitored and reviewed to determine if the planned actions reduce the risk in terms of impact and likelihood as planned or if new factors (internal or external) alter the risk quantification.

vi. Describe how the Risk Management Plan will be implemented into the overall PM approach including any and all tools that are used; and

The Risk Management Plan will include the risk management procedure, including:

- Risk identification and documentation
- Risk analysis – quantitative and qualitative
- Risk response planning
- Risk monitoring, closing and reporting

A risk log will be maintained in Rational ClearQuest by the project manager and will be reviewed as a standing agenda item for project management team meetings. Top 10 Risk Items will be fully reviewed at Executive Steering Committee meetings.

vii. Describe how the Risk Management Plan will address the risks of a single or phased EES implementation and provide aggressive mitigation strategies, including how the single or phased implementation will be leveraged to ensure a successful transition

The Wipro/IBM team has built the project plan based on a one-year implementation cycle with iteratively scheduled work packets. There is the opportunity to include or modify the project plan for a quick win. We have found that breaking the work into logical functional work packets lowers the risk of the overall project. Further, our approach of end user involvement in the JAD requirement sessions coupled with the use of the COTS product also lowers the risk to this approach as the users see the application before the design, configuration, implementation, and testing phases.

The Wipro/IBM team has developed a comprehensive implementation approach for *SmartPro MedEE* to enable the MLTC to achieve a successful implementation. Critical to the success of the implementation plan will be identifying risks associated with the approach as early as possible, developing comprehensive mitigation strategies, tracking the risks and should the risk arise, transitioning it aggressively into the Issue Management process. Figure IV-83: Risk Management Process depicts the Risk Management process that will be utilized throughout the duration of the engagement.

Figure IV-83: Risk Management Process

Fundamental to the success of the risk management process, is reviewing the risks by the project leadership at a consistent frequency. The Wipro/IBM team will conduct weekly meetings with MLTC leadership to review the risk and mitigation strategies so that any risk whether it is technical, organizational, requirements or staffing will have the appropriate visibility and the mitigation plan is accepted by all.

6. Configuration Management

i. Describe how changes will be tracked, documented, and versioned;

The Change Management process must be documented and followed in order to control project scope. During the Initiation, Concept, and Planning Phases of the CSPMM, the Wipro/IBM Team intends to validate the requirements and assumptions outlined in this proposal and baseline the scope of each project phase as required. The Project Baseline Document will be reviewed with the appropriate State of Nebraska stakeholders to get approval and will be used throughout the entire project lifecycle to manage and control scope of the projects.

Deviation and changes from the scope throughout the project will be managed through the Project Change Request (PCR) process which will be required to go through a structured Change Control Board's approval prior to making/accepting any changes in the project baseline. The Change Control Board will be a collaborative team consisting of members from the Nebraska MTLC and Wipro/IBM team. Only those members who are authorized to make decisions on scope, schedule, and price changes will be involved in this process. The team intends to follow a structured process using standard templates that are part of the CSPMM process. This includes change management templates to ensure successful continuity of operations.

The Wipro/IBM team members will identify the changes requested by the State team members, and changes that arise during the system implementation phases. The Change Requests will be documented in a Project Change Request (PCR) template which will include the description of the change along with the scope, schedule, and price impacts due to the change. The Wipro/IBM

Project Manager will be responsible for reviewing the PCR with the Change Control Board, and upon approval of a PCR, will authorize the IBM team members to proceed with changes. If a PCR is not approved, the change will not be implemented. All changes will be stored in a centralized repository that will be mutually agreed upon by the Wipro/IBM Team and the State of Nebraska.

- ii. Describe how changes will be synchronized and distributed when multiple activities are occurring simultaneously across multiple environments (e.g. sandbox, configuration/development, test, quality assurance, production, training, and disaster recovery);

Configuration management, if not documented and controlled correctly, can become a single point of failure. To that end, regardless of the environment be it sandbox, configuration/development, test, quality assurance, production, training, and disaster recovery, the end goal is to mitigate the risk for the State of Nebraska, and all parties relying on the successful operation of the *SmartPro MedEE* system. In order to mitigate this risk, we will document a configuration management plan that will outline practices for release management and change management consistent with the CSPMM. These processes will identify timelines and approval levels where both the State of Nebraska and the Wipro/IBM team will be involved before any configuration item or custom code can be promoted to the Production environment. A configuration management plan will be issued for each major and minor release. Synchronization efforts between teams will be identified as part of the deliverable scheduling areas of the configuration management plan.

- iii. Describe any tools and business processes that will be used to control software development, including check in/check out procedures and a responsibility audit trail;

Source code and technical change management will be managed using IBM Rational team Concert. Rational team Concert (RTC) is an optimal solution because it has the ability control code that is part of the full software development life cycle from creation to management. Source code management as part of RTC is built on a component-based JAZZ control architecture. RTC enables for code management to be distributed across varying geographies as the product supports parallel, waterfall, and agile software development methodologies. RTC offers features such as defect tracking, build integration tracking, and process automation. Source control can be control or feature driven. Code reuse and management capabilities within RTC.

Change Sets: This change set storage model, as part of RTC, provides atomic changes to sets of files. Change sets are considered a baseline for code management and can be shared (via work items), suspended, discarded, and reverted across developers, teams, or geographies if appropriate.

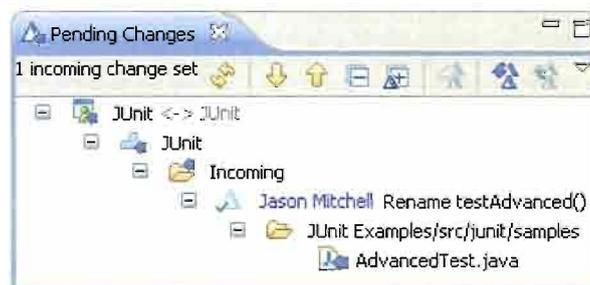

Figure IV-84: RTC Change Sets

Streams: When a team is responsible for a specific code set, RTC establishes a Stream for the teams or project owner to manage the activities as needed for the code baseline. Streams can be created easily for ad-hoc collaborations, and streams can be created from builds to reproduce shipped products. In addition, streams provide an efficient scaling mechanism where sub-teams can be isolated and flow their changes into stream hierarchies as integration is needed.

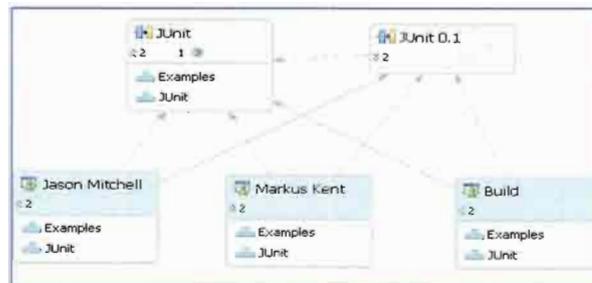

Figure IV-85: RTC Streams

Component Development: A system such as the *SmartPro MedEE* will undoubtedly include a complex code based. Instead of combining all change sets in the same namespace for the system, the use of RTC enables for component-based deployment. This means that there are various ways to manage code in the same repository without having to impact the entire set of system code.

Task Integration: Because code is managed in code sets, tasks can be suspended and resumed as needed within a change set without impacting an entire set of application source code.

Move and Rename Tracking: RTC offers full support for tracking file, renaming files, and moving in addition to support for merging structural conflicts.

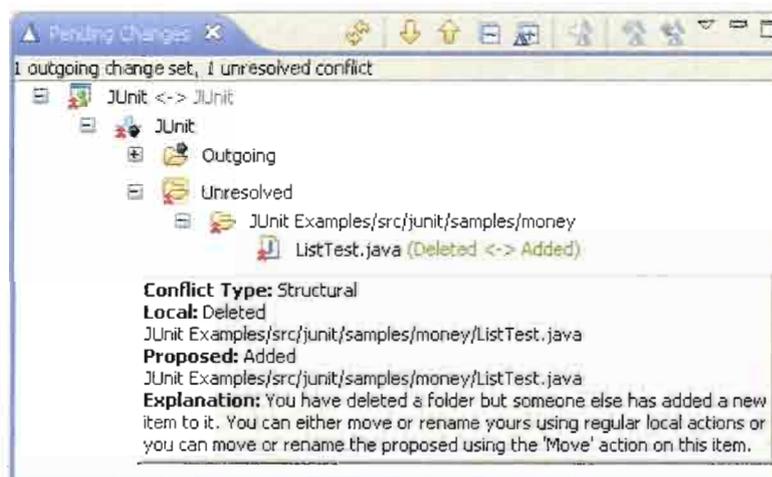

Figure IV-86: Move and Rename Tracking

Full Administrative Control to Delete Contents from Source Control: An administrator, as determined by project leadership and the Change Control Board, can delete the content associated to the version of the source code. Approval would be required for changes to be made to every environment except development.

Within the development team, changes will be documented using a combination of RTC and ClearQuest. Code changes will be documented and ownership will be clearly delineated. To the greater MLTC project team and State leadership, the control review board process includes steps to ensure change request closure is documented. A routine communication will be sent out to the appropriate parties to articulate the system modifications and impact to the user community as required. Change messaging delivery formats will be mutually agreed upon between the MLTC and the Wipro/IBM team for each incremental incident.

iv. Describe how the Configuration Management Plan will be implemented into the overall PM approach including any and all tools that are used;

The Configuration Management Plan is initially created during the Initiation, Concept, and Planning Phases of the project. The Wipro/IBM team uses a structured configuration management plan template, the MLTC SDLC Template. Configuration Management activities are supported using IBM Rational ClearQuest 8.0 as the preferred configuration management tool.

Our overall objective when executing and preparing a Configuration Management (CM) Plan is to document and inform project stakeholders about CM with the project, what CM tools will be used, and how they will be applied by the project to promote success. Key objectives in a CM plan include:

- Identifying, defining, and establishing a baseline for configuration items
- Controlling modifications and releases of configuration items
- Reporting and recording status of configuration items and any requested modifications
- Ensuring completeness, consistency, and correctness of configuration items
- Controlling storage, handling, and delivery of the configuration items

Each Configuration Management Plan is built on three core objectives: organization impacts, training impacts, and requisite activities. To elaborate further, the details in each section may include:

- **Organization:** Potential organizational impacts from CM activities, what organizational policies, and procedures may be impacted and organizational interfaces between organizations that may impact configuration management efforts.
- **Training:** Identify the kind and amount of training necessary to bring the performing organization up to speed on what configuration management is, any tools used to perform CM activities, and what, if any, impact CM may have on how work is performed. This may include development team orientation, tools training, and organizational awareness.
- **Activities:** The activities can contain one or more of the following requisites:
 - Configuration Item Management
 - Configuration Identification and Exploration
 - Artifact Lifecycle Reviews
 - Configuration Control Reviews
 - Configuration Audits and Reporting

Collectively, this holistic approach to configuration management provides the intuitive processes required to easily managing a large project such as *SmartPro MedEE*; a sufficient number of checks

and balances for operational continuity are implemented from the onset of the project and can be implemented as needed throughout the entire lifecycle.

- v. Describe business processes and procedures that will be used for controlling the migration of code from design through coding, acceptance, unit, and integration testing, as well as promotion into production. Explain how proposed changes will be communicated to the stakeholder.

The application hosting infrastructure hardware and software configurations are managed and maintained throughout the configuration management solution deployment process. We design, plan, and maintain the physical and logical configurations of hardware and software components. Changes to configurations are applied at installation or during our maintenance windows which are communicated through the change management process. Notifications are sent to the appropriate stakeholders through regular electronic communications, including emergency releases as appropriate. The process for managing the entire configuration management lifecycle as proposed by Wipro/IBM is described in Figure IV-87.

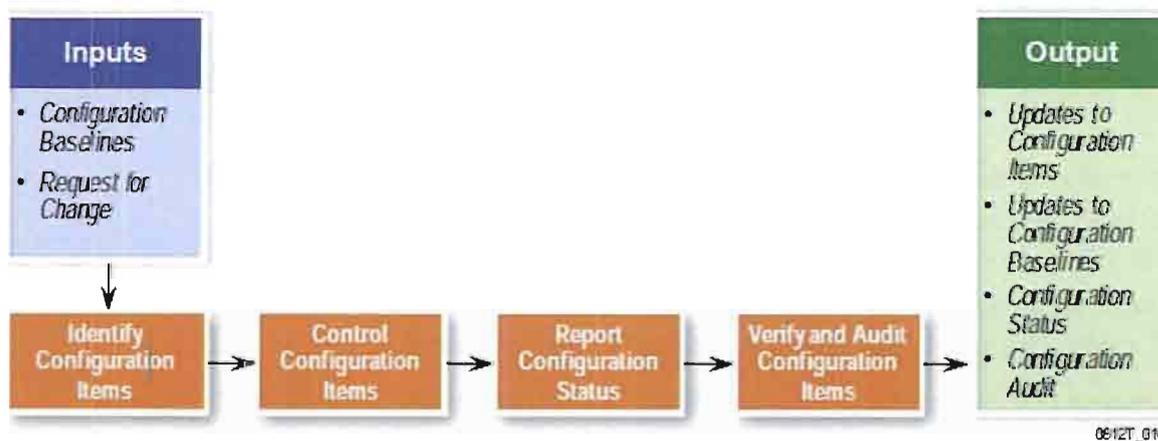

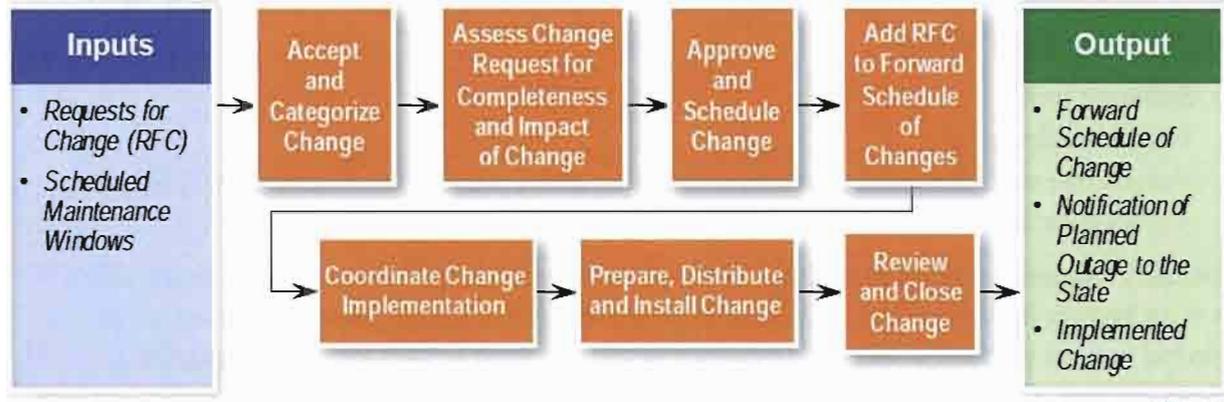

Figure IV-87: Configuration Management Process

- vi. Describe how changes to the environments will be controlled so that no changes to hardware, software, or operational procedures will be implemented without the State of Nebraska’s review and approval;

Part of any change management control process is ensuring that changes made during a subsequent deployment do not have any impact to operations. Operational controls must be put in place to ensure that all the appropriate authorizations are gathered and agree to a change in a given environment. As part of the management of the system environment, the Wipro/IBM team reviews, assesses, approves or rejects all changes to the State’s environment. Changes are organized into three categories: routine-simple, planned-complex, and emergency. Each of the categories includes dedicated staff members engaged to verify the change is executed completely and accurately so that no changes are made which can adversely affect operations. This process allows for the MLTC to approve all changes prior to being put into a production-ready state. Change management is also integral to our release and patch management process, where we will follow best practices for installation of critical patches. The change management procedure process is described in Figure IV-88.

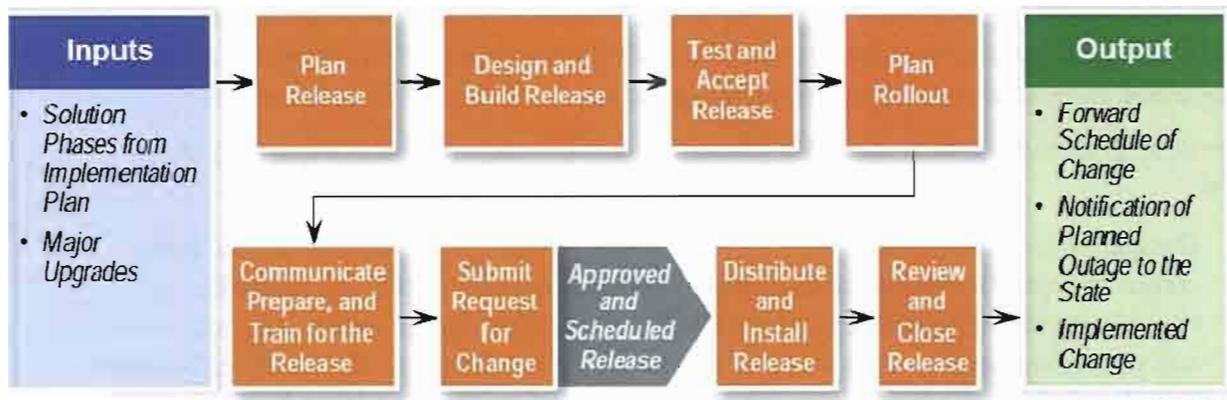

0812T_008

Figure IV-88: Change Management Procedure Process

- vii. Describe the software development management process that will be used, including the migration of code from design to production. This description shall include diagrams and other graphical representations to communicate the processes

Release Management is the software development management process that will be used by the Wipro/IBM team to handle the migration of code from design to production. The use of release management is considered the highest and most delicate level of configuration management as it is the control process that enables for deployment of a major system release.

A release will be defined within the configuration management tools, and all artifacts under configuration control will be traced to one or more of the releases. Major releases are associated with a *SmartPro MedEE* implementation phase or maintenance agreement. Minor releases are associated with functional increments within the major releases, such as defect fixes and approved change requests. The full release management lifecycle is described in Figure IV-89.

0812T_009

Figure IV-89: Release Management Procedure Process

- viii. Identify the types of configuration changes that can be made. Categorize the changes in terms of functionality, testing requirements, quality of change and the extent of the change in terms of immutability and retractability;

As part of any release, there are several change types that may be identified. Usually it falls into changes that require a change to:

- Software code,
- Hardware sizing, or
- Process oriented change such as defined by rules and workflow modifications which can impact both the software and hardware

Functionality changes are often modifications in software code and process. A change in the way a screen must present information, a data input requirements (i.e. a validation requirement), or how an approval process works (i.e. verifying evidence associated with a case) are often examples of functional changes. Once a change is made to software code or a process, it must be tested in various environments before being deployed to production.

As part of the Development as well as the Implementation phase of our *SmartPro MedEE* project, configuration changes can be made. The primary objectives of the two phases are 1) complete the application configuration and development of the individual solution components according to the high level design specifications and 2) confirm that the components meet the quality standards required to proceed to the integrated testing of the end-to-end solution.

The three primary activities (Design, Develop, and Unit Test) are performed in a structured and iterative manner. The benefits of iterative construction are:

- Ability to verify working software against user and technical requirements early and often
- Ability to address high risk areas early without waiting for the entire design cycle to complete
- Ability to demonstrate achieved value

Not only does our methodology promote iterative development within multiple phases, the methodology promotes incremental development so that configuration changes can begin as soon as Requirements Analysis artifacts are completed and reviewed for a segment of the application, usually a discrete functional area (e.g. Intake, Case Management, etc). This allows for discrete retraction and immutability so that no one change can impact system wide performance

Further descriptions of the three activities (Design, Development, and Integration Test) are as follows:

- **Design.** During the Design Phase, any additional design details required for the actual construction of the executable elements of the Solution are created. Micro Design activities typically involve decisions around the fine grain specifications on how a business function will be implemented in software or to complete the final details around complex business logic (e.g. statistical calculations). Because the Eligibility *SmartPro MedEE* Solution is composed primarily of commercial software based on proven architectural approaches, there will be less effort in design than if it were a custom developed system or a system that is strictly a framework or collection of COTS tools. Design is typically performed in parallel with Development following the principles of Rapid Application Development.
- **Development.** The component development teams will construct or configure their components and perform a unit level test following guidelines established as part of the

overall master test plan so that a common level of quality results is achieved prior to Integration Test.

- **Integration Test.** At defined milestones within the Development as well as Implementation phase, component development teams will assemble the individual “units” of the application and confirm that the functions “within the four walls” of their component are working as specified. Integration Test verifies that the each component of the overall solution is ready to proceed to End-to-End solution testing.

During all stages of the software development lifecycle for *SmartPro MedEE*, the individual component development teams will follow their unique implementation methodologies and techniques to perform these specific activities. This illustrates our approach enables effective integration of complex systems, while having the flexibility to incorporate domain specific methodologies.

As part of any form of process that ensures retraction and immutability, the effective use of an iterative development requires disciplined planning and management. The process starts by defining the overall scope of the “iteration” or “build cycle” that includes the specific functional and technical requirements to be addressed. From this, granular work items (“tasks”) required to meet the functional scope are identified and estimated. The iteration plan is completed by assigning each work item to individual team members. Throughout the iteration, progress is tracked and the iteration plan and work item assignments are refined as necessary using the tools described within the configuration management section including all components of the Rational Team Concert software suite.

ix. Describe the organizational structure that will be in place to control changes; and

Below is a high-level view of the overall organization structure:

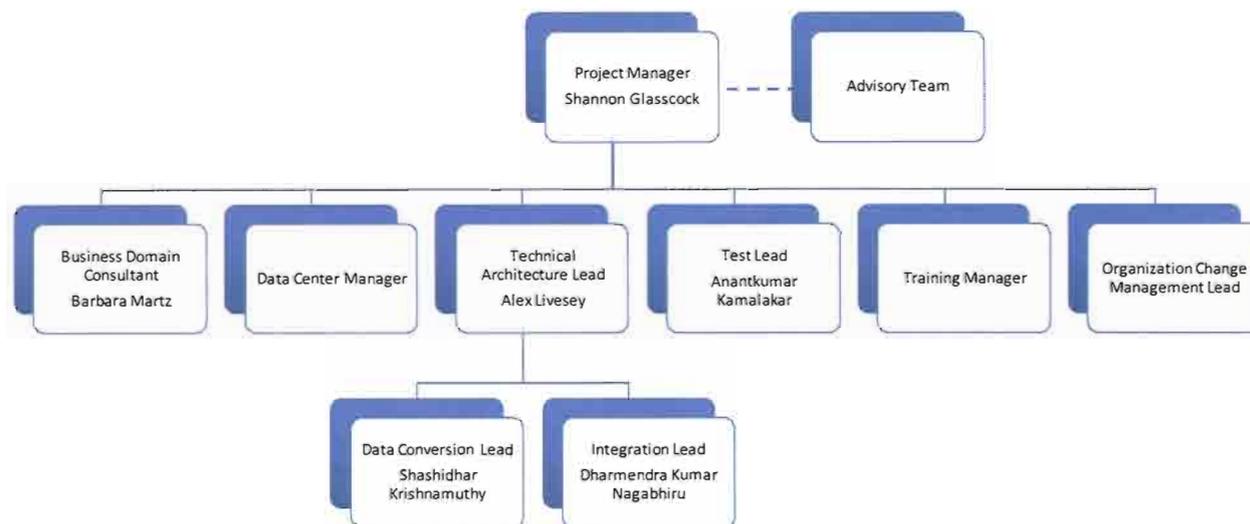

Figure IV-90: Overall Organization Structure

Each of the team leads will be responsible to control changes within their area. The project manager will report on major changes, and will flag changes that impact delivery schedules. It will be the responsibility of the change control board to approve or reject these changes.

- x. Describe how the Contractor will inform the State of Nebraska of the benefits that would realize from any and all announcements of a new version of hardware, software, or COTS product.

The Wipro/IBM team, as part of regular status reports provided to the MLTC, will include any information and product suggestions, including enhancements, to the product baseline being recommended as part of this request for proposal. For *SmartPro MedEE*, major (“X”) releases occur every two to three years. Major (“dot x”) releases occur semi-annually to annually. There are also patches and fixes as well as emergency patches that are made available to the project. The release notes of a new product release will be analyzed to determine its impact on the project. Addition of patches is included in the current project plan, as these typically do not provide new functionality. .x releases which may include new functionality will be analyzed for their impact and a decision to either implement or wait on the implementation will be made after review with MLTC project leadership. With the current rules and regulations and federal guidance continuing to evolve related to the Affordable Care Act, release schedules over the past year have been accelerated and this is expected to continue throughout the first half of 2014. Sometimes, *SmartPro MedEE* also makes pre-release information available to the project teams based on specific agreements and relevance to the State project.

7. Project Performance Management

- i. Describe the performance metrics that will be established for the project;

The project manager will update the project work plan provided with our response at the task and resource level for the execution of the project. This becomes the tracking and status reporting mechanism to guide the project team’s activities and provides the baseline to develop status reports and measure progress.

Every week, the Wipro/IBM team reviews cost and schedule performance for the previous week, the status of planned accomplishments, plans for the current week, project calendar of upcoming events, risk mitigation, and draft baseline changes that potentially impact project requirements, cost, and/or schedule. This approach, described in Figure IV-91, enables us to address minor variances before they impact the overall project.

Previous Week (Status Week)	Current Week (Report Week)	Next Week (Future Week)
<ul style="list-style-type: none"> ▪ Pull Data from Schedule ▪ Valid Deliverables ▪ Capture/Update Issues 	<ul style="list-style-type: none"> ▪ Collate and Deliver Reports (PMO) ▪ "Stand Up" Status Brief 	<ul style="list-style-type: none"> ▪ If necessary, adjust plan to accommodate future tasks

Figure IV-91: Weekly Status Reporting

A sample weekly status report is provided as Figure IV-92 “Sample Weekly Status Report” below.

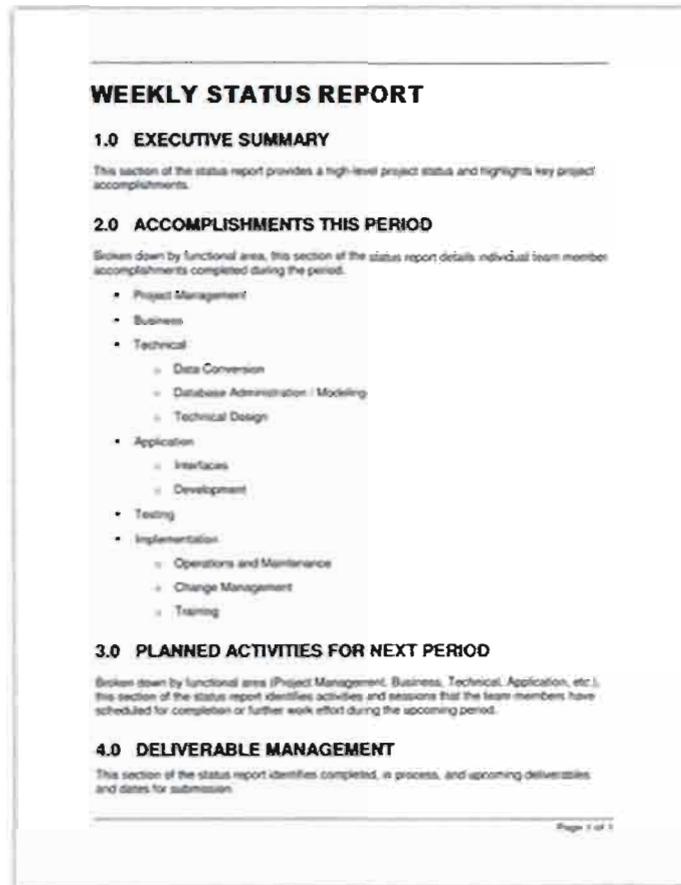

Figure IV-92: Sample Weekly Status Report

In addition to the weekly status reports, our team will provide Nebraska with monthly and quarterly status reports described in the table below.

Table IV-23: Additional Status Reports

Status Report Type	Report Details and Benefits
Monthly Status Report	<ul style="list-style-type: none"> • Summarizes the weekly status reports • Provides measurements for project performance such as deliveries, quality of deliverables, client and project team commitment, schedule performance index, and budget performance • Includes important information from project tracking systems such as the Risk Management Log, Issue Log, Configuration Management Log, and Project Change Request Log • Compiles and lists the milestones and major tasks that are accomplished, not met on schedule, and outstanding • Includes earned value management metrics to measure our monthly project performance and progress
Quarterly Status Report	<ul style="list-style-type: none"> • Summarizes the state of the project and the issues, risks, and performance metrics updates for the past quarter and expectations for the upcoming quarter

Status Report Type	Report Details and Benefits
	<ul style="list-style-type: none"> Provides the Nebraska executive sponsors and vendor executives with an accurate project status to provide appropriate decision support for addressing risks and issues or performance metrics

At project initiation, we will fine-tune the standard project status report, including performance metrics, from our methodology to align with Nebraska’s standards. The status report will be distributed according to the Communication Plan and available online through SharePoint.

ii. Describe the EES Dashboard that will be developed based upon the Contractor’s previous experience

Below is an example of a dashboard that has been used on one of our previous projects. We will work with Nebraska to build a dashboard that is appropriate for the *SmartPro MedEE* project.

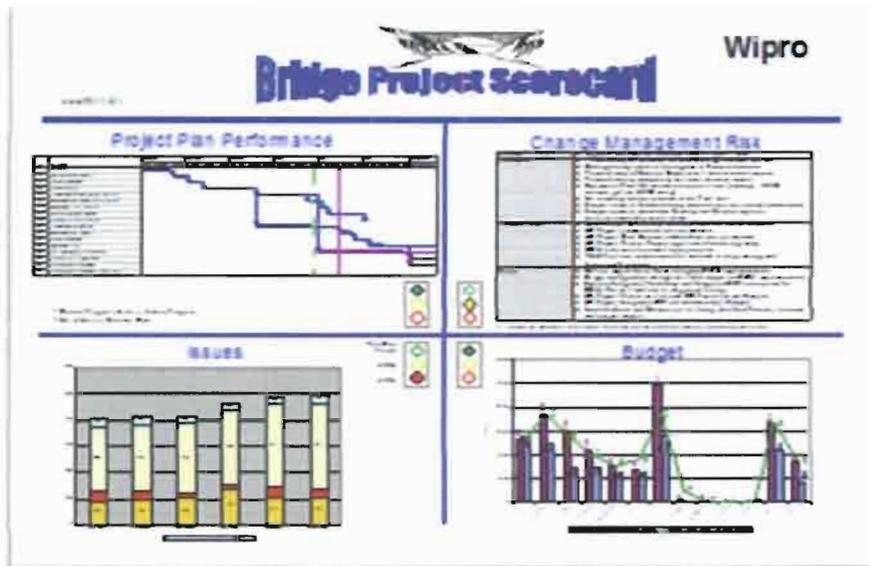

Figure IV-93: Sample Dashboard

iii. Describe any tools that will be used to track its Project Performance

We employ a variety of project management tools, as summarized in the accompanying figure, which support our efforts to track project progress and achieve published milestones. The following sections provide greater detail regarding how these tools are used to develop project assessment reports throughout the life of the *SmartPro MedEE* project.

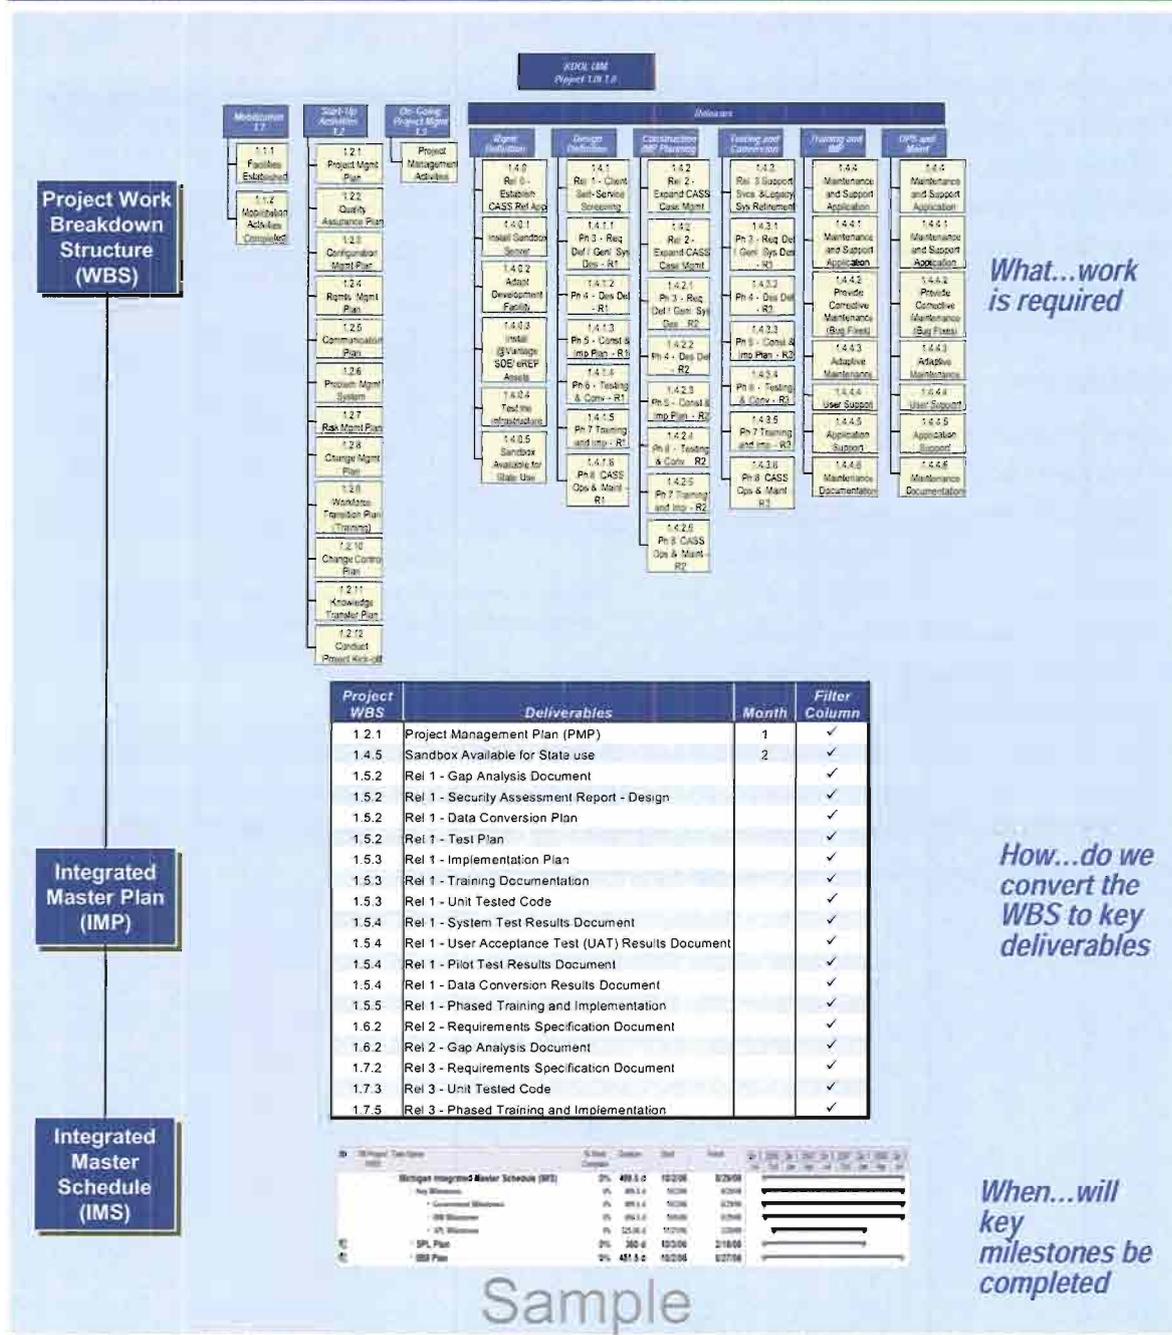

Project Tools in Action

The WBS shown in Figure IV-n encompasses activities and products for the phases of the *SmartPro MedEE* implementation project. The WBS provides the starting point for the Detailed Project Schedule (DPS). The DPS features the detailed activities required to implement the work outlined in the project WBS. This detail includes dependencies between tasks, a consolidated generic resource pool, the assignment of resources to tasks, and the identification of which branch of the project WBS a given task supports. This information helps us to manage project schedule and cost performance, deliverables and staffing. Once the contract has been initiated, the generic resources assigned to tasks are replaced by our project key personnel and other non-key personnel, which help enforce accountability for individual tasks.

Tool	Function
Microsoft Project	Maintain Integrated Project Plan and Schedule
Microsoft Excel	Reporting project performance
Microsoft SharePoint	Web-based team room that provides a repository to store, access and version control project documents
IBM Rational Team Concert	Tool to manage and provide visibility for: <ul style="list-style-type: none"> • Issue management • Risk management • Defect tracking • Change requests

Figure IV-94: PM Tools

We use our project management tools individually or in integrated configurations to support a wide range of project management functions.

UIM-099

Figure IV-95: IMP/IMS Planning Approach

The IMP/IMS planning approach provides consistent data for work scope, timing, staffing levels, and resource assignments and supports consistent progress measurement.

We use Microsoft Project to create an integrated master project schedule. The Integrated DPS provides visibility for the handoffs between organizations and enables progress to be assessed against project milestones. The detailed schedules are used to track day-to-day activities for the Wipro/IBM team, including traceability to individual teams and personnel.

A consolidated list of key contract deliverables is contained within the Integrated Master Plan (IMP). The IMP is a top-down, event-based plan consisting of a hierarchy of program events. Each event is supported by specific accomplishments, and each accomplishment associated with specific criteria to be satisfied for its completion, typically issuance of a deliverable. The IMP represents a key mechanism for project progress visibility and control. Each of the key deliverables in the IMP is associated with a respective project WBS branch. This approach helps to maintain a reasonable association between payments and the level of effort expended to produce the deliverable.

- Issues and risks status
- Staffing by tasks and Level of Estimate (LOE)
- Issues and risks status

iv. Describe how the Performance Management Plan will be implemented into the overall PM approach including any and all tools that are used;

The Performance Management Plan will include:

- Performance Report Templates
- Frequency of reports
- Intended audience of each report

It will be integrated into the Program Management Plan.

iv. Describe the Contractor's organizational structure that will be used to track performance

Below is a high-level view of the overall organization structure.

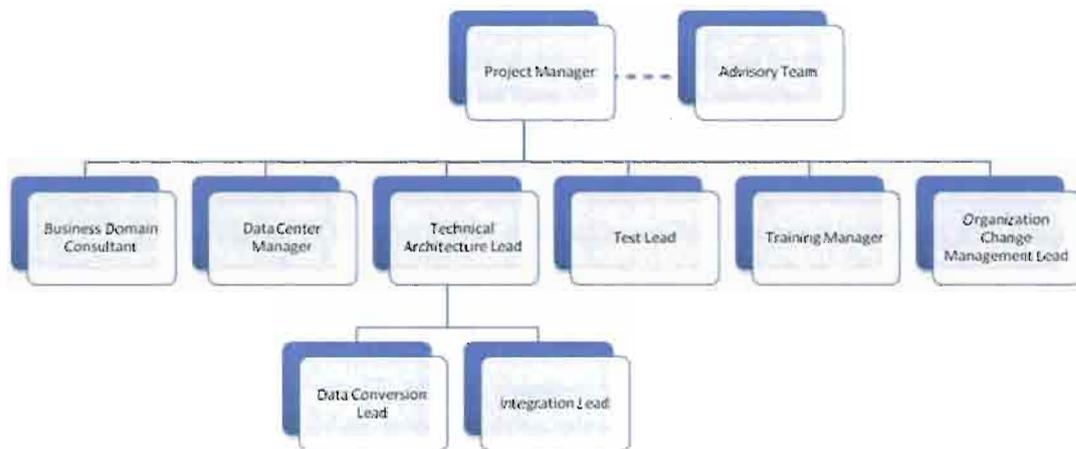

Figure IV-96: High-level View of Overall Organization Structure

The project manager will be responsible for producing the status reports and performance metrics, with input from the 6 team leads: Architecture, Conversion, Integration, Test, Training, and OCM. Ultimately, though, it is the responsibility of each team member to provide status, and to escalate issues as they occur.

8. Communications Management

i. Describe how communication with the different stakeholders will be accomplished;

For the *SmartPro MedEE* project, potential stakeholders will include: Medicaid department State workers, caseworkers, MLTC citizens who are eligible for Medicaid benefits or tax credits under the Affordable Care Act, MLTC citizens who are potentially eligible, community members including citizen advocates, navigators, providers, insurers, and other related departments.

We will create a stakeholder map specific to MLTC which will drive the communication plan to determine the frequency and method of communication. Key stakeholders will be involved early and communication will be more frequent – especially at the start of the project. For some of the State groups that are not directly impacted by the project, communication will be less frequent. For core project team members, communication can occur daily or more often depending on the project schedule.

The key to a successful project and a foundation for organizational change management is the communication plan. The communication plan will allow varying formats for communication. For example, in New York City, potential recipients of benefits were kept aware of AccessNYC by advertisements in subway stations. In most instances, the communication plan will include multiple formats as individuals receive information and learn differently. Some items may be communicated via social media where appropriate and where security is not an issue. Some may use printed communication and newsletters. Some will be in electronic email format. There will also be group or town meetings to keep the constituents aware of the progress of the system and its impact on them.

ii. Describe the different communication channels that will be used;

Communication channels used will depend on content of communication, urgency, whether feedback is requested, preferred method of communication, and MLTC approved channels.

The key to a successful project and a foundation for organizational change management is the communication plan. The communication plan will allow varying formats for communication. For example, in New York City, potential recipients of benefits were kept aware of AccessNYC by advertisements in subway stations. In most instances, the communication plan will include multiple formats as individuals receive information and learn differently. Some items may be communicated via social media where appropriate and where security is not an issue. Some may use printed communication and newsletters. Some will be in electronic email format. There will also be group or town meetings to keep the constituents aware of the progress of the system and its impact on them.

Communication channels may include the following:

- Regularly scheduled project meetings
- SharePoint
- Email update
- Group or town meetings
- Newsletters
- Social media where appropriate'
- Public media such as newspapers, blogs and public forums

- iii. Describe how the Communication Management Plan will be implemented into the overall PM approach including any and all tools that are used; and

The Communication Management Plan will include:

- Stakeholder identification and analysis
- Communications matrix which will include frequency, style, and stakeholder
- Project meeting and project reporting schedule

A log of the stakeholders, communications mechanisms and copies of all communications, categorized by stakeholder, will be maintained. This will include all email announcements, newsletters, electronic communications, press releases, and other forms of communications.

- iv. Describe the Contact Management System that will be used to track and report written, electronic and telephone inquiries from users and other stakeholders; and how it will be integrated with other EES functions and accessed by Department staff.

The Wipro/IBM team will leverage Wipro's InfoPACC service management and call tracking application to support the Contact Management requirements detailed by MLTC. The application supports the communication channels required by MLTC such as Phone, Email, and Web. Department staff (including users and other stakeholders) can submit inquiries to the application which will then flow to the appropriate tier for resolution. InfoPACC is configurable in order to meet the specific needs of Nebraska. For example, it can be configured based on user categories, as well as call categories, and has built-in workflow to route information to the appropriate tier. It is a web-based application that is accessible to Department staff and will be part of the *SmartPro MedEE* operating environment.

The below graphic illustrates a sample escalation process:

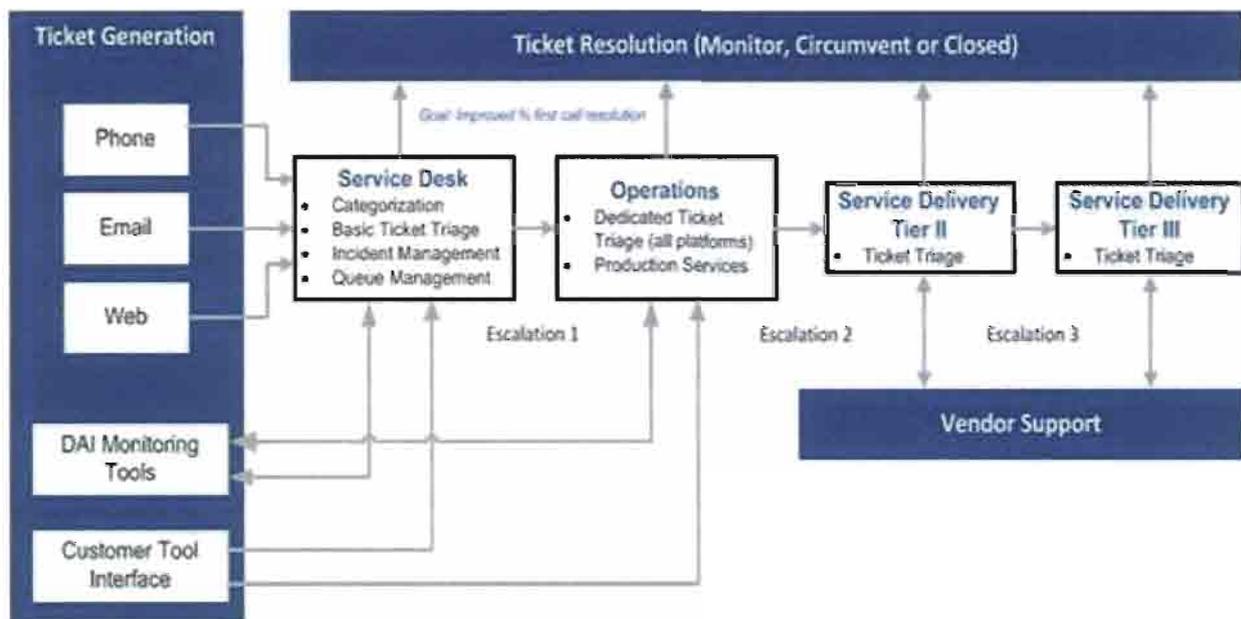

Figure IV-97: Sample Escalation Process

9. System Development Life Cycle (SDLC)

- i. Describe the SDLC the Bidder will use in the requirements analysis, design, development, testing, implementation, and maintenance of the EES.

The Wipro/IBM team will use the *SmartPro MedEE* Methodology to plan and manage all activities of the *SmartPro MedEE* project based on specifications of Nebraska. Our methodology was developed based on successful project implementations – merging best practices from Wipro and IBM - and aligning with the CMS Enterprise Lifecycle (ELC). Figure IV-98 provides a graphical representation of the activities included in our methodology.

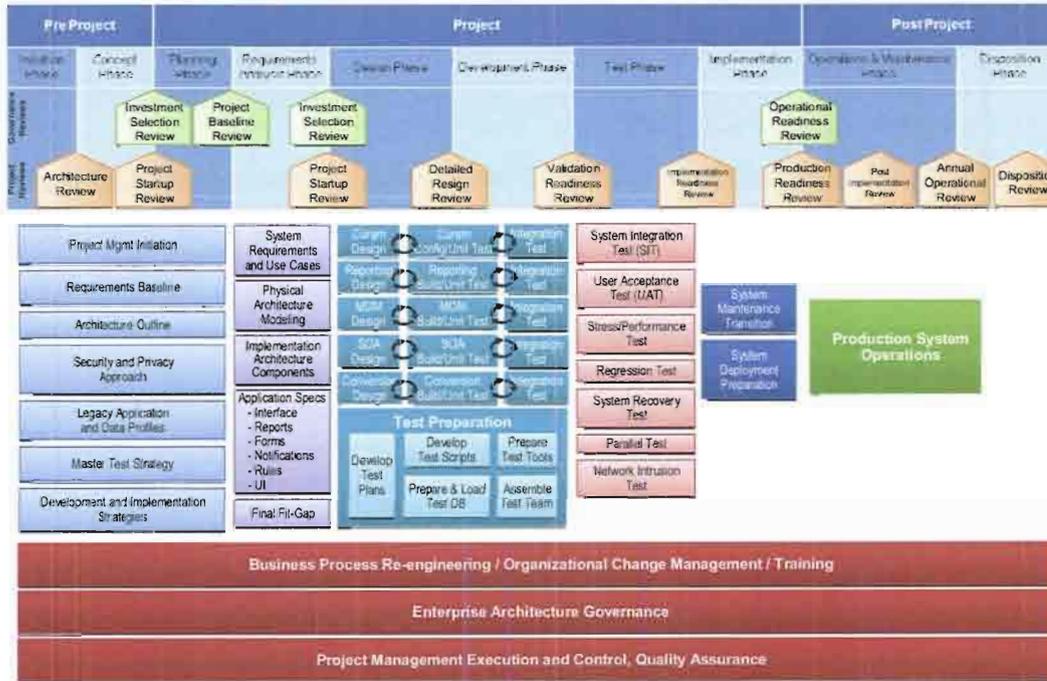

Figure IV-98: CMS Enterprise Lifecycle (ELC)

Requirements Analysis

During the Initiation, Concept, and Planning phase, we will create a requirements baseline. For this activity, we will develop a catalog of clearly defined business requirements and use cases and their relationships to one another (use case model). We will also capture relative priorities of requirements and use cases and identify those functions that are potentially challenging to achieve. An important input to this phase are pre-built versions of the requirements catalog, process models, and use case models from the collective Wipro/IBM asset library. These assets will be reviewed and refined by our domain experts on the Wipro/IBM team and tailored for use in the requirements baseline sessions. Through conferences, meetings, and work sessions, The Wipro/IBM team will use an iterative process to evolve the initial drafts of the requirements model. The outcome of the sessions is a clear understanding of application development effort and the acceptance criteria for satisfying each requirement.

During the Requirements Analysis Phase, we will elaborate the general business requirements and high-level use cases to a system level of granularity. The system requirements contain enough

information so that test cases can be developed to verify functionality and accuracy and in addition, process models, business rules, and other support requirements artifacts are evolved to a more granular level.

Design

Design takes a holistic view of the end-to-end solution. Design begins during the Requirements Analysis Phase, where we create design specifications for solution components (subsystems) and evolve the architectural model to a physical level. As the system requirements and use cases are elaborated, the various application component design teams will create specifications for each component. Using the system specifications and refined requirements from the JAD sessions, the system architecture team, under the guidance of the Design Authority, completes the definitions of the five layers of technical architecture: Application, Integration, Data, Security, and Infrastructure. An important technique used during Physical Architecture Modeling is Technical Feasibility Exploration (TFE), which uses actual working prototypes to validate that the proposed designs are deployable and interoperable.

During the Design phase, the application technical designers take the functional specifications from the Joint Application Design process and the Architectural Standards and Design Patterns to develop “Micro” level designs. Each of the specialized technical component teams will use specialized design techniques and tools best suited to their particular product to perform Micro Design. A critical element of our methodology is a highly interactive working environment with the State representatives from (1) the business community to validate the functional approach and (2) from the technical community to validate that the technical approach adheres to the required State specified standard. Technical Design Quality will be managed by (1) conducting walkthroughs with senior team members, (2) performing functional validation sessions with business analysts and users, and (3) maximizing out-of-the-box functionality over custom developed functions. At the completion of functionality within a phase, a final review will be conducted to validate that the Technical Design Document Deliverable contains artifacts as specified by the Deliverable Expectation Document and that they designs follow the overall architectural standards set for the solution.

Development

Unlike traditional waterfall methodology, Micro Design is generally performed in rapid succession with Build and Unit Testing at the component and sub-component levels. The goals of this stage are 1) to configure and/or construct the major solution components according to the Macro Design specifications and 2) to confirm that the components meet the quality standards required to proceed to the integrated testing of the end-to-end solution.

During build and unit test, the component development teams will construct (or configure) their components, leveraging application-specific development techniques and tool sets. Each developer will validate his or her work according to guidelines in the Unit Test plan in order to achieve a predictable level of quality prior to Integration Test. This illustrates how our methodology has the flexibility to incorporate domain specific methodologies, while having effective integration of complex systems under a common framework.

During integration test, the component development teams will assemble the individual units within the “four walls” of their application to validate that they are working together correctly. Our methodology follows the practice of continuous integration. Integration testing is NOT a single event, but a series of incremental steps that are repeated until the required functionality is complete. For example, the Analytics team may conduct multiple tests of an ETL stream from source system to the repository layer and later to the semantic and the presentation layers.

Testing

The Wipro/IBM team proposes a structured, iterative approach to fulfill Nebraska’s testing requirements. This program will follow our Full Lifecycle Testing methodology, which incorporates levels of testing, from Unit Testing through System Regression Testing. The full lifecycle testing methodology has been incorporated into the *SmartPro MedEE* Methodology.

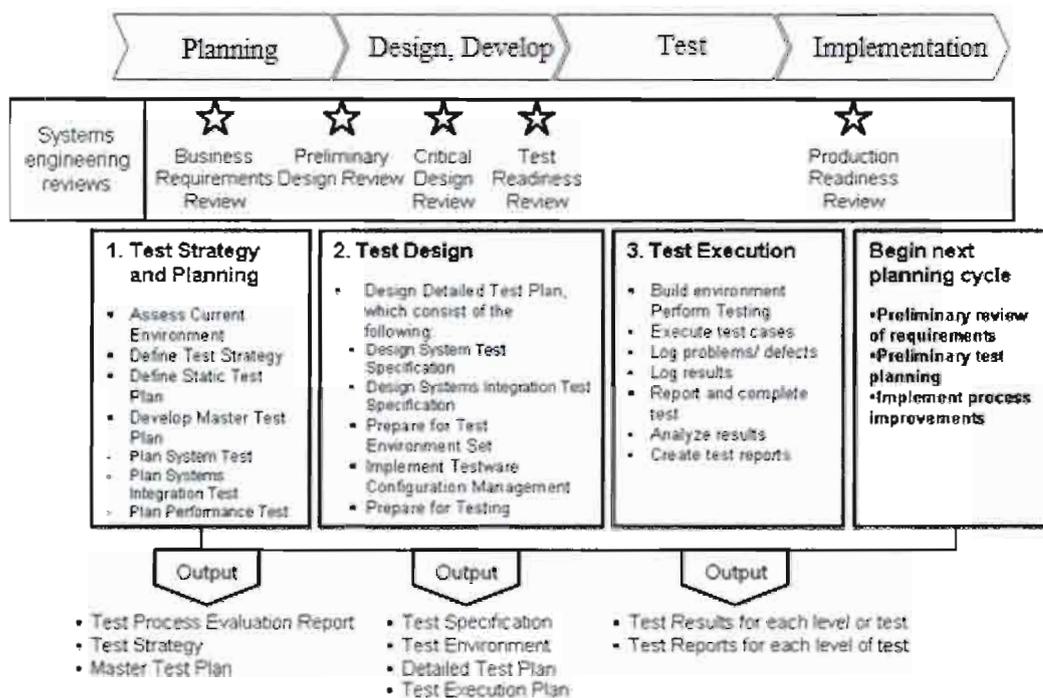

Figure IV-99: *SmartPro MedEE* Methodology

Our Full Lifecycle Testing, as seen above, describes concrete actions known as End-to-End (E2E) testing that will occur continually throughout the *SmartPro MedEE* project. During the planning phase, the Wipro/IBM team will process the outputs from the following activities as inputs into the Master Testing Strategy:

- Business / functional Subject Matter Experts (SME) reviews to confirm our understanding of business requirements
- Technical / non-functional SME reviews to confirm the in-scope technical requirements
 - The Wipro/IBM team will also use these SME meetings to review our proposed conceptual architectural solution, and quantify the component modules and system interfaces as either high or low risk with specific regard to testing;

- External system owner and Nebraska IT reviews to confirm our understanding of their As-Is systems, applications, and business processes to be integrated through the *SmartPro MedEE*.

The transition from Master Testing Strategy to discrete, detailed test plans will begin during the Planning phase and finish through test preparation in the Design/Develop phases. Inputs into these test plans will come from a variety of sources, including:

- JAD sessions, which will begin with Nebraska's functional and non-functional requirements to produce detailed use cases, technical specifications, report layouts, screen designs, and data requirements for system interfaces.
- Results from Unit and Integration Testing, which will produce the first set of Nebraska-specific test cases and test scripts to be combined and later reused during test execution.

Our Full Lifecycle Testing is end-to-end in two distinct ways:

- Through concrete iterations, checkpoints, review sessions, and key inputs from other components of the *SmartPro MedEE* Methodology, the Wipro/IBM team will gradually build a complete test system architecture from a Master Testing Strategy to individual actionable test plans to a complete library of Nebraska test suites, test cases, and test scripts.
- Use of outputs from JAD sessions, the final Fit Gap, and the results of Unit and Integration testing to structure the developed test suites, test cases, and test scripts in a way that maps to complete, end-to-end business processes.

E2E testing is the first opportunity to view and validate the complete *SmartPro MedEE* solution. E2E testing is both inter- and cross-modular, and it aims to verify the Nebraska's ultimate To-Be vision of a complete solution that synthesizes information from numerous legacy business systems, setting a national standard for an Eligibility and Enrollment solution.

- ii. Describe the contents of all documents and artifacts deliverables produced within the SDLC including but not limited to:

Business Design Document

The Business Design document will describe the overall Functional Architecture of the business solution including high-level process flows for key areas of the solution. The document will also include the Assumptions, Constraints, and Risks associated with the proposed solution approach.

Requirements Document (Business, Functional, Non-functional, Requirements Traceability Matrix, etc.)

The Requirements Document will be split into two, namely, 'Functional' and 'Non Functional' requirements. The original requirements will be elaborated on the following principles,

- Correct: The requirement reflects the actual needs of the organization
- Unambiguous: The requirement has only one interpretation
- Complete: The requirement detail is sufficient and stands on its own
- Consistent: The requirement does not conflict with itself, or with other requirements
- Verifiable: The requirement must be testable
- Traceable: The requirement must be uniquely identified and its origin/source recorded

The Traceability matrix will map the requirement to the appropriate functional design and the potential development branch.

Business Process Models

Upon receipt of client requirements, it is necessary to assess the extent to which they will be supported by the *SmartPro MedEE* solution. This often represents the start of fit-gap analysis. Each requirement will have a fit-gap done to determine if it is met Out-of-the-Box (OOTB) or if it will require customization. The Fit-Gap document will be based on the following:

- OOTB – Existing solution functions can be used with no change or configuration required
- Configuration – Standard solution configuration can be used to meet the requirement
- Customization – Standard solution functions meet most of the need, with the added specificity of the requirement driving slight tailoring using one or more of the *SmartPro MedEE* development tools
- Extension – Standard functions meet less of the need than customization, requiring extensions using common framework development practices and without making amendments to the core solution itself.

SmartPro MedEE has processes defined Out of the Box (OOTB). This document would include the process models that are either modified or newly identified. The process could be screen flows, workflows, and new batch processes.

Use Cases or User Stories

As the Functional Design document includes the design for changes and updates to the OOTB functionality, it will serve as the Use case document also.

Detailed Design Document

The Approach to Functional design will be to design for all requirements that are not classified as OOTB. The requirements are typically broken down by functional area to limit the scope of each design. For example: Client Management, Case Management, Provider Management, etc.

The Functional design document will include the Requirements that are addressed, the screen flow pertaining to the new or modified functionality, processes, tasks generated, and any notice triggers.

Technical Design Document

Each Functional design will have one or more Technical designs associated with it. The Technical design document will address Configurations, Server layer, and Web Layer design. It will also include a section for Unit testing.

Architecture, Network and Data Modeling Diagrams

Data model changes for only updates and new entities will be captured in the Logical and Physical data model documents. The Logical data model will include the description of the modified and/or new entities and the relevant relationships. The task of developing a physical data model begins with an approved Logical Data Model created during the Requirements Phase of the EPLC process. The

logical data model is transformed into a physical data model using several techniques including: Denormalization, Indexing, Partitioning, Views, and Dimensionality.

The Application Blueprint will provide the overview of the different solutions and their interaction that are in play for the Nebraska Eligibility and Enrollment solution.

Test Plans

The Test plan document will describe in detail the approach to testing. It will include the Testing Schedule, Test Cases, Acceptance Criteria, Test Environments and Testing phases. The document will also define the approach to Testing for each functional area including interface, integration, and performance testing. The approach to UAT testing, Smoke testing and Regression testing will also be included in this document.

Disaster Recovery

The Disaster Recovery Plan will document the process and procedures to recover and protect Nebraska's IT infrastructure in the event of a disaster. The plan will include a Network DR plan, Business Impact Analysis, Business Continuity, and an Emergency Management plan.

Training Plan; Knowledge Transfer Plan

The Training plan will outline the different training methods that will be used to train the staff that will be using the new system. This will include modules for Web based Training and classroom training. The document will also have a section on how each 'office' will be ready for a potential go-live.

The Knowledge Transfer plan will include details of operational processes, data plan, and configuration. It will also include a time line for meetings across different functional, technical, and operational areas.

Canned and Newly Developed ESS Reports

The Reports document will list each report, the business description, the frequency of use, the type of data that will be returned and the functional area that it belongs to. This will be a comprehensive list of all reports as agreed to by the stakeholders.

Project Definition

The project definition encompasses various management control procedures used on the project. It will include new hire orientation, project organization chart, including roles and responsibilities, and operational descriptions related to storing artifacts and deliverables and also logging and working on defects.

- iii. Include a sample of the documents and artifacts described above that the Contractor has produced for a previous EES engagement or engagement of similar size and scope.

Please refer to the attached sample documents and artifacts completed for previous *SmartPro MedEE* engagements of similar size and scope.

- iv. Describe the proposed estimation methodology.

The Wipro/IBM team will utilize a bottom-up estimation method. This approach begins with high-level project definition, and then decomposes the work into sub-projects and lower level tasks down to the Work Breakdown Structure. Team member experts will be consulted to provide domain knowledge in estimating at this level. The advantage of this technique is that the estimate is usually more accurate and the work is better understood.

v. Describe the organizational structure to control all system development and maintenance.

Below is a high-level view of the overall organization structure:

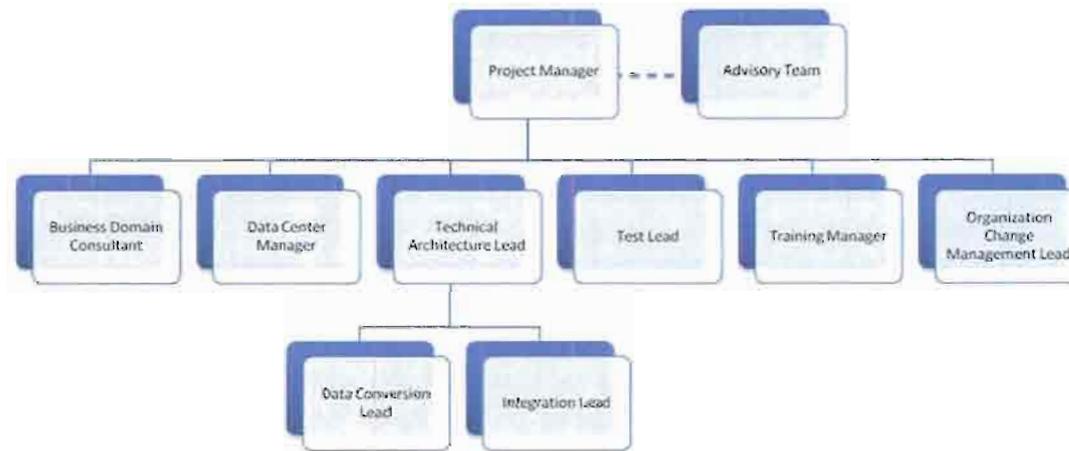

Figure IV-100: Overall Organization Structure

System development will be managed the Data Conversion Lead and the Integration Lead, with guidance from the Technical Architecture Lead. These leads will manage the day-to-day activities of all developers, will track the schedule, and will help to remove barriers for the team.

Maintenance will be managed by the Data Center Manager, who will be responsible for monitoring the environments, and for upgrading environments. He will coordinate changes with MLTC IT staff when appropriate.

The project manager will be the point of escalation for all team leads, and will work with the steering committee for topics that are out of his control. The project manager will be responsible for performance collection, tracking, analysis, and reporting.

vi. Describe how the SDLC will be implemented and how it will be integrated into the overall Project Management approach, including but not limited to, Quality Management, Change Management, Data Governance.

The *SmartPro MedEE* methodology has three work streams that span and support the entire SDLC.

- **Project Management Execution and Control, Quality Assurance:** will be responsible for managing scope, risks and issues, status reporting, and overall project health. Quality checkpoints will occur throughout the project, including gated reviews.
- **Business Process Re-engineering/Change Management/Training:** will be responsible for steering the project towards best practices in business processes, and for helping the users adapt to the new system.

- **Enterprise Architecture Governance:** will provide guidance to developers on development standards and data governance, and will guide the overall solution.

vii. Describe the levels of management authority that will be used to ensure timely direction, coordination, control, review, and approval of the SDLC process.

For the most part, the teams will be self-governing, able to make day-to-day decisions. Team leads will be responsible for cross-team communication, decisions, and issue-resolution, and will involve the appropriate resource from other teams when outside expertise is required.

In addition, there will be a joint executive steering established with the State to include Wipro and IBM senior executives, as well as key partners (such as software providers) to quickly resolve issues beyond the teams' control and to guide project direction.

We believe that the “culture that values cooperation, teamwork, and planning” is critical to project success. This is truly a multi-organizational effort with no one organization having the self-contained resources to achieve project success alone.

viii. Describe the process that will be used for developing and updating Business Process Models for the EES.

We will leverage best of class process models enabled by the package as a starting point, and will conduct working sessions so that all team members are aware of the package capabilities. In addition formal interviews will be conducted to obtain information from the stakeholders and subject matter experts. Once all interviews are completed, an enterprise business model is compiled. Business analysts will create the “As-Is” and “To-Be” models. Comparison of both models will reveal process gaps that may require minor modifications or process reengineering. The results are presented to the stakeholders and subject matter experts for subsequent review and approval.

ix. Describe the data modeling tool that will be used to model the conceptual, logical, and physical EES data structures. Include how the models will be managed and versioned from a single tool and central control point. Discuss the solution in terms of its degree of integration, flexibility, scalability, extensibility, supportability/maintainability, and affinity/relationship with other proposed components.

The primary control point for the *SmartPro MedEE* conceptual and logical data model is Rational Software Architect (RSA), which contains all models delivered Out-of-the-Box. Rational Software Architect is integrated, via Rational Team Concert, with Rational Requirements Composer and Rational Quality Manager so that traceability can be maintained end-to-end.

Changes to the Out-of-the-Box model are managed via *SmartPro MedEE* configuration rules such that extensions are kept separate and can be re-applied when new versions of the Out-of-the-Box product are installed, to provide for easy support and maintenance. It is highly flexible as the model-driven *SmartPro MedEE* integrated development environment automatically generates many of the supporting Java classes required when new elements are added to user interface and database to support the transport of the information through the application layers.

The physical data model is then constructed by exporting from RSA into ERStudio Data Architect which is used to generate the final data structure generation scripts.

x. Describe the degree to which the physical model that is created from the tool can be used without augmenting physical characteristics after the data structure generation scripts are created.

The physical model is created directly from ERStudio Data Architect without further augmenting the physical characteristics.

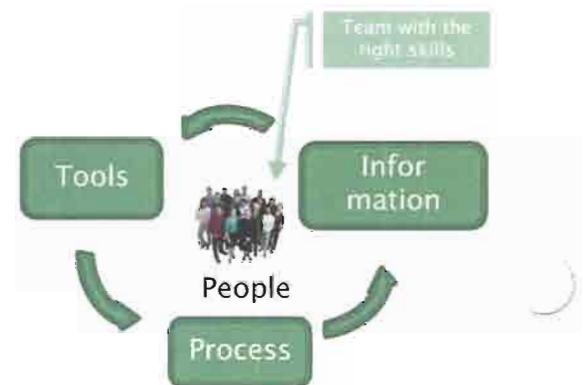

10. Project Initiation

- i. Describe the Project Initiation activities that detail the approach for orienting the Project team (Department, IV&V Contractor, and other stakeholders).

A project of this magnitude involves assembling a significant organization and preparing them to execute a large number of detailed steps leading to a common goal. It needs the full power of an organizational change method to perform this smoothly.

Organizational change for the project

- Move from a collection of individuals to a collaborative team with the skills, data and tools they will use for the next few years
- Provide Communication Plan to ensure team members have the information they need and questions answered
- Other team-building practices
- Assemble and disseminate Initial Data
 - Provide the project definition – where we are going
 - Define the solution so far – starting point
 - Define the delivery process (method) – how we get there

A project has four key components and project initiation needs to focus on assembling them all according to a detailed plan that coordinates getting enough of each in place as quickly as possible without introducing unproductive confusion. The Wipro/IBM team will use a project launch process that optimizes the start-up by bringing team members on board as rapidly as possible while providing them with the information they need to become productive and the tools they need to do the job.

The Wipro/IBM approach to Project Initiation includes the following tasks to establish the project

- Establish Initial Technical Environment
- Launch project, understand scope, risk, build startup plan
- Establish project management system
- Review and revise project performance indicators
- Expand work plans
- Refine work plans and schedules to an operational level
 - Update other project plans
 - Initiate financial plan to monitor costs against budget
 - Validate technical solution
- Integrate plans and review project
 - Integrate plans, ensure consistency and completeness

- Conduct management review
- Start staff, establish people objectives, engagement rules
 - Develop orientation material and team charter
 - Plan, verify and allocate office space and material
 - Orient staff and conduct kick-off
 - Plan *SmartPro MedEE* training for client staff
- Conduct Method Adoption Workshop

It is important for a project of this magnitude begin on the right track. A fast but organized start is essential to give people the information and the tools they need to become productive as quickly as possible and to provide a collaborative environment so that all work is making progress towards the desired goals with neither omission nor duplication of essential work.

It is important that all team members are aligned, working towards the same objectives and client vision, familiar with the COTS packages being implemented, following the same methodologies and standards, aware of the overall timeline and milestones, in agreement of roles and responsibilities, and aware of interdependencies. We believe that it is important that the entire project team (Department, IV&V Contractor, and other stakeholders) are in sync at the project outset to remove ambiguities and to help deliver a successful project.

Orientation of the team will include providing knowledge of the end goals of the project and the approach to reaching the goals.

Orientation towards the end goal will include project kick-off material that outlines the requirements and the proposed solution. An overview will be provided to all team members, while more detailed education on the core COTS solution components will be provided to those stakeholders who will require more detailed knowledge. The education will be tailored by stakeholder role. As the State indicated in the RFP, "The Department will modify its current business processes and retrain its staff to adopt the business processes built into the *SmartPro MedEE*" so by providing education on the new business processes in the Out-of-the-Box solution, MLTC staff will be better positioned to participate in the early requirements confirmation workshops because they will have sufficient context.

The other aspect of orientation is to hold a series of Method Adoption Workshops (MAW). The primary goal of these workshops is to communicate an understanding of the methodology for the project and to further adapt it to the needs of the project by making any adjustments needed to align Wipro/IBM methods with MLTC methods.

The MAW will focus on those aspects of method with inter-team dependencies; each team will have detailed knowledge of their own tasks, deliverables, tools, and roles but with any large project it is necessary to confirm the expectations of each team on deliverables and dependencies that they have on other teams and that other teams have on them. The MAW will also confirm that the team members understand the collaborative tools being introduced as not every team member will have worked with the specific tools at this point. The MAW also reviews and adjusts the project schedule and identifies additional risks that emerge through the workshop.

More detailed MAWs will be conducted for those teams which include both Wipro/IBM members and MLTC members, such as participants in requirements confirmation workshops.

ii. Describe the activities that will be necessary to secure and to prepare adequate facility space.

Our team will be responsible for securing adequate facility space for all team members. During project initiation, the Project Manager will create a plan to initiate facility space based on several factors, including number of anticipated resources, meeting room requirements, and team breakout areas, as well as other special requirements (for example, raised floor room for computer equipment).

iii. Describe the steps necessary to assemble other key staff, including specific plans for disseminating individual staff responsibilities.

Our team will establish/confirm roles and responsibilities through the Method Adoption Workshop (MAW), which will include Department, IV&V, and other stakeholders. We will create a RACI (Responsible, Accountable, Consulted, Informed) matrix to facilitate this discussion.

The Matrix will specify RACI by task and by deliverable for each task and deliverable in the project method. During project initiation, this will be done at a high level and at a detailed level for the first phase. The MAW will be repeated for subsequent phases to disseminate the details for the phase. By deferring the details, we can launch the project more quickly and avoid the risk of staff forgetting details over the course of the intervening phase.

The Method contains detailed descriptions of the tasks and deliverables for which the staff are Responsible, Accountable, Consulted, and Informed.

Many of these key staff are subject matter experts who will bring their own experiences and knowledge, so the MAW is also a time during which the method will be refined based on this expert knowledge while still confirming that all dependencies are met.

Once there is buy-in from all key parties, we will incorporate this into the project kickoff meeting in order for all team members to be on the same page.

11. Requirements Validation

i. Describe the proposed approach to Requirements Validation.

Wipro/IBM utilizes a methodology called the Stakeholder Collaboration Strategy (SCS). Such a strategy is a collaboration between the various stakeholder teams to define specific needs, document those needs, implement the solution, and test the solution. Every part of the process is documented and validated using activity base tracking. The tool of choice that Wipro/IBM will use is Rational Requirements Composer.

ii. Provide a detailed description of the Requirements Validation Methodology.

The Wipro/IBM methodology to requirements management is broken down into various stages. Figure IV-101 describes the stages. A more detailed explanation is as follows:

- Identify the audience target: Who are the stakeholders and what are their contributions to the solution?
- Define the organizational needs: Requirements validation is not just about implementing, it is about documenting and creating a repeatable process. The definition of organizational needs covers the necessary administrative task necessary to accomplish the Requirements Validation process from end-to-end.
- Define the artifact: Each solution may require one or more artifacts. Subject matter experts tailoring the solution to the requirements. One or more stakeholders complete artifact development, with a single stakeholder often consolidating it using an automated tool.
- Link the capabilities: Once the artifacts are identified and created, a stakeholder must bring the assets together to create a working solution. The Wipro/IBM SPS makes this process seamless by bringing together all the stakeholders and integrating the linkages into a point solution.
- Review: Once the solution is in place, all the steps to validate, document, and ensure a repeatable process are in place will be required. The review stage is where such activities occur. In addition, future requirements elicitation and validation cross-systems may occur during this stage.

Stakeholder collaboration strategy

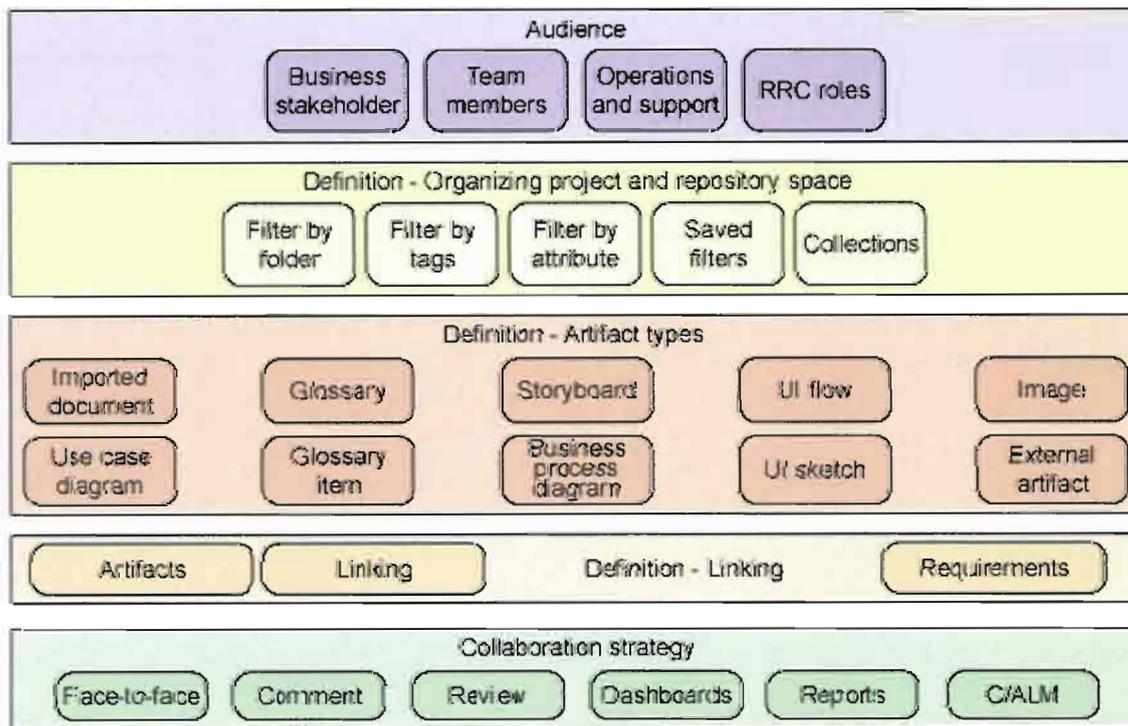

Figure IV-101: Stakeholder Collaboration Strategy

- iii. Describe the methodology and analytical tools that will be used to complete the requirement validation tasks. Provide samples of templates.

The Wipro/IBM team has a structured methodology as described in Table IV-24 on how requirements validation tasks will be completed from inception to completion. The team intends to use Rational Requirements Composer because it is a centralized requirements management platform where all stakeholders can access. Formal and informal review cycles can occur as the solution evolves. Validation and agreement can occur in a collaborative manner.

Table IV-24: Example of Wipro/IBM Stakeholder Collaboration Strategy Cycle

Technique	Purpose	When to Use	Who Reviews	Feedback Required	Target Audience
Kick-off and checkpoints (presentations about progress)	Keep stakeholders aligned with goals and involved	As required	As assigned	When appropriate	Assigned stakeholders
Informal review	Output from review sessions to gain early feedback on key business and functionality decisions	After workshops or meetings	Participants and SMEs associated with designed requirement being validated	Business, architecture, and technical suitability/accuracy	Business and technical owners owning functionality being validated
Test review	To ensure proper execution of testing techniques	As needed to validate a use case testing protocol	Testers	Testability	Developer and Tester
Formal review	Agreement from business stakeholders, level of flexibility as advised by project manager	End of iteration	Assigned parties	Appropriate level of detail as required to completely document outcomes of review cycle	Assigned stakeholders

The Wipro/IBM team has adopted the U.S. DHHS Centers for Medicare & Medicaid Services Enterprise Life Cycle (ELC) and will utilize the Enterprise Life Cycle Templates which are referenced below:

(http://www.hhs.gov/ocio/epic/Enterprise%20Performance%20Lifecycle%20Artifacts/epic_artifacts.html)

- iv. Describe how the proposed methodology and proposed tool(s) will enhance requirements validation and be supported by experienced staff

Managing requirements validation can be a cumbersome task. Finding out who owns what, what has changed, and who needs to take ownership of a specific activity during a review cycle are common areas where organizations struggle during the validation stage. Using the Wipro/IBM methodology, the ability to be proactive is achieved because people no longer have to be reactive to requests. They can understand, in real-time, where an activity is presently in the lifecycle. Getting

feedback is an iterative process; to collaborate requires a set of tools that enable dash boarding and methods of documenting requests for a variety of stakeholders. Using the Rational Composer Collaboration tools is the way the Wipro/IBM team proposes to accomplish such an objective. In Figure IV-102, you see an example of the real-time dashboard and collaboration capabilities that will be employed for the implementation of the *SmartPro MedEE* solution.

The user experience is customizable based on authenticated security roles. Access to specific artifacts will only be viewable based on assigned permissions. The same is true for dashboard metrics. This is accomplished using viewlets.

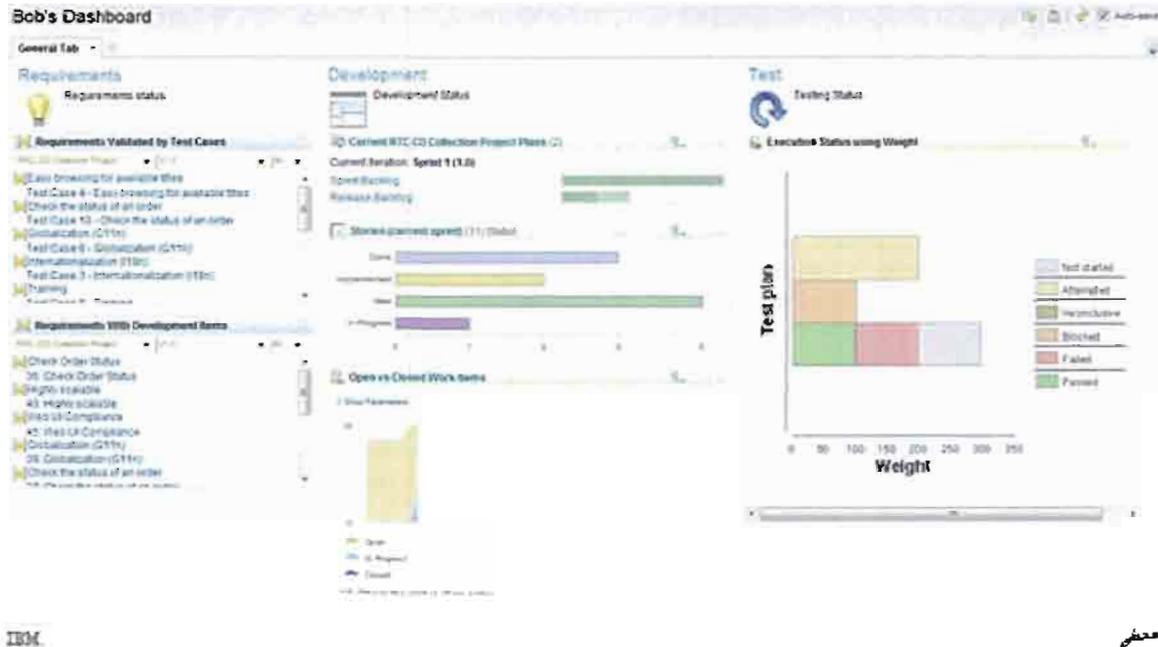

Figure IV-102: Real-Time Dashboard and Collaboration Capabilities Example

Functionality within each viewlet may include accounting of activities designated to specific stakeholders. Other activities that are part of the platform include: user driven filtering, dashboard analytics and utilization by role, and collaboration metrics.

Change Management

Change management is an integral part of the requirements validation process. The validation process is an extension to requirements management. There is still a stream of information collected during various feedback cycles. The use of Rational Requirements Composer is being recommended by the Wipro/IBM team as it allows for detailed commenting and review auditing. While change management may take place during different iterations of a project, use cases may be a byproduct of a code change, a workflow, or a high-level architecture change. Regardless of the change, it must be well documented into a centralized single system of record. A change management tool such as Rational Requirements Composer enables the synchronization of all data points. Since input into Rational Requirements Composer is iterative, feedback by multiple stakeholders can be handled synchronously.

Project plan items will be tracked in Rational Team Concert. Requirements management activities can be linked between Concert to Composer so there is a historical reference point to all requirements decisions. Contextual decision making and accountability can be against any requirement and validation process using this combination of technologies.

v. At a minimum the Bidder's proposal must:

- a) Define the goals, expectations, and output of the JAD sessions
- b) Define how the JAD sessions will be conducted
- c) Define how demonstrations of functionality will occur in the JAD sessions
- d) Define how the requirements will be identified and documented. Provide templates and samples
- e) Define how the Department's business processes will be identified and documented in the JAD sessions
- f) Define the documentation that will be provided to staff attending the JAD sessions

The Wipro/IBM team intends to use JAD sessions as a way to prototype specific areas of the enterprise application lifecycle. JAD sessions are synonymous with requirements elicitation workshops. During each session, the Wipro/IBM team will establish a structured process outlining the following to all members of the team including:

- Goal: What are we to accomplishing during this requirements elicitation session?
- Expectation: What is the proposed level of effort/cost/delivery estimate of the proposed change? When should the requirements be fully documented and transferred to the delivery team?
- Output: What requirement elicitation outputs are required to deliver the end product? What are the expectations to document changes by the MLTC?

A JAD session will be conducted during a designated period of time weekly where all stakeholders involved in the required changes will be invited to a session to share the requisite knowledge to the relevant business owners that will document and make the changes required to the system. The Wipro/IBM team suggests conducting these sessions' 2x per week. Attend *SmartPro MedEE* to these meetings would include high level management officials, developers, business analyst, and SMEs who have a relevant role to support and represent the system functionality being modified.

Depending on the complexity of the requirement being proposed, one of three techniques will be used during a requirements session. The first technique is white boarding the requirements for capture and disbursement to the relevant development team. The second technique is rapid application development. This technique is used when the change to the system is trivial and can be done in a test environment rapidly, usually during a session. Finally, an iterative approach will be used. This approach is used when the development team has completed a task and requires feedback before proceeding to the next development milestone. The changes would not be put into product; rather the business and technical stakeholders will jointly provide feedback in a constructive setting once a change has been made.

Documentation is a critical component to both the technical team and department requesting the changes to a system during a JAD session. Requirements will be classified into two key categories: functional and non-functional. Functional requirements are associated with technical requirements,

workflows, rules, and business-oriented processes. Non-functional requirements are user-experience centric requirements. The JAD session lead will prepare a PowerPoint presentation and/or paper-based agenda for each session. The JAD session agenda will be distributed 24 hours before a meeting to the invited stakeholders. In the agenda, the items to be discussed will be outlined. All stakeholders receiving an agenda should attend the meeting. During each session business owner/SMEs to a given departmental process will also be invited. For each requirement, the JAD session leader will defer to the SME to explain the objective and expected output. The JAD session business analyst/recorder will document the relevant information conveyed and disperse the knowledge presented to the team post-session. All decisions made during the JAD session will also be documented and presented in one of the Wipro/IBM team’s standard templates used during a JAD session. Depending on the complexity of the requirement, the output may be a simple change log request output to an extensive modification through the use of a software requirements specification. The Wipro/IBM team believes that a JAD session should be fluid; processes should be appropriate for the size and scope of a work change.

The Wipro/IBM team has adopted the U.S. DHHS Centers for Medicare & Medicaid Services Enterprise Life Cycle (ELC) and will utilize the Enterprise Life Cycle Templates which are referenced below:

(http://www.hhs.gov/ocio/epic/Enterprise%20Performance%20Lifecycle%20Artifacts/epic_artifacts.html)

- vi. Describe how the Bidder has planned, organized and facilitated requirements sessions in the implementation and/or transfer, design and implementation of an EES or other healthcare systems

The Wipro/IBM team intends to use the processes defined as part of the *SmartPro MedEE* methodology to plan, organize, and facilitate the requirements session. The methodology has been proven to work in other implementation similar to the Nebraska *SmartPro MedEE* and in healthcare environments. Wipro has utilized the *SmartPro MedEE* methodology to support the Medicaid program’s MMIS since 1987.

- vii. Describe how Department staff, IV&V Contractor and other stakeholders participating in JAD sessions will be oriented into the processes and trained to participate in the JAD sessions

Following the team role identification, team members will receive role-based training regarding the methodology and tools. Wipro has utilized the *SmartPro MedEE* solution methodology to support the Medicaid program’s MMIS since 1987.

Table IV-25: Team Role Identification

Team Role	Project Responsibilities	Rational Requirements Composer Role
Solution Sponsors	Responsible for steering the project delivery to meet business goals and objectives. Providing organizational support as needed by finding funds or assisting in navigating the organization.	Commenter
Subject Matter Experts	Responsible for validating and clarifying the business needs for the solution, as well as for deciding what is	Commenter

Team Role	Project Responsibilities	Rational Requirements Composer Role
	suitable for the business purpose.	
End Users	Either direct or indirect users of the system (see the first citation in Resources for more about this)	Commenter Author (optional)
Insiders	Managers of users, program or portfolio manager, developers working on other systems that integrate or interact with the one under development, maintenance professionals potentially affected by development and/or deployment of your system, auditors (see the first reference in Resources)	Commenter Author (optional)
Project Manager or Team Lead	Responsible for delivering the project. Leads and manages the project team. Needs to understand the requirements in order to scope and plan the project in conjunction with other team members. Might be aware of when to take a snapshot (for example, when artifacts have reached a level of maturity or at the end of an iteration or review cycle).	Commenter or Author Administrator (optional) Project Snapshot Administrator (optional)
Product Owner	Defines and promotes the vision, goals, and capabilities of the product so the team can make decisions. Determines the scope and content of the release. Defines acceptance criteria for the release and determines when the system is ready for release.	Author Administrator (optional) Project Snapshot Administrator (optional)
Business Analysts	Traditionally responsible for translating between business needs and delivery capabilities. Document the business problem and solution vision in a way that	Author Administrator (optional)

viii. Describe the documents that will be produced as a result of the JAD Sessions, i.e. business requirements, uses cases, etc.-

The Wipro/IBM team proposes a standard set of deliverables. Depending on the requirement need one or more of these document types will be leveraged as part of the output from a JAD session. The outputs are outlined in the table below.

Table IV-26: Reports Included with Rational Requirements Composer

Report name	Description	Target stakeholders
Audit History	Presents an audit history of each folder and artifact in your project to provide an overview and a detailed artifact activity table. This is useful for reviews and regulatory checks.	For reviews or for regulatory checks: Solution sponsors Project managers Business analysts
Requirements Specification	Presents attributes by artifact, where attributes are organized by requirement type	Business analysts Architects Testers Developers Solution sponsors Subject matter experts (SMEs) Project managers

Traceability	Presents each artifact, plus and a table for all outgoing links and one for all incoming links	Solution sponsors Business analysts Project managers
UI Spec (by screen flow diagrams)	Displays screen flow diagrams first and, subsequently, selected user interface sketches	Lines of business, SMEs Business analysts Architects
UI Spec (by storyboards)	User Interface Specification with selected storyboards as scope (the report is presented in storyboard steps with a corresponding UI sketch for each, and the scope is defined by the storyboard)	Lines of business, SMEs Business analysts Architects
UI Spec (by UI sketches)	User Interface Specification that comprises selected UI sketches with corresponding widget details for each sketch (the scope is defined by the selection)	Lines of business, SMEs Business Analysts Architects
Use Case Spec (by use case diagrams)	Reports on a specified use case diagram; includes a list of actors and use cases and provides details of all use cases specified in that diagram (includes only full use cases, not proxy use cases)	Lines of business, SMEs Business analysts Architects Testers
Use Case Spec (by use cases)	Reports all use case details by use case name	Lines of business, SMEs Business analysts Architects Testers
Review Progress	Details the progress and content of selected reviews (includes lists of reviewers, artifacts, and comments according to artifact)	Business analysts Project managers Lines of business, SMEs

ix. Describe any tools that will be used in these sessions and the orientation and training participants will receive in using these tools.

IBM Rational Requirement Composer is the requirement elicitation and collaboration tool, which can be accessed using a standard Web browser that the Wipro/IBM team intends to use. Rational Requirements Composer allows for the creation of a custom dashboard with multiple pages, each displaying a customizable view of a given project. Such functionality allows an individual managing one or more requirements to quickly investigate the desired information. Each page contains custom viewlets, each with a specific purpose. As part of the project inception, the Wipro/IBM team will work with the *SmartPro MedEE* leadership team to identify the required view to meet the State's desired needs. An example interface for requirements management orientation and training participants is presented in Figure IV-103.

Figure IV-103: Sample Interface for Requirements Orientation

- x. Describe how the documentation from the JAD Sessions (e.g., Department decisions, approved notes and updated requirements) will be collected and stored in the State of Nebraska's Document Repository. This description must include the process for collecting the data that will update the Requirements Traceability Matrix.

Documentation from the JAD sessions will be stored in IBM Rational Requirements Composer. We intend to provide the MLTC access to the tool over the Internet. As per license agreement with IBM, we can provide review and approval access to customers for documentation review.

Traceability is the backbone of a requirements management tool. Being able to create relationships (links) between requirements and from requirements to other lifecycle elements is one of the primary reasons that organizations choose a requirements definition and management solution. Tracing and understanding relationships between requirements and lifecycle artifacts are crucial to project success. Links not only denote simple connections from one piece of information to another, they also indicate further meaning or significance. There is usually a justification for why a link is created, which motivates further analysis of that link in a query report.

Requirements Composer now provides a built-in graphical links explorer that allows the analyst to interact with requirement links and to use them as primary elements in a requirements process. Figure IV-104 provides an example output of the graphical relationship between Composer to a series of related requirements gathered during a single JAD session.

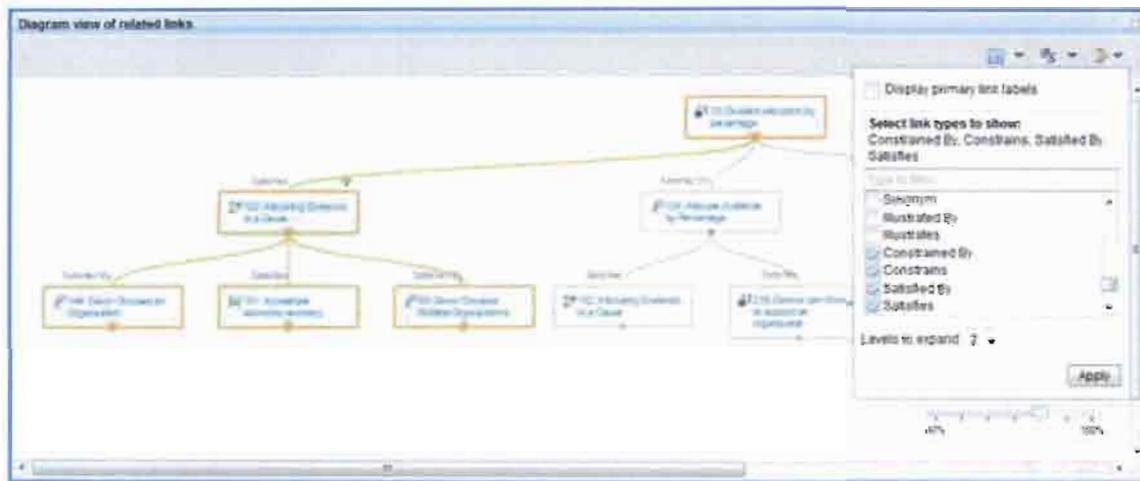

Figure IV-104: Graphical Relationship of Rational Requirements Composer to Requirements

- xi. Describe the process for finalizing requirements, documenting the results and incorporating information from the JAD Sessions, maintaining a Requirements Repository throughout the life of the project and ensuring the requirements continuously reflect the approved project scope. The requirement repository must reflect the current scope of the project.

Each requirement created during a JAD session is assigned a unique identifier. Relevant categories will be assigned to a requirement that covers all the phases of the JAD cycle, including validation. The expectation is that the following will be accomplished for each given requirement submitted as part of the project.

1. **Requirements reviews:** An overview of the requirements for the given problem will be documented. The business analyst will provide a high-level state of what the problems are and what are the assumed needs identified by the stakeholders.
2. **Systematic manual analysis of the requirements:** The business analyst shall document all the requirements and approaches discussed during the JAD session. The final approach shall be documented in the greatest detail so that a proposed prototype can be created.
3. **Prototyping:** All paper prototypes shall be submitted to the system as an attachment. Any links to systems iterations shall be submitted to ensure a consistent system of record.
4. **Using an executable model of the system to check requirements:** A repeatable use template will be leveraged to ensure to ensure all checks and balances are completed as part of the executable model.
5. **Test-case generation:** Upon completion of a requirement being prototyped and documented completely, a test case shall be generated for one or more parties to test the application for completeness and operationalization.
6. **Developing tests for requirements to check testability:** A repeatable benchmark test, which will be identified at the beginning of the *SmartPro MedEE* project, will be executed by the appropriate team to ensure the requirements meet rigorous testability.

7. **Automated consistency analysis:** By using a COTS requirements management tool, the Wipro/IBM team is ensuring automated consistency and analysis for the entire JAD process associated with each requirement.
8. **Checking the consistency of a structured requirements description:** Similar to automated consistency analysis, the requirements management tools being proposed link functional and non-functional needs together in a consistent manner using a repeatable, predictive process.

xii. Describe the process that will be used to identify new requirements and describe how these will be presented to the Department.

All requirements are baselined in the Requirements Traceability Matrix, which is contained in the IBM Rational Team Concert application. RTC supports configuration management and traceability of each requirement to other project artifacts. Before a requirement is approved, it is placed into a requirements workflow. In collaboration with the Department, this workflow will be configured to support our change management processes. This process includes a change control board that approves all processes that have been previously baselined. The change control board is represented by key staff from both the customer and the vendor organizations. Prior to the change control board meeting, the requirements under consideration will be provided to the board, with accompanying documentation to clarify the nature of the requirement. Accompanying documentation will include the cost of the change (if any), the scope of the change (hours) and the impact to the project (schedule) as well as any accompanying risk.

Based on the decision of the change control board, the requirement will be approved, pended for further review, or denied. If the requirement is approved, then accompanying project management artifacts (Schedule, Cost, etc.) will be updated.

xiii. Describe the process for developing the Business Process Gap Analysis including how changes to the Business Process Models and Requirements Traceability Matrix will be tracked, and the content of the Gap Analysis Report.

During the RFP proposal process, the team has created the gap analysis report, which is contained in our response to Appendix D. This gap analysis is created by analyzing the detailed Appendix B and C requirements, against the baseline *SmartPro MedEE* solution. Any differences between our baseline solution and the requirements contained in the Appendices are noted as gaps. These requirements and associated gaps are then considered when developing the To-Be business process diagrams.

As the Business Process Change team works with the MLTC to create the To-Be process models, the team is noting any additional gaps, and capturing these gaps as new requirements in the Requirements Traceability Matrix. These new requirements are then processed through the change control process using mutually agreed-upon thresholds. These thresholds will be based on impact to the project schedule, quality, cost, and resource allocations.

xiv. Describe the interaction that will take place among the Contractor's staff and the Department's Business Analysts and Technical Review Teams during the Requirements Validation process.

The Wipro/IBM team believes the relationship between the State and our team shall be one of collaboration. During each working session to identify requirements, including the validation

meetings, members of the Business Analyst Staff and Technical Review Team will be invited to participate. We fully embrace feedback during these sessions as the MLTC is our customer. If interactions occur outside of working sessions, the Wipro/IBM team will have a point of contact for functional requests made by the Business Analysts and a Technical point of contact for technical related matters. These delegated members of the Wipro/IBM team will mitigate all issues by assigning the questions to the appropriate party so that the requirements validation process is operationally succinct and technically smooth.

12. Business Rules Configuration

The Wipro/IBM team will follow the *SmartPro MedEE* best practices for identifying rules changes and configuration. These best practices have proven successful on multiple Medicaid and Health Insurance Exchange implementations. As part of the construction process the project team will ensure that the MLTC staff has a thorough understanding of the rules lifecycle, development, and usage.

The Wipro/IBM solution delivers comprehensive rules management capabilities by providing rich, prebuilt rules content, a rules composition and execution environment with the MITA compliant *SmartPro MedEE* rules engine. *SmartPro MedEE* provides robust capabilities to handle eligibility and entitlement determination in automated fashions including rules-based business processes; *SmartPro MedEE* has been designed to address the unique challenges faced by Health and Human Services agencies with regard to rules management in support of program delivery, organizational efficiency, and enhanced client service. The Cúram Express Rules (CER) environment provides the functionality necessary to support a range of rules-based business processes in *SmartPro MedEE* solutions. The web-based documentation provides comprehensive coverage with context and extensive documentation on CER.

Key Features of IBM SmartPro MedEE rules management capabilities include:

- Flexible and high performance rules environment
- Business user friendly rules editor with Health and Human Services specific content
- Easy to understand summary of complex eligibility rules
- Automatic change in circumstances detection and handling
- Configurable deduction rules to recoup payments
- Extensive Out of the Box capabilities compared to

Cúram Express Rules (CER) Environment

- CER is a versatile and adaptable rules environment that supports the definition, creation, and execution of rules to support a range of business functions commonly required by social enterprise agencies allowing for ease of extension and maintenance. CER supports a multiple step decision business process for areas such as Triage, Screening, Eligibility, and Change of Circumstance. The CER environment consists of the following components.
- CER Editor – provides a user-friendly tool for business analysts and developers to storyboard, design, validate and construct rules, and link rules to data.
- CER Engine – executes rules on demand at runtime in order to output business-based calculations. The CER Engine is a backward chaining “calculation engine” that calculates

“attributes” that represent logical results. An attribute can be calculated from other attributes, from data on the Cúram data model, or obtained from an external source. Attributes are automatically verified to their data types and format.

- Pre-built rules objects and paths for various business processes to follow allowing for object reuse and inheritance.
- Rules are exportable and storable within easy to interpret XML formats that the CER Engine interprets for execution.

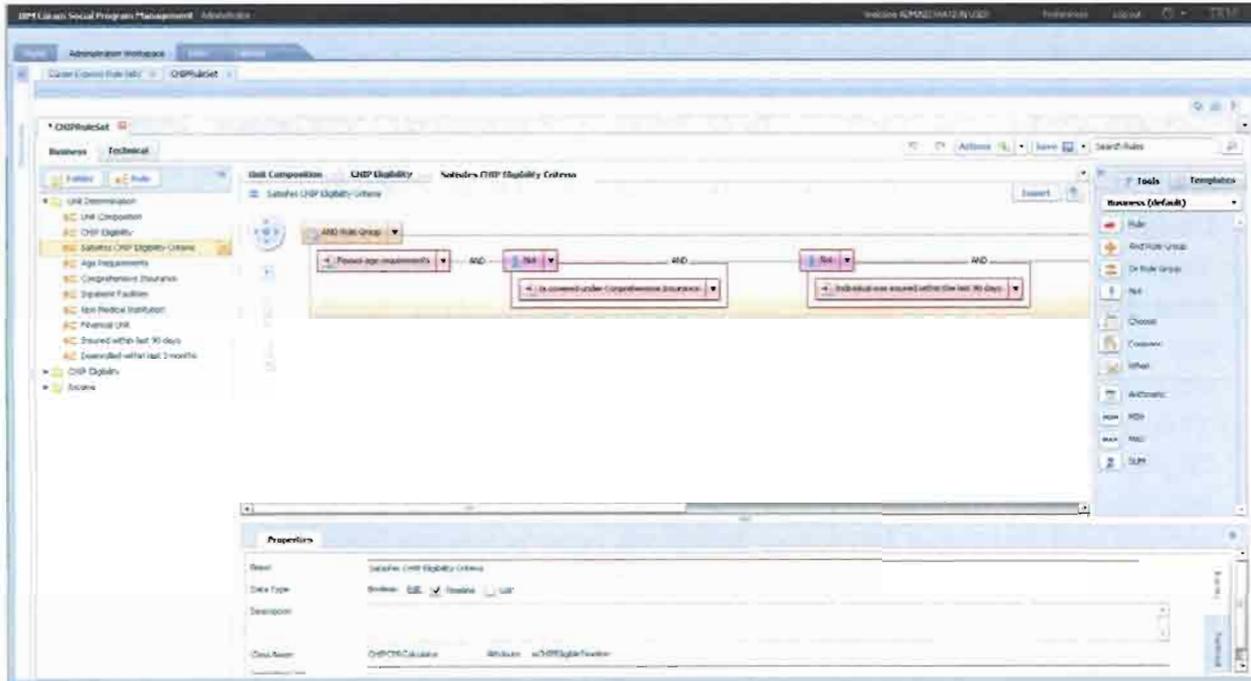

Figure IV-105: CER Rules Editor

Six major steps are identified for creating and deploying rules, as depicted in Stages in Deploying Rules using the *SmartPro MedEE* graphic. These key steps will be used to leverage the OOTB rules along with adapting to the legacy rule sets in the mainframe system. The CER Editor is designed to reduce the effort involved in each stage.

Figure IV-106: Stages in Deploying Rules using the *SmartPro MedEE* solution

- **Requirements Identification:** The starting point for development of a *SmartPro MedEE* rule is usually a change in legislation or mapping to a specific local government policy. Often, a change in legislation will not require a distinct business or process rule. Understanding and interpreting the meaning of the rule almost always involves significant investigative work, which simply cannot be performed by a software tool. The complexity of this step can be alleviated by the fact that either: (a) the rule is delivered OOTB in the *SmartPro MedEE*

solution, or (b) the rule, or a subset of the rules from which the rule is derived are already available in a prebuilt, searchable, and cross-referenced vocabulary.

- **Analysis/Interpretation:** First, a new rule or an extension to an existing rule, and the related dependent rules are identified and collated into a discrete requirement description. The next step is to identify references to existing rules and data and then to identify what other rule derivations need to be produced. As part of this step, data is identified that needs to be captured to support the new (composite) rule. At this point in the process, a business analyst will start using the CER Editor to construct conceptual rule diagrams. Navigating the business diagrams in their rule and associated rules, the analyst can determine if prebuilt content already exists that will satisfy the modification. Rules development within *SmartPro MedEE* is designed to reuse prebuilt and locally developed rules. The purpose of this stage is to start the process of defining the new rule, in preparation for its design.
- **Design:** The next step in the rules development process is to further enhance the rules diagrams created in the Analysis/Interpretation step. This step is usually carried out by a designer/developer using the same artifacts that the analyst worked with in the previous step. The designer always has the option of switching to a more technical view of the rules artifacts if desired. The advantage of this approach is that as the analyst and designer work in tandem to elaborate each other's work, they are dealing with the same familiar rules diagrams. Changes made by one will immediately be recognizable to the other. During this step, the designer will work to improve the overall rules design. Once the designer is satisfied with the rules design and data source definitions, construction can begin.
- **Construction:** The Construction step further enhances the rules diagrams, introducing a number of key concepts that are fundamental to successful eligibility and entitlement processing, including:
 - Linking rules to data using a Rule Object - which is a reference to actual data in the *SmartPro MedEE* database, for example, client, case, or rates data.
 - Addressing Timelines - Data (evidence), rules and rates change over time and these changes affect eligibility and entitlement. In *SmartPro MedEE*, a timeline is associated with a Rule Object. Change in a timeline will be immediately reflected in the eligibility and entitlement calculation.
 - Allowing for Data Attribution - Different programs can have different rules regarding which data should be used for which period; these are referred to as Attribution Periods. Even though the same data may be used in multiple programs, each program may attribute it differently, for example, Program A may consider a bank balance increase from the start of the next month, while Program B may consider it from the start of the current month.
 - Creating Decision Summaries - A Decision Summary is a configurable explanation of an eligibility and entitlement calculation. It is targeted at both the user and the client and contains facts and intermediate calculations relating to an eligibility and entitlement determination.
- **Testing:** Fundamental to the success of rules testing is the creation of unit tests that automate the testing of rules. The recommended approach to testing rules is to conduct

testing along the way as part of the construction process. Developers may test in their local environment iteratively from single rule attributes, to end-to-end case scenarios separate from application logic. *SmartPro MedEE* enables the execution of rule unit tests in batch mode, which facilitates regression testing of rules.

- **Deployment:** Rules construction and testing will usually occur in a test environment, separate from the production environment. As such, changes made in the test environment first need to be migrated to the production environment. The Cúram Configuration Transport Manager (CTM) provides the capability to transfer configuration data such as CER data between environments; development, test (System Test, UAT) and production. Once the rules configuration data has been transferred to the production environment, a user with appropriate security access must publish these changes for the new configuration to take effect. The CER Engine will detect the changes that have occurred and schedule a reassessment that is executable online or through batch processing.

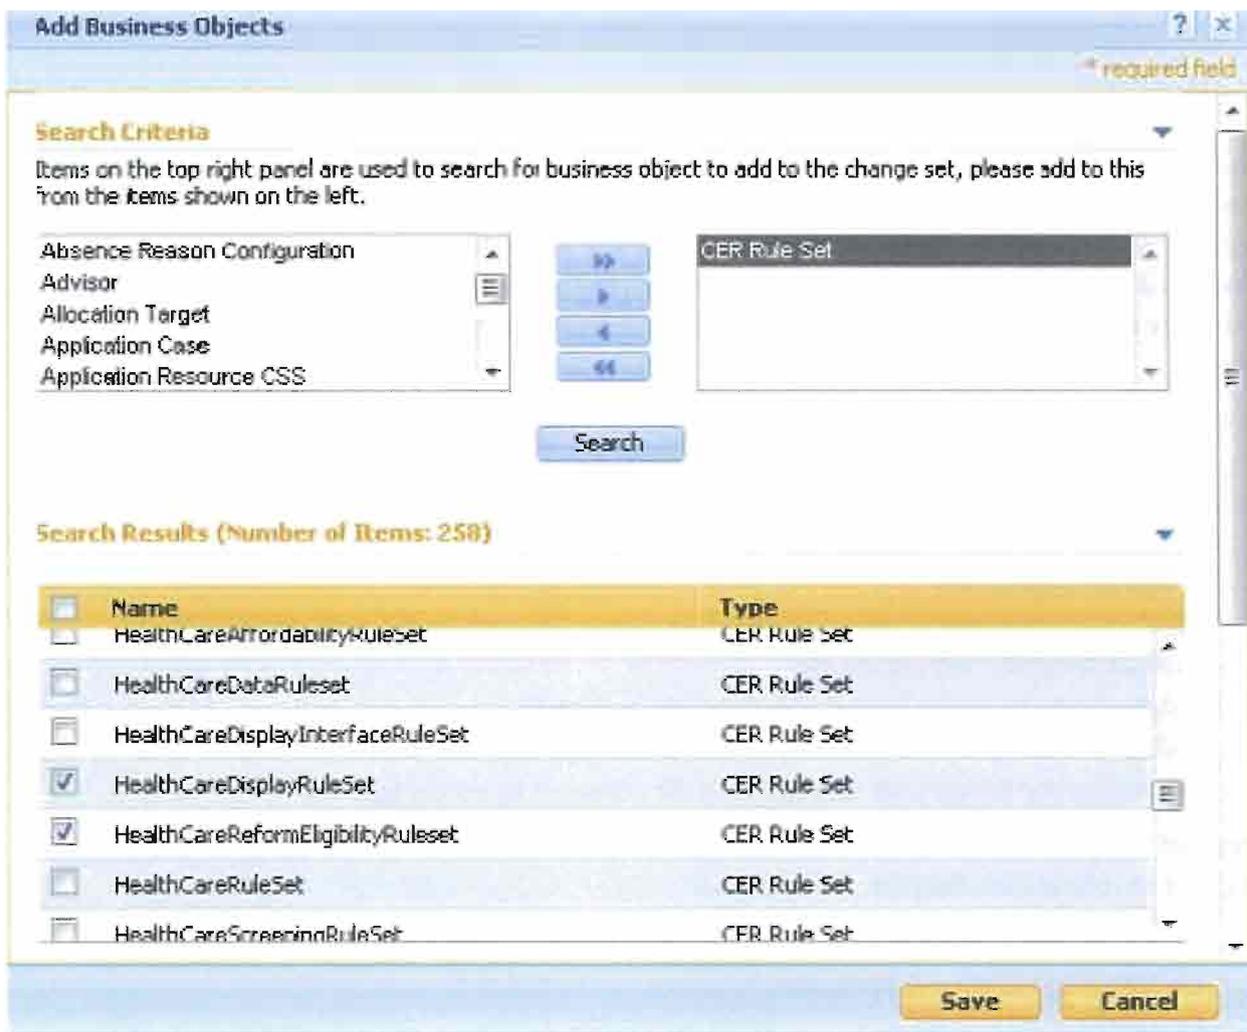

Figure IV-107: Configuration Transport Manager Example

Skills for Configuration of Business Rules

SmartPro MedEE provides detailed documentation, automatic business diagram construction and out-of-the-box pre-built content examples that minimize the learning curve for business rules configuration. Typically the key part of maintaining rules is knowledge of the local policies and the overall business processes on a multi-year cycle. The Wipro/IBM rules analysis and development team will have a high level of understanding for:

- Storyboarding, fit/gap, and understanding the impact of a government policy throughout an eligibility and enrollment system
- Subject matter expertise in the Affordable Care Act as pertaining to a federal based exchange and State Medicaid system
- Rules documentation experience in table and written form
- Previous experience in simple to complex test cases for rules and Medicaid scenarios

13. System Design

i. Describe how the SDLC will be applied to accomplish the System Design Task;

The system design phase of the SDLC will target in arriving at a robust design taking into consideration the objective set in the requirement phase. The system requirements along with the various constraints identified in the requirement phase will be analyzed to derive the system architecture design. All design alternatives will be analyzed through quantitative analysis before the finalizing the high-level design. Some of the key tasks that will be carried out to accomplish system design are:

- Evaluate the constraints identified in requirement phase
- Identification of possible sub systems and interfaces
- Identify design alternatives and identify the right design by using quantitative measurement approaches like field force analysis
- Design the application
- Establish effectiveness of design considering factors like robustness, performance, risk, schedule, Security, integration etc
- Design review by design team headed by lead architect
- Produce the design spec which will be defined at high level and detailed level tech spec
- Conducting the design walk through with the customer to get the sign off

The detailed design feeds the input for the development phase. Wipro/IBM will apply the ETVX criteria for each phase including the design phase.

ii. Explain how Project Management, Quality Management, and SDLC methodologies will be employed to control the development of deliverables;

Wipro Talent Transformation team has created a Project Management Academy (PM Academy) which includes the best of PMP and Prince global project management trainings. The Wipro Talent Transformation team ensures that all our project managers are PM academy certified to ensure we provide the best of project management experience to our customers. Below are some of the key project management activities to ensure control over development of deliverables.

- The project manager has the overall accountability for the on time delivery.
- The project manager coordinates all the review activities for the deliverables
- Identify the risk identified with the deliverables and arrive at mitigation plan
- Define a mitigation plan and alternative approaches to key issues identified in the project
- Define the review and testing cycles for the deliverables
- Coordinate the defect triage meetings and decide the priority and severity of the defects
- Ensure the defects are allocated and addressed by the team based on priority
- Coordinate with quality team and customer team for the quality gates
- Coordinate with quality team on review effectiveness and defect prevention Wipro initiatives like DRFT
- Conduct LAM (Look Ahead Meeting) and lessons learnt whenever required to ensure the lessons captured from one deliverable are taken care in the future deliverables

Wipro has a dedicated Mission Quality team which guides delivery team to deliver projects of the highest quality. A quality management plan which will act as a quality roadmap for the account will be drafted and shared with the team. The quality management plan will cover both quality control and quality assurance activities. Wipro has defined all the process, procedures, guidelines, and checklist in Velociq (Wipro QMS) which acts as the guidance to delivery and quality teams to ensure delivery with quality. The process controls are put in place to avoid undesirable outcomes. These are validated through well-defined checklists which are defined at phase and deliverable level.

The following key tasks will be employed as part of quality control activities.

Review and Inspection – Reviews and Inspections are performed to ensure that the items that are reviewed or inspected are complete, correct and fit for use. The process applies for both documents and code written. Wipro has implemented DRFT (Doing Right First Time) as part of its quality process. This is achieved by implementing effective reviews and inspection throughout the life cycle of the project. All reviews are planned as part of the project plan. Wipro's QA procedures include the reviews performed by Peer Review team (PRT). Normally, PRT reviews are sought for all client deliverables. The concept of PRT reviews is implemented in Wipro to ensure validation of the quality of the deliverable by someone other than the author of the document / code.

Testing - Wipro follows a comprehensive approach for testing to make sure that the product developed meets the requirements. Testing is conducted at several levels during the project development life cycle. Some of the typical testing cycles that are conducted during development phase are Unit Testing, System and Integration testing, User Acceptance tests, and Performance testing. Errors/defects are classified as fatal/major/minor for severity. Defect logs are tracked and analyzed to identify and improve the weaker areas. Daily defect triage meetings have been implemented by Wipro in many projects with significant success.

Quality Gates: Wipro has defined quality gates which incorporated the EXTV model. ETVX stands for

E- Entry Criteria which is an input to the current phase and usually an output of the preceding phase

T- Tasks or procedures that are performed on the input to produce the necessary output

V- Refers to the verification and validation activities like reviews and testing activities that are performed on the output to validate whether the deliverables are created right and whether the output deliverables match the desired expectations

X – defines the exit criteria that should be fulfilled to end the process or phase

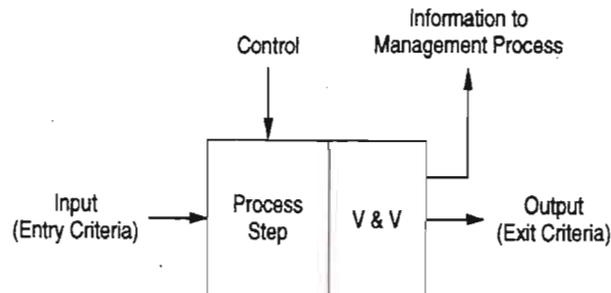

Figure IV-108: Quality Gates

It is important to follow ETVX concept for all phases in SDLC. The Quality representative either a QC or QA who are an independent entity will coordinate with the delivery team to perform the quality gate. This is to ensure there is no compromise in the quality of the deliverables.

Audits: Test audit is conducted for all the major deliverables of the project like design document, unit tested code etc. by an External Review Team (ERT). The External Review team (ERT) typically comprises of members who are not part of the project team. This helps to bring in an external perspective to ensure product quality.

Traceability: A bi directional traceability matrix will be maintained by the team which gives the mapping between requirement and all the deliverables spread across all the phases. This will be validated by the QC or QA as part of the exit criteria for each phase

iii. Describe the format and medium that will be used for the design documents and demonstrate how the design will be presented in a fashion that can be understood by a wide range of users using the tool to cross-reference requirements;

The Software Development Life Cycle (SDLC) helps to manage project complexities. The formats recommended by SDLC which is adapted by Wipro for representing design are

- Hierarchy Charts – is a pictorial representation showing the relationship between the various modules of the system
- Data flow diagrams - is a graphical representation of the flow of data in the system
- Structured representation through deliverables is achieved through clear and concrete explanation of the design which covers both HLD (High Level Design) and LLD (Low Level Design)
- Entity Relationship diagram is a data model to represent data in an abstract way to give a visual representation of different data and how the data are related to each other
- Structure charts – helps to breakdown a system to its lowest manageable levels

The Architect will use the most suitable formats required based on the audience to ensure the design is understood by the wide range of users

iv. Describe the system design deliverables and artifacts, and provide samples;

The description of the system design deliverables are listed below. Please refer to Appendix C1 and C2 for more details on the deliverables as per phase and template.

Table IV-27: System Design Deliverables

Artifact	Description
Design Document	Contents are Purpose, Assumptions/Constraints/Standards, and Alignment with Federal Enterprise Architecture, Architecture Design, System Design, Version Control, Approvals, References, and Key Terms.
Physical Data Model / Data Model Diagrams	Contents are Purpose, Assumptions, Constraints, and Logical data model standards, Logical Data Model, Version Control, Approvals, References, and Key Terms. Contents are Purpose, Assumptions, Constraints, and Physical data model, Physical Data Model, Version Control, Approvals, References, and Key Terms.
Release Strategy	Contents are Overview, Assumptions, Constraints, Risks, Release rationale, Strategy, Content, Schedule, Impacts, Notification, Management, Numbering, Approvals, Version Control, References, and Key Terms.
Data Conversion	Contents are Purpose, Data Conversion Objective, Assumptions, Constraints and Risks, Conversion Scope, Approach, Roles and Responsibilities, Schedule, Data Quality Assurance and Control, Conversion Preparation, Specifications, Version Control, Approvals, References and Key Terms
Interface Control	Contents are Interface Controls, Version Control, Approvals, References, and Key Terms.
Implementation Planning	Contents are purpose, assumptions, constraints, planning, workforce changes, employee transition, business process, technology requirements, implementation, transitioning, and training.
Capacity Planning	Contents are purpose, solution requirements, assumptions, constraints, analysis of capacity and findings summary
Contingency Plan	Contents are purpose, background, applicability, scope, assumptions, system description, line of succession, responsibilities, testing and maintenance, notification and activation, recovery operations, return to normal operations, original or new site restoration, concurrent processing and plan deactivation
System of Record Notice (SORN)	Contents are system name, system classification, system location, categories of individuals covered by system, categories of records in the system, authority for maintenance, policies and procedures for storing, retrieving, accessing, retaining and disposing of records in the system
Test Plan	Contents are Purpose and Scope, Resource Requirements, Assumptions, Constraints and Risks, Testing Approach, Unit Testing, Functional Testing, Load Testing, Volume Testing, Acceptance Testing, Usability Testing, Compatibility Testing, Conformance Testing, Regression Testing, Stress Testing, Vulnerability Assessment Testing, Progress Reporting, Appendix Summary, Test plan approvals, References, Key Terms, Test Summary Report, Bug Report/Defect Log and Versioning.

- v. Describe the Technological Overview of the proposed architecture and clearly describe how the design and development approach will be specifically tailored to this technology;

Nebraska's Enterprise-ready Medicaid Eligibility and Enrollment System

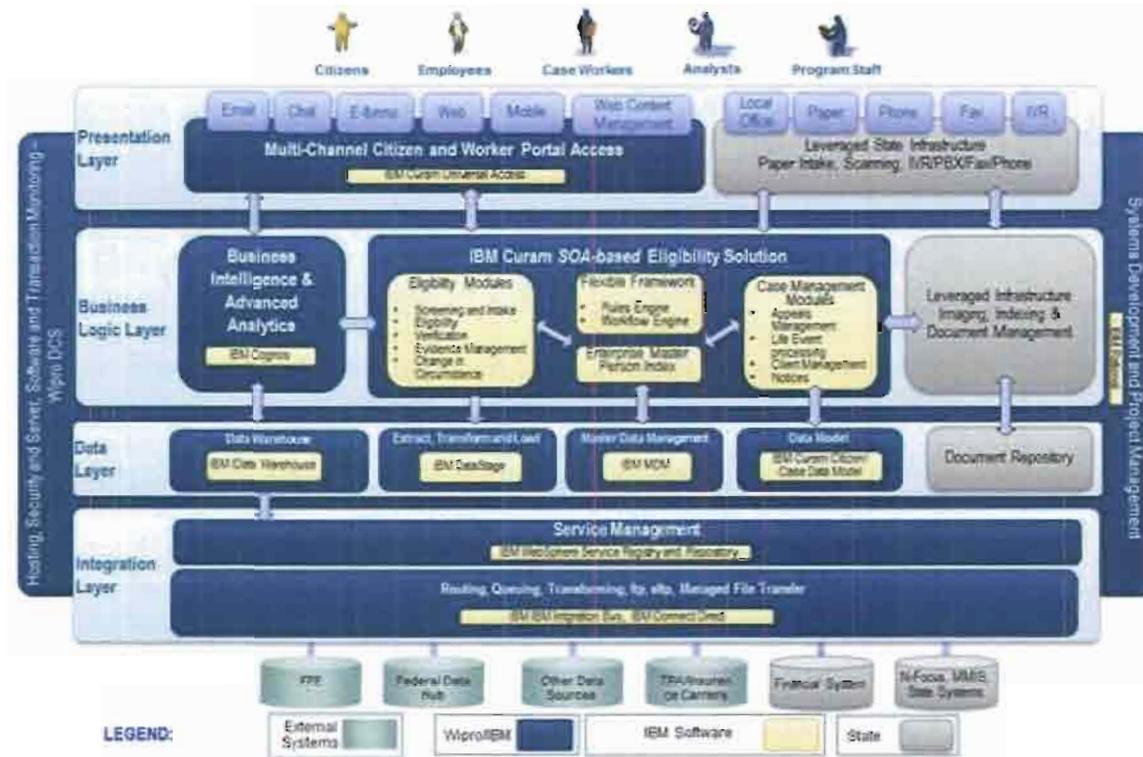

Figure IV-109: Technological Overview

We propose a four layer SOA based technical Architecture:

1. Presentation Layer
2. Business Logic Layer
3. Data Layer
4. Integration Layer

System Design and Development approach is customized to align with the technical architecture. These phases will have 5 work tracks, working very closely to ensure dependency among various components of projects are tracked and managed. These tracks will be:

1. Portals and user presentation
2. Curam functional customization
3. Data Warehouse, Analytics and Reporting
4. In-bound and out-bound interfaces integration
5. Independent Testing team

Activities across various tracks will be monitored and coordinated through PMO (Project Management Office).

- vi. Describe how the tool(s) will be configured to assist both Contractor and the Department staff in the system design tasks;

We propose to use below tools for Design phase:

- ER Studio – Data Model Design
- IBM Rational Team Connect – Communication, Change Management, Configuration Management
- Rational Software Architect – System Architecture design
- MS Project Professional – Project Management
- Adobe Acrobat XI – Design document production

These tools will be configured for contractor staff (working on the projects) as user of the tools to develop system design components and documents. These tools will have view access for department staff to review deliverables produced, provide feedback and comments on the Work In Progress deliverables.

- vii. Describe the process that will be used for the review and walk-thru of the design documents; and

Wipro recommends a three staged approach for architecture and design document review. The design review process stages are

- **Discovery** - Focuses on understanding the context, requirements and the architecture
- **Review** - Core of the review process where the architecture is validated using a review checklist and framework
- **Recommend** - Discuss, validate and implement the review findings

The key team members who will be associated in the design review are Architect, Project Manager, Business Analyst, Review Lead, and review team members.

The Architect acts as the single point of contact through the review process. Architect presents the architecture decisions, quality attribute requirements, architecture views, and thought process behind the architecture

The design documents (high-level design and low-level design) walk through will be headed by the Architect where the design architecture will be presented to the client. The presentation will cover application, technology and data architectures, environmental constraints, risk mitigation strategies if applicable.

- viii. Describe the interface and interactions that will take place among the Contractor's staff and the Department's Business Analysts, Technical Review teams and other stakeholders during the System Design process.

System design is an important phase in the SDLC where the high level and low-level design for the system are derived. The design alternatives are evaluated using quantitative models like field force analysis to derive the best possible system design. An effective interactive platform between the business staff and Wipro/IBM plays a key role to arrive at an effective and robust design.

Requirement elicitation meetings with the Wipro/IBM delivery team, architect, and Business analyst will be conducted to understand the details of the requirement and the possibilities of converting the requirements to system design. Wipro/IBM team will be collating all the queries where they need clarification from the customer and periodic clarification meetings will be conducted between Wipro/IBM and customer team

The architect team and the lead architect for the project will conduct periodic discussions with the delivery team to review the progress and provide any directions if required for the delivery team on the architectural aspects of the design

The test lead and the test team members will have weekly meetings with the delivery team to understand the design and accordingly design the test plan and test case for the project. This will be an internal meeting and a customer interaction will be required only on a need basis

Discussion meeting between the team and security team will be held to ensure all the information security aspects are evaluated. The counterparts on the customer information security team (if exists) will also be included in the design review meetings to get the signoff from the customer security team.

Design review meetings will be planned at two different stages where the first stage is an internal meeting where the system design is derived based on all the inputs received will be reviewed.

Design review comments are logged and tracked to closure. The second stage of design review will be with the customer team where the design will be reviewed to get the customer review comments and make any necessary changes as needed.

Wipro/IBM team will conduct a joint design walk through which will be attended by Wipro/IBM and customer team leading to the sign off unless and until there is a need for rework.

14. Development

i. Describe the relationship between the System Development Task and other SDLC tasks;

SDLC or Software development life cycle tasks start from the statement of work or SOW for the new system till the system is developed, tested, and handed over to the maintenance and support team. The SDLC methodology for this project recommended by Wipro/IBM is **SmartPro MedEE** Methodology which is a combination of waterfall and iterative approach in design and development phase. The SDLC tasks are classified into 3 broad areas which are:

- Pre project – Focuses on project initiation and conceptual phase to ensure a smooth start to the project
- Project – This is the main lifecycle starting from planning till implementation phase
- Post Project – This phase is to ensure the smooth hand over to the maintenance and support team

The system development tasks are more focused on creating the system based on the design finalized in the earlier phase. A requirement traceability matrix will be maintained by the team to ensure the system developed is in line with the requirements and design expectations. The system development

tasks will also ensure a complete unit testing of the system before ensuring a smooth hand over to the system testing team.

- ii. Provide an overview of software development activities that will be performed by the Contractor and the environment in which this work will be completed. This will include issues such as security, privacy, standards, and interdependencies in hardware and software development;

The infrastructure activities of procuring, installing, configuration, and testing the environment will be taken starting from the initiation phase. This will be completed before the end of requirement analysis phase. This approach will ensure the environments are available in time without any delay. The network installation, configuration and support activities will be provided from design till hand over. This approach will eliminate the interdependencies between hardware and software development

Environments	SDLC Phases									
	Initiation	Concept & Planning	Requirement & Analysis	Design	Develop	Integration Testing	System Integration Testing	User Acceptance Testing	Implement	Operations and Maintenance
D - Development team T - Test Team A- System Admin U- Business users										
Production									A,U - full performance, live data in real time	
DRR Prod (IDLE)									A- limited non DRR mode receive updates from prod in near real time	
DRR Prod (Active)									A- disaster recovery version	
Development					D - Near full functionality is available with limited capacity					
System Test						D, T - System testing and updates				
Integration Test							D, T - System integration testing			
QA (Small)								U-UAT with full functionality and limited capacity		
QA (Large)								U- UAT Load, Stress testing with full capacity		
Sandbox								U- dedicated state users for controlled testing		
Training							D,A, U - for training staff	D,T - for any updates required		
Data Conversion							D, T- Data conversion activities		D,T- Promoted from QA small or large	
PMO										

Figure IV-110: SDLC Phases

- iii. Describe the software development methods that will be used, including the use of iterative or phased development, if appropriate. This should include descriptions of manual and automated tools and procedures that will be used in support of these methods;

Wipro/IBM recommends *SmartPro MedEE* Methodology which is a combination of waterfall and iterative approach in design and development phase. This methodology includes the best features of both waterfall and iterative methodologies. Wipro/IBM's repository of comprehensive project management tools, processes, templates, artifacts and other resources will help the Wipro/IBM

team project delivery staff and the Department plan and execute projects with a detailed service-orientation focus. We will tailor our standard methods to include best practices for managing projects that have a diverse group of stakeholders. The methods Wipro/IBM brings to managing, controlling, and supervising contract services will offer the Department a proven and transparent project management strategy based on industry best practices.

Wipro/IBM will employ quality gates at the end of end phase to ensure all the activities required to be completed in the phase are completed. This will ensure the phase containment or the defects associated with a phase to be contained within the same phase and not move through the SDLC cycle.

Ecube is the project management tool used by Wipro/IBM to define the methodology and metrics used in the project. The tool generates the required metrics in the form of a report called the PDMR or project data metrics report which is reviewed by the project manager and delivery manager for corrective actions

The below diagram shows the pictorial representation of the *SmartPro MedEE* Methodology:

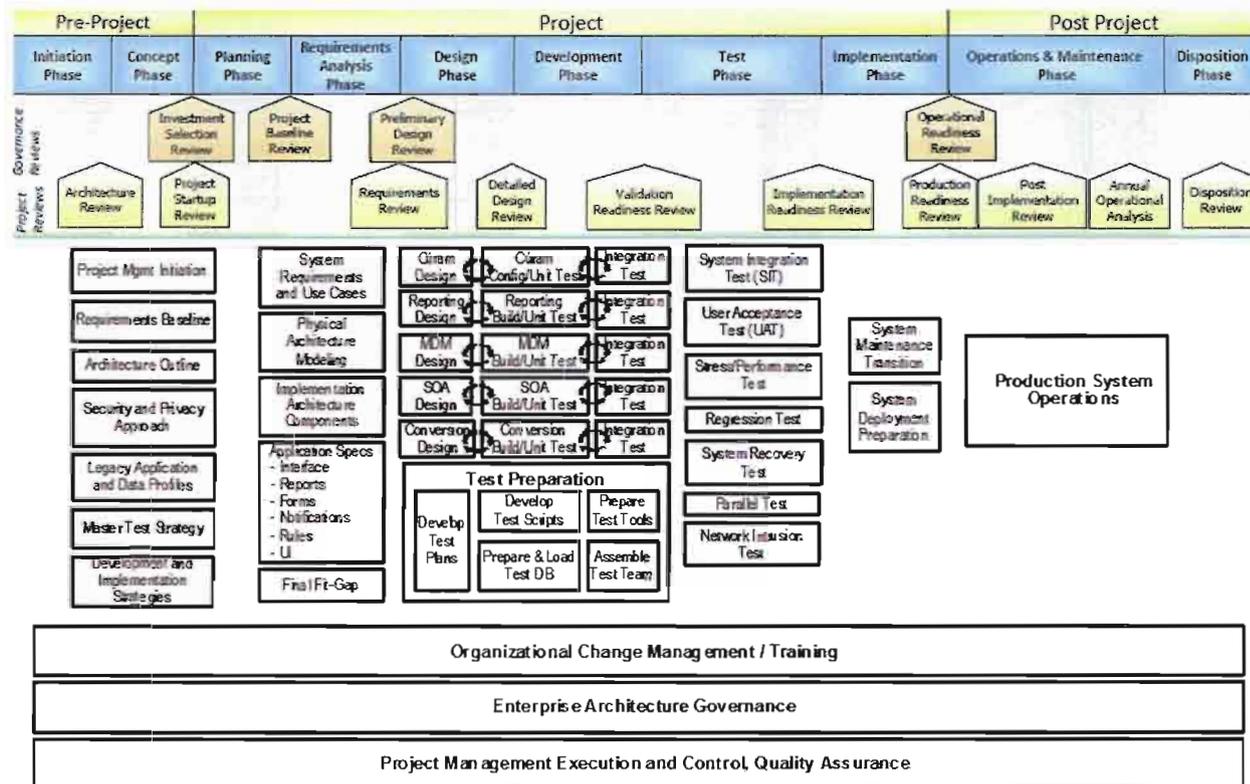

Figure IV-111: *SmartPro MedEE* Methodology

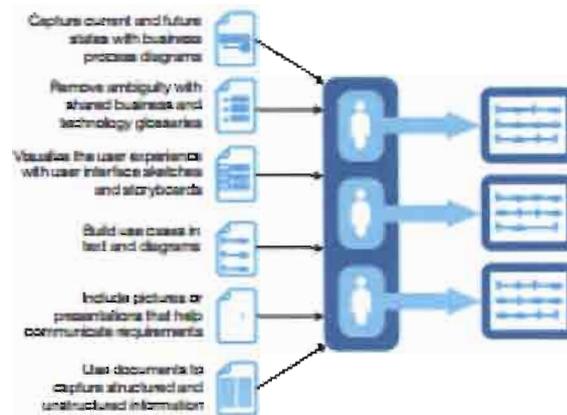

iv. Specify development tools that will be used, and explain its specific roles;

IBM Rational Team Concert, IBM Rational Software Architect, and Jenkins are the development tools that will be used during the Development phase

IBM Rational Team Concert - IBM Rational Team Concert software provides the essential development and business support to define and capture business needs and manage virtually all the requirements throughout a project lifecycle.

- Defining and managing the requirements - IBM Team Concert can help team members to link requirements artifacts to related information in a centrally located repository or project dashboard. With the IBM solution you can capture and connect rich information in multiple formats and share it with multiple users and projects. It offers search and filtering capabilities to help stakeholders more easily navigate volumes of requirement information.
- Addressing the entire extended team - The Rational Team Concert tool can help software development teams to maintain information in a central location or a project dashboard and also provide greater information visibility to the stakeholder. It offers a web-based interface to elicit, capture, elaborate, discuss, and review requirements.

IBM Rational Software Architect - IBM Rational Software Architect is an advanced model-driven development tool. It leverages model-driven development with the UML for creating well-architected applications and services. Rational Software Architect is a tool that enables software architects to model and design the architecture of their applications. The content that can be created within Rational Software Architect includes all kinds of UML 2.2 diagrams. It also includes features for automatic code generation starting from the models developed within the application. All content created in Rational Software Architect can be published to HTML and deployed to Web servers for distributed viewing. Rational Software Architect can also be connected to a number of other Rational lifecycle process tools in order to be fully used into the software process.

- Exploit the latest in modeling-language standards
- Modeling flexibility for teams
- Tap into the power of model-based automations
- Bridge the gap between models and code in Java, Web services, SOA, portal and C++ applications
- Integrate with other facets of the lifecycle

Jenkins - Jenkins is an open source continuous integration tool. Jenkins provides continuous integration services for software development. It is a server-based system running in a servlet container. Jenkins monitors executions of repeated jobs. Jenkins offer the following features

- Easy installation and configuration – Jenkins can be configured entirely from its friendly web GUI with extensive on-the-fly error checks and inline help

- Helps continuous integration by supporting automation builds, artifact management and deployment processes\
- The tool gives the flexibility to fit in a variety of environments and help streamline development process
- Supported by over 400 plug-ins
- The tool can also generate test reports and integrate with many version control systems
- Can be used to deploy directly in test and production environments

v. Describe the approach that will be used for unit and integration testing and the tools developers will have available to ensure testing is thorough and accurate;

Unit Testing

There will be a pre-established Unit test suite that will be run prior to any code release to a test environment. This test suite will be further divided into critical and comprehensive test suites. At a minimum, all critical test suites must pass with no errors prior to releasing to the test environment. Prior to release to the production environment, all comprehensive test suites must pass

Integration Testing

Given below is a high-level approach for Integration Testing.

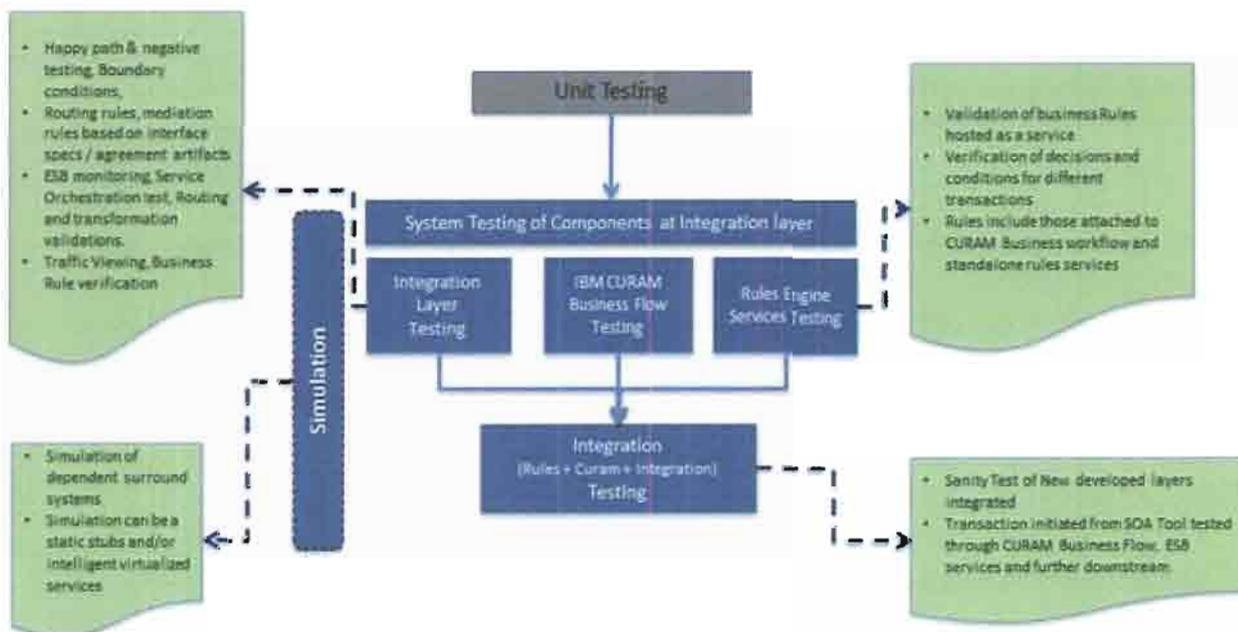

Figure IV-112: Integration Testing Approach

Integration testing will consist of the following Phases of testing

- System Testing of individual Components at Middleware and Integration Layer
- Integration Testing between different Components

System testing of individual components at Middleware at Integration Layer

System Testing will consist of testing the following Components at Integration layer

- *SmartPro MedEE* Business System Testing
- Rules Engine Services System Testing
- Integration Layer Services System Testing

***SmartPro MedEE* Business System Testing:**

Objective: System Testing Phase to validate and verify Business Process and/or Business Rules Management which delivers business workflows comprising processes, decisions, activities, and rules. This BPM/BRMS component of the middleware is the *SmartPro MedEE* capable of orchestrating multiple services in the landscape required for the success of the business operations initiated by the consumers. Some of the specific objectives are:

- Validation of Processes and its associated sub processes
- Validation of Manual Processes part of the overall workflow
- Validation rules, decisions and conditions

Approach: Business Process Management (BPM) is a process in which the business processes are aligned towards customer service expectation. This is well-planned and modeled end-to-end process orchestration of a complete customer service process. In this case *SmartPro MedEE* holds the business workflow for various processes.

Business Process Testing is performed in different test phases based on the complexity, constraints, dependencies, and challenges during the early phases of implementation. This Testing can be performed in three different phases/levels of testing as mentioned below in the picture

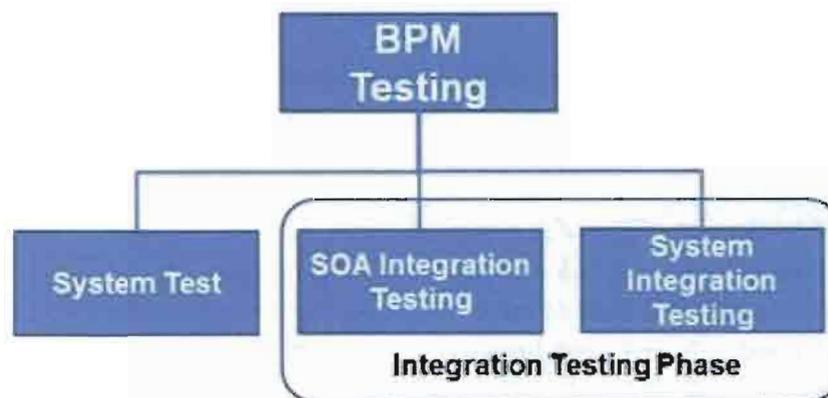

Figure IV-113: Business Process Management Approach

Choosing the appropriate phase to test the Business Process will be a decision made by the SOA Test team post the analysis of the size, complexity, surround systems dependencies, and other environment challenges.

In a System Testing we expect a medium to simple processes with limited constraints or dependencies which can be created in quick time in the test environments. With that assumption the following is the topology of a System Testing in a Test Environment.

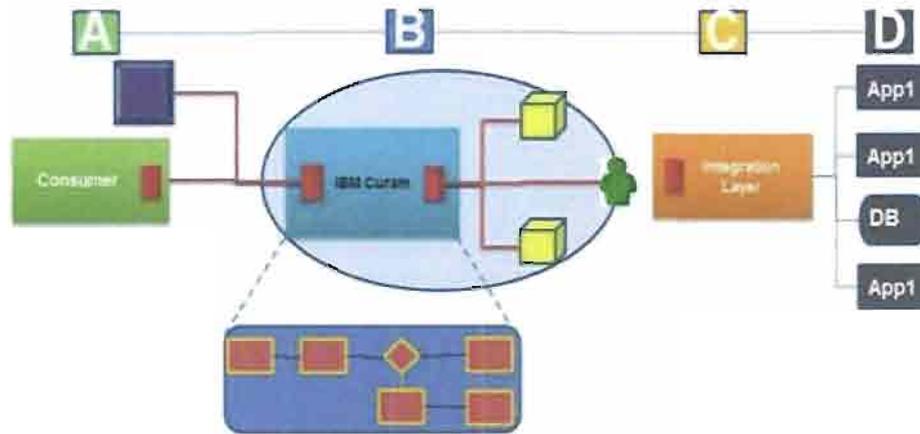

Figure IV-114: Test Environment Topology

Initiating System/Consumers [A]

As an initiating system for a *SmartPro MedEE* Business Processes System Testing, it can be the SOA Testing Tool client and/or the Consumer User Interface as well.

It is a challenge to generalize a *SmartPro MedEE* Business Processes System Testing to particular format and it is very much project or enterprise specific. Considering this section is about generic ways of testing a BPM, the providers services have been represented to cover all those touch points possible in a System Test on a Test Environment.

Rules Engine Services System Testing

Commonly called as Web Services Testing in a SOA testing world however in this document I have referred to this as a Services Testing representing the validation of Rules Engine as a service.

Objective:

- Verification and Validation of the rules engine services
- Testing of composite and atomic rules hosted on the rules engine
- To flush out early defects in the list of rules
- Validate custom error code and exceptions

Scope:

The scope of services testing is the rules exposed as Services exposed to other systems within MLTC infrastructure. These are the services apart from those rules attached to *SmartPro MedEE*.

Approach:

The general approach towards testing services is applicable in this case. The services are tested using a SOA Test Tool Client initiating the request messages in to the provider service.

Provider service will work on the request message and get in touch with further downstream systems if any and get back to the SOA Test Tool Client with a response. The response message is automatically validated against an expected result configured in the SOA Test Tool.

Integration Layer Services System Testing:

ESB Services System Testing (Integration Layer Services)

Objectives

- To verify and validate the functional and technical requirements of the Integration layer services
- Test various configured features and properties of the middleware in specific detail
- To flush out early defects with specific configuration and changes implemented
- Creation of Simulated Services using a recognized tools
- Validation of transformation, routing, aggregation features of the Message Broker and B2B Gateway specific to individual transactions or business flow
- Validation and conformance of all regulatory transactions against a Simulated Services

Scope

The Integration Layer services will cover the following components

- IBM WSRR
- IBM Integration Bus
- IBM Sterling Direct Connect

Approach

The following is the middleware System Test topology that will be in use during the system testing.

System testing of an Integration Layer will involve the following in a test environment

- SOA Test Tool - Initiating *SmartPro MedEE* Inbound Transactions
- IBM Integration Bus System under Test
- Downstream Service Simulation – Virtualized Provider Services

The same type of test environment will be used for Isolated Performance Testing. This is under the assumption that the environment has the capacity planned to host a limited performance testing.

Integration Testing between different Components

The high-level expectation of this phase is to test the layers built to support SOA brought together for the first time. This validation will certify the Test Environments and limited Integrated layers which will be used for End-to-End System Integration Testing.

Objective

- Validate the first time integration of layers which has undergone change and impact
- Shakedown tests when integrating the Integrated Layer, *SmartPro MedEE*, Rules Engine, downstream Service Layer and other surround services
- Exhaustive End to End Business Process Testing which is *SmartPro MedEE* and Rules Engine
- To flush out early defects during integration

- Validation of Integration scenarios below consumers with real surround and third party systems. Any service or application availability constraints will be Simulated but will be kept at minimal Basic Orchestration for selected popular business flow
- Service Versioning and Discovery

The below is the test topology of the SOA Integration Testing which is about testing the integration of Middleware components with provider services and other surround systems.

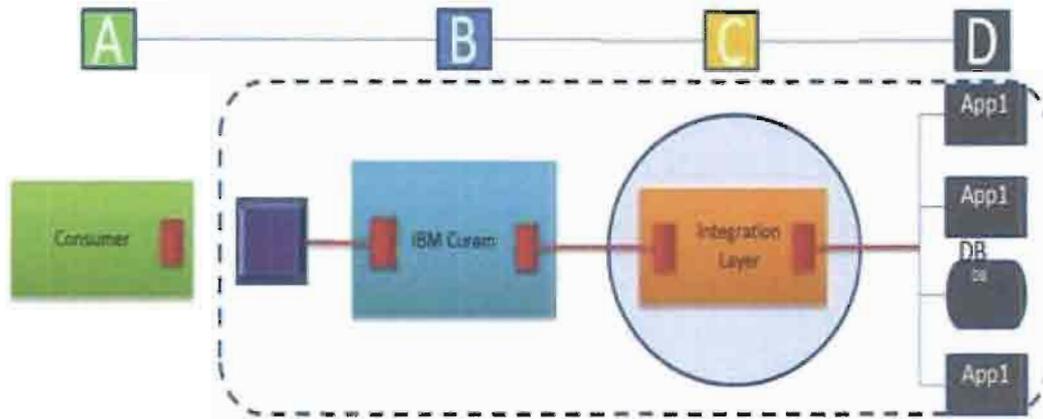

Figure IV-115: SOA Integration Testing Topology

Consumer [A]

This phase would have a SOA Test Tool Client replacing the consumer front end systems which would reuse the test suite prepared from the System Test Phase to be re-executed in the this new Test Environment integrated for the first time recreating the SOA Platform.

Cúram[B]

This is the *SmartPro MedEE* and Rule Engine component which is under test that will be integrated for the first time post the change with the downstream services and third party applications.

Integration Layer [C]

These are services hosted by the Integration Bus and IBM Sterling Direct Connect.

Host Systems [D]

The internal and external host provider systems delivering the services required to complete the workflow.

Tools

For the MLTC program, the Wipro/IBM recommended tool choice is Rational Integration Tester.

The recommendation is based on the overall technology stack and larger IBM platform presence both in Business and integration layers of the *SmartPro MedEE* solution. Rational Tool Product can integrate and interlock seamlessly with various IBM integration platform products and technologies that are implemented as part of this product.

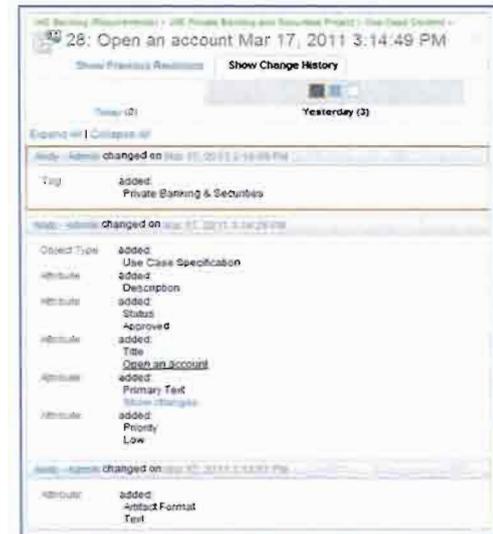

vi. Describe the approach that will be followed for tracking requirements during development;

Requirements Composer will automatically track and record who modifies information, what changes took place and when it happened. This information will be crucial when there is need to run reports like project efficiency or the churn in a project leading to delivery. Beyond tracking history Requirements composer also lets us capture baselines (or snapshots) of the project requirements which will give a version of the project at any point in time. Once again using a project baseline we will be able to compare change over time to see what areas of your project have had the most churn and change.

Rational Team Concert lets us capture and define requirements in records called artifacts. These artifacts have many special functions but one most important is the way each artifact history is tracked and maintained.

When we review and analyze our project information and explore requirements change or just want to know what has happened to a particular requirements we can access all prior revisions of the artifact to see what modifications have taken place (in red-line mark-up). We can discover when the change happened and when the change was made giving us important insight to the way the project will progress over time. The history of a requirement artifact also lets us restore any previous versions if a mistake was made or a change decision is reversed.

A bi directional traceability matrix will be maintained by the team which gives the mapping between requirement and all the deliverables spread across all the phases. This helps in ensuring all the requirements are addressed in the right form through the deliverables across all the phases leading to the complete solution. It is recommended to have the updated bi directional traceability matrix as a deliverable across all the phases.

vii. Describe the approach that will be followed for allocating computer hardware resources and monitoring their utilization;

Wipro/IBM has a dedicated IT Management Group (IMG) which is responsible for providing all computer hardware and support. The network and LAN/WAN teams are part of the IMG group. An expert analysis will be conducted by the IMG group to understand the hardware resources. Hardware resources will be allocated based on the outcome of the expert analysis and will be monitored by Wipro IMG group. Wipro IMG group has alliances with global partners and some of the key partners are CISCO, AVAYA, Juniper networks, Alvarion, ECI, ADVA, ARISTA, and HP to name a few.

viii. Describe the method to be followed for recording issues and information that will be useful for key decisions made during development activities;

The Issue Management Tool that will be used to document, track and manage issues and document issue resolutions is the IBM Rational team Concert. Issues will be logged in the weekly status report, logged into the issue tracking database by the members of each team, and reviewed weekly by the

project management team. The issue tracking database will be used to determine the status of outstanding issues and the resolution of closed issues. This will ensure that issues are resolved in a timely and accurate manner. IBM Rational team Concert will be used as an issue management tool. Issue resolution will be stored in IBM Rational team Concert. We can provide MLTC access to the tool over the Internet. As per license agreement with IBM we can provide review and approval access to customers for Issues documents.

A decision tracker will be maintained to track key decisions taken in the project. Quantitative decision making approach like the force field analysis will be used to arrive at the right decision. This will help in adopting a quantitative scientific approach rather than a perspective based approach.

ix. Describe the quality assurance methodology and activities that will be used to ensure adherence to design requirements;

Wipro has a dedicated Mission Quality group to help account deliver projects at the highest quality. The Quality assurance for any project in Wipro is divided into the following broad activities:

- Review and Inspection – Review on the documents/source code and outputs/deliverables
- Testing – Testing on the work product developed
- Test Audit – Verification on the testing.
- Metrics collection and analysis
- Defect prevention
- Reviews by Quality Improvement Council

Wipro's process automation tool e-Cube is used for ensuring that the projects executed at Wipro offshore centers are in compliance with its quality processes. Wipro uses the following techniques to assure quality of the deliverables:

Review and Inspection - Reviews and Inspections are performed to ensure that the items that are reviewed or inspected are complete, correct and fit for use. The process applies for both documents and code written. Wipro has implemented DRFT (Doing Right First Time) as part of its quality process. This is achieved by implementing effective reviews and inspection throughout the life cycle of the project.

All reviews are planned as part of the project plan. Wipro's QA procedures include the reviews performed by Peer Review team (PRT). Normally, PRT reviews are sought for all client deliverables. The concept of PRT reviews is implemented in Wipro to ensure validation of the quality of the deliverable by someone other than the author of the document / code.

Testing – To give more focus on Testing and defect management, Wipro has a dedicated Testing services practice which focuses on the various types of testing and has a trained team of qualified testers. Wipro follows a comprehensive approach for testing to make sure that the product developed meets the requirements. Testing is conducted at several levels during the project development life cycle. Some of the typical testing cycles that are conducted during development phase are Unit Testing, System and Integration testing, User Acceptance tests, and Performance testing.

* Errors/defects are classified as fatal/major/minor for severity. Defect logs are tracked and analyzed to identify and improve the weaker areas. Daily defect triage meetings have been implemented by Wipro in many projects with significant success.

Test Audit - Test audit is conducted for all the major deliverables of the project like design document, unit tested code etc. by an External Review team. The External Review team typically comprises of members who are not part of the project team. This helps to bring in an external perspective to ensure product quality.

Metrics Collection and Analysis – SEPG (Software Engineering Process Group) and Mission quality team are involved in the Quantitative analysis of metrics. All the metrics as defined for the project in accordance with the Wipro QMS (Velociq) are captured and analyzed. For development projects, Wipro captures and analyze metrics across Schedule, effort, defect density, phase containment, productivity to name a few. These metrics are analyzed every month through Ecube a tool used to capture metrics. The captured metrics will be analyzed through a metrics report called as PDMR (Project Data Metrics Report). The PDMR metrics are used to identify potential risks in the project and address them. The project progress and quality metrics are reported in monthly Project Status Report that is reviewed by the Delivery Manager with the Project Manager.

Defect Prevention - The purpose of the process is to prevent defects from recurring in the current and future project. Defect Prevention planning will be initiated when project metrics exceeds the specified norm. The following activities are carried out as part of Defect Prevention Plan:

- Analysis of Root Cause using 5 Why technique which is also called as Ishikawa diagram
- Preparation of Prevention Plan
- Review of the Prevention Plan
- Implementation of the Prevention Plan
- Sharing of the implementation across the Business Unit / Organization

Reviews by Quality Improvement Council - Quality Improvement Council constitute members drawn from cross functional groups of the development centers, led by Development Center Head, co-coordinated by Quality Manager. The implementation of the quality plan, audits, and reviews by senior management ensures the deliverables are of high quality.

x. Describe how developer performance will be monitored against defect tracking and the corrective measures taken to improve developer performance;

Effective defect management techniques play a key role in the testing life cycle. Wipro, as an organization, has achieved a Defect Removal Efficiency of 99.8% due to use of innovative techniques and procedures. Wipro will implement these techniques to identify, contain, and prevent defects occurring in later stages of the testing cycle.

Defect Management Process:

Wipro recommends following the 3-step process towards identifying and containing the defects early in the testing cycle.

- Early detection: This will be achieved by:
 - Involvement of the testing team early in the SDLC

- Reviews, Inspections and Audits
- Well-defined entry-exit criteria for each phase of testing which are termed as quality gates
- Phase Containment
- Defect Isolation: This will be achieved by:
 - Well-defined classification mechanism for the defects. The classification will be around:
 - Module / Functionality
 - Severity / Priority
 - Type of defect – UI, Interface, data etc
 - Environment and Sprint – on which the defect was identified
- Defect Prevention: This will be achieved by:
 - Six Sigma Techniques like DSSS that provide proven tools and techniques
 - Executing Lean projects by effective usage of required Lean tenets
 - Design of Experiments technique to optimize the Verification process

The progress of test activities and status shall be monitored and reported to the project management through the following channels:

- Daily Triage meetings during test execution for early visibility of defects and to prioritize the defects that arise out of the test phases
- Daily Dashboards
- Weekly Status Reports highlighting plan v/s actual for the previous week, plans for the current week, key issues and concerns, critical show stoppers etc.,
- Weekly Status Meetings to discuss the outcome of test phase and to agree on the plan for the subsequent week.

At the end of testing phase for each application pillar, a Test Summary Report shall be produced by the Onsite Test Lead outlining details on the outcome of the test phase including

- Test execution coverage
- Adherence to the exit criteria as documented in the test plan document.
- References to all the defects and issues found during the phases of testing

xi. Describe the process that will be used for the review and walk-thru of the source code;

Traditionally, review done by domain experts along with testing has been the way to ascertain software quality. However, this approach to software quality assurance is limited by the availability of testing resources and domain experts. With increasing computing power from improvements to hardware and consistent research, Static Code Analysis (SCA) has evolved to cater to the serious needs of software quality assurance.

The Code Review (CR) Practice is focused on inspection of software at the source code level in order to find security vulnerabilities. Code-level vulnerabilities are generally simple to understand conceptually, but even informed developers can easily make mistakes that leave software open to potential compromise. To begin, an organization uses lightweight checklists and for efficiency, only

inspects the most critical software modules. However, as an organization evolves it uses automation technology to dramatically improve coverage and efficacy of code review activities. Sophisticated provision of this Practice involves deeper integration of code review into the development process to enable project teams to find problems earlier. This also enables organizations to better audit and set expectations for code review findings before releases can be made.

DeepCheck is Wipro's answer to software quality assurance needs. With its strong analysis capabilities DeepCheck can look deep into the source code and dig out programming bugs that are detrimental to runtime behavior. With its low False Positive rate, ease of integration and strong OS and other platform abstraction capabilities, DeepCheck comes handy in developing defect proof software.

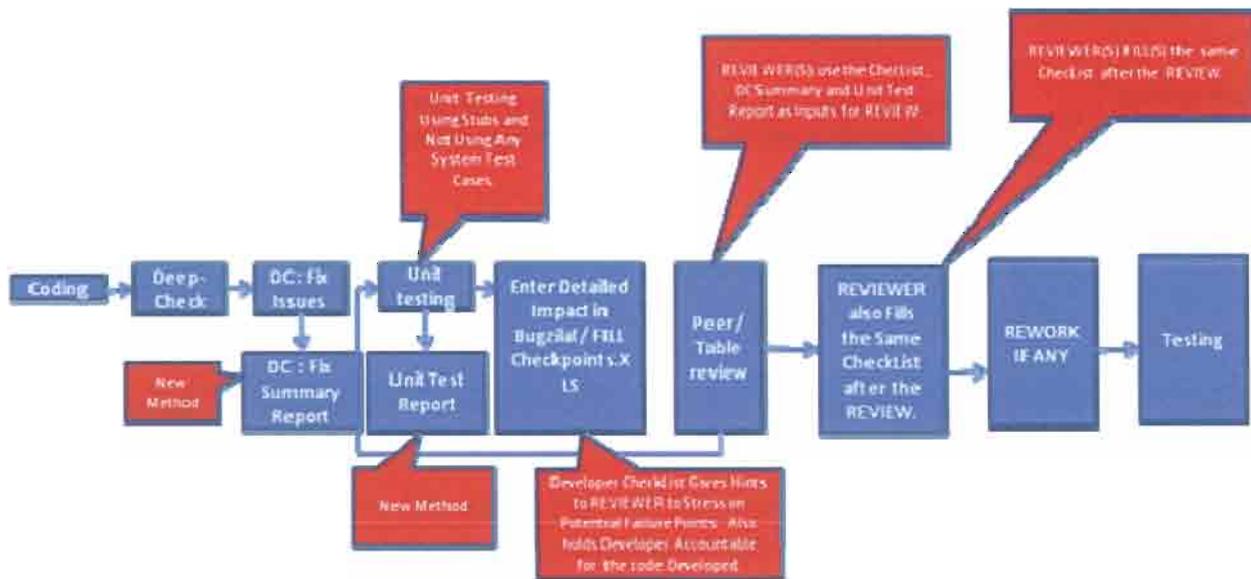

Figure IV-116: DeepCheck

xii. Describe how the tool(s) will be configured and assist in the system development tasks.

We propose to use below tools during system development phase:

- Life Ray portal – Portal development, Single Sign-on
- Rational Quality Management – Quality management, assurance and control
- IBM Rational team Connect – Communication, Change Management, Configuration Management
- MS Project Professional – Project Management
- Adobe Acrobat XI – Design document production

15. Testing

Wipro Testing Service – Industry Leader

Wipro has been offering Independent Testing and Validation for over 16 years, starting in 1997 and is one of the largest testing service providers for the last 10+ years. We have 280+ Clients and 9500+

Strong Testing Professionals. Wipro has been rated highly by leading Analyst across the globe. Some of the views shared by analyst are as given below.

Figure IV-117: Views of Wipro as a Testing Provider

Case in Point

End to end QA of Membership Management system and claims processing system for an American drug manufacturing company

- Defined an end to end test strategy and Test Plan for Membership enrollment system
- Created Membership registration and enrollment process maps and developed reusable test scenarios
- Developed point/business solutions for membership enrollment, claims processing, Mail order and specialty pharmacy

Benefits:

- 100% delivery on time.
- Delivered 99% of the projects with zero functional defect slippage
- 30 % effort savings realized by implementing best point solutions.

Wipro Differentiator and Innovations mapped to Value for MLTC ESS Solution

Methodology - Wipro Way of Testing

Wipro would adopt Shift Left Methodology which has been rated as #1 by Gartner for testing of ESS system. Shift Left Methodology approach helps phase containment of defects through early Involvement of Wipro testing team in SDLC. In order to reduce the defect slippage into production, we believe that there is need for a 'Left Shift' of QA engagement and participation in the early days of a program, rather than the status quo approach of QA engagement later in the SDLC. The

upstream involvement of Testing Business Analyst/Quality Analyst (BA/QA) from the planning phase injects business process knowledge into the testing lifecycle for enhanced test coverage and Business Assurance.

IBM Testing Tool Suite

Wipro has alliances with leading Testing tool Vendors in the market including IBM rational tool suggested for this engagement. Wipro would be able to leverage its relationship to provide cost benefits and testing tool expertise which is necessary for this kind of complex engagement with multiple testing types, complex environments, and Test Data Security.

Wip-DVA for Data Centric Testing

For Data Centric Testing Wipro will utilize its in house developed tools Wip-DVA. Given below are some of the highlights of the tool

- Data validation tool WipDVA for automated test case generation, SQL scripting and test execution
- Benefits include effort reduction by 30%, faster time to market, data integrity and accuracy, standardization driving reusability and consistency
- Wip-DVA would support complex ESS system environment with different transaction systems, different warehouse systems, custom transformation, reusability challenges etc.
- It is a web based Secured application, login IDs will be created for the user as required on need basis.

Accelerators

End-to-End Lifecycle Automation and Easy Automate accelerator

Wipro's Easy Automate accelerator is a script-less reusable Automation framework which helps to 'quick start' automation. It addresses the challenge of maintenance of automation scripts by leveraging the concept of Abstraction and late binding to physical objects in the Object Repository. Faster script creation, minimal scripting and less trouble shooting increases productivity and results in faster automation ROI.

Wipro's innovative tools and accelerators throughout testing Lifecycle

Wipro has a dedicated Centre of Excellence lab to reach and develop tool/utilities that support every levels of the Software Testing Life Cycle – starting from the Test Design phase to the Test Execution Phase. Following are few of the innovation solutions in lined with Test optimization.

- StORM tools (Test Suite Optimizer [TSO]) - Test Suite Optimizer is a Systematic and statistical tool that allows creating a method of pair-wise combinations of factors across different levels. This creates an optimized effective test suite by eliminating the redundant test cases. This test suite increases the confidence of the testing activity as it uncovers most of the bugs of the system
- CoDeC tools (DSM, SCE, SCIM) - Wipro Codec tool is a collection of Wipro in-house tools and utilities (Dependency Structure Matrix (DSM), System Complexity Estimator (SCE)

and System Change Impact Matrix Analysis (SCIM)) to support the test optimization activities like Test Sequencing, Effort Estimation etc

- Defect Flow Analysis (DFA) - Wipro in-house DFA- Defect Flow Analysis tool helps in capturing the test results and bringing in standardization and uniformity in analysis and reporting of test bed data. It provides a graphical/tabular representation of defects and cumulative trends, test case productivity, pass/fail efficiency. Analysis of these Test bed data helps to determine the quality of the product or release by predicting the number of residual defects in the system. DFA also approximates the effort required to uncover the defects in the system. Tool is built on mathematical proven reliability prediction models and uses regression analysis for simulating trend patterns and predicting residual defects.

Test Business Process Pack for Enrollment Process

Wipro has invested in developing and building Business Test Process Packs for Enrollment Process Based on our experience from various engagements key Business process flows has been identified and Modeled for Enrollment process. These Business process packs help the testing delivery teams to achieve faster time to market, enhanced productivity, and knowledge management. Test process packs cover end-to-end functional coverage test cases for common business functions and can be easily customized for customer specific requirements.

- i. Describe the Contractor's proposed methodology for executing the nine (9) required types of testing (Unit, Integration, System Integration, User Acceptance, Stress/ Performance, Regression, System Recovery, Parallel, and Network Intrusion,);

Given below is Wipro's Testing Methodology.

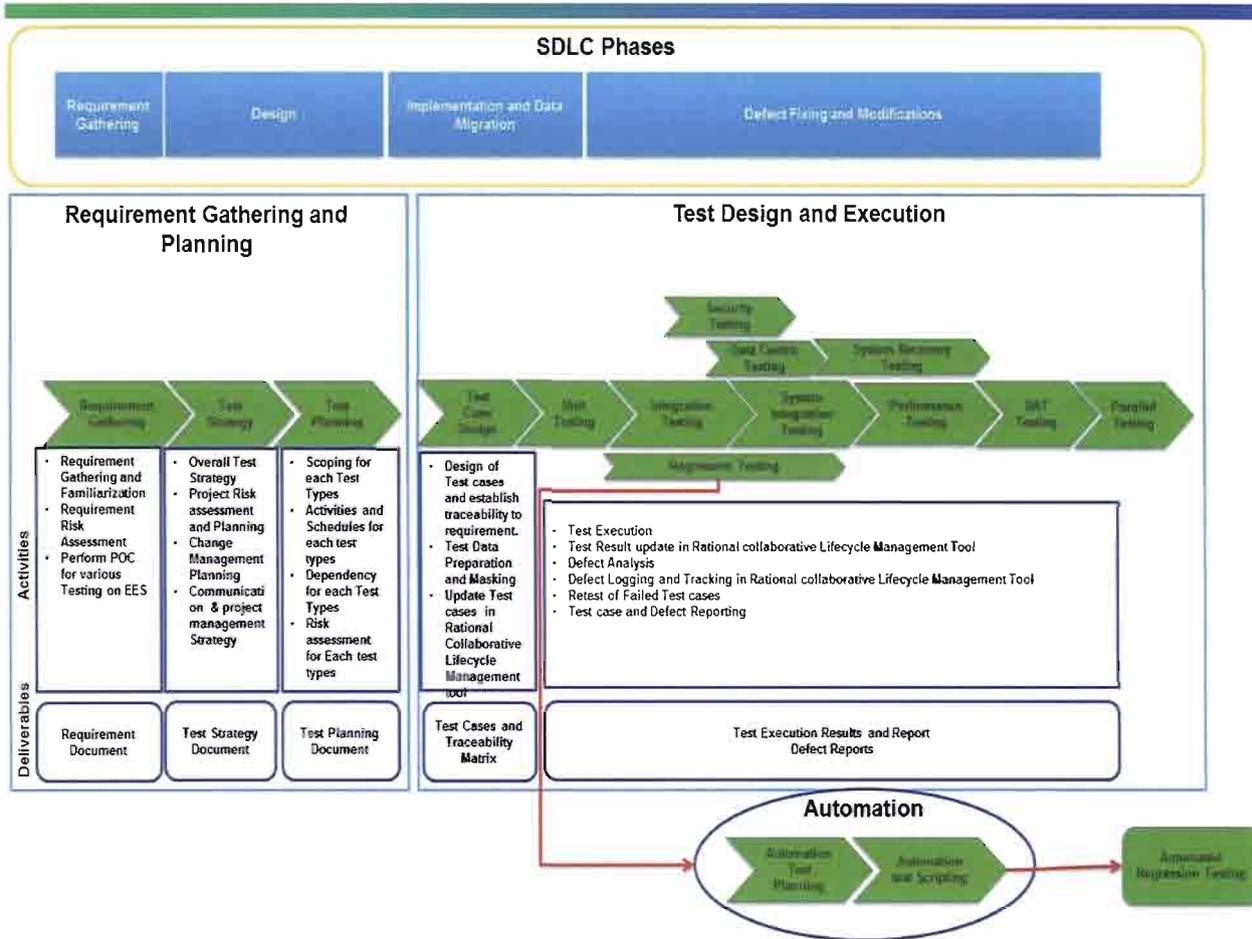

Figure IV-118: Wipro's Testing Methodology

Unit Testing

Objective

Unit testing is conducted to ensure that proper functionality and agreed coverage has been achieved during coding. Testing will be conducted by the developers and will focus on verification of their module of code developed for ESB services.

This phase will be totally owned and driven by the development teams across locations or in house depending on the arrangement of that project or program.

Unit testing will consist of the initial segregated testing of individual Components at Middleware and Integration Layer

Scope

Unit Testing will consist of testing the following Components

- **SmartPro MedEE** Functional Testing
- Rules Engine Services Testing
- Integration Layer Services Testing

Approach

The contractor will provide a Test Plan to include the detailed approach to be taken, to fully test all developed components of the system. The plan will include:

- Unit Test Phase and Objectives
- Entrance Criteria for the Unit Test Phase
- Exit Criteria for the Unit Test Phase
- Key milestones associated with Unit Test Phase:
 - Test Case Approval
 - Test Environment Readiness
 - Test Start and End dates
 - Code Baseline Configuration Established
 - Required Approval Dates for Test Cases, Entrance and Exit Criteria, etc.

Integration Testing

Given below is a high-level approach for Integration Testing.

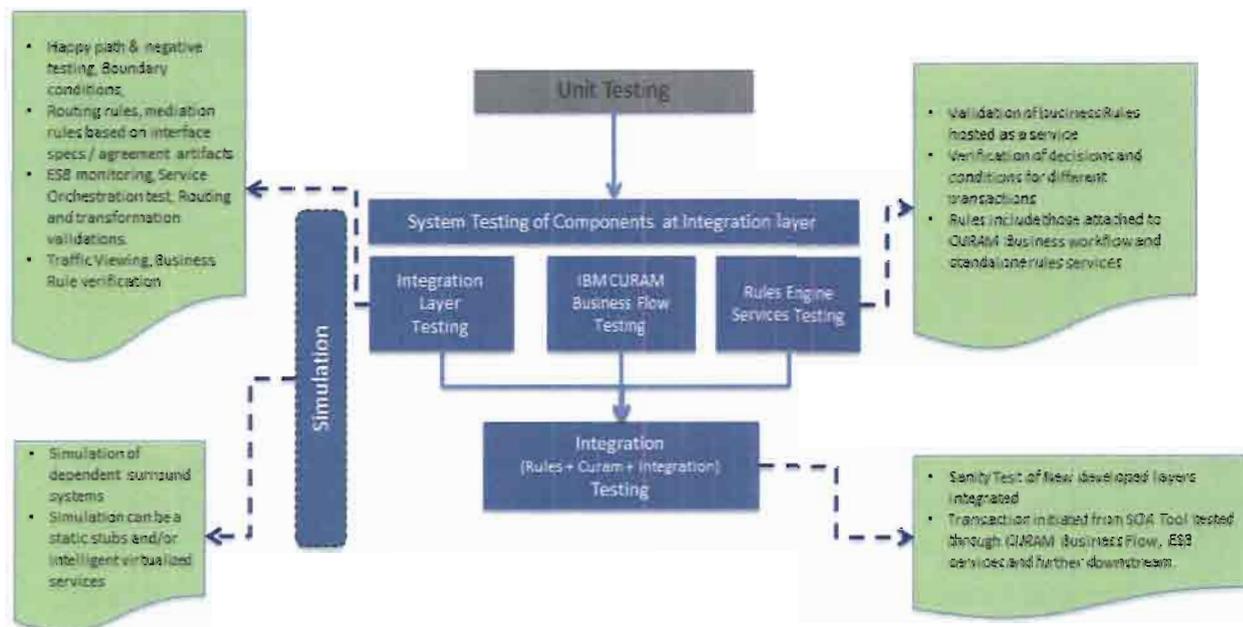

Figure IV-119: Integration Testing Approach

Integration testing will consist of the following Phases of testing

- System Testing of individual Components at Middleware and Integration Layer
- Integration Testing between different Components

System Testing of Individual Components at Middleware and Integration Layer

System Testing will consist of testing the following Components at Integration layer

- *SmartPro MedEE* Business System Testing
- Rules Engine Services System Testing
- Integration Layer Services System Testing

SmartPro MedEE Business System Testing:

Objective

System Testing Phase to validate and verify Business Process and/or Business Rules Management which delivers business workflows comprising processes, decisions, activities, and rules. This BPM/BRMS component of the middleware is the *SmartPro MedEE* capable of orchestrating multiple services in the landscape required for the success of the business operations initiated by the consumers.

Some of the specific objectives are

- Validation of Processes and its associated sub processes
- Validation of Manual Processes part of the overall workflow
- Validation rules, decisions and conditions

Approach

Business Process Management (BPM) is a process in which the business processes are aligned towards customer service expectation. This is well-planned and modeled end-to-end process orchestration of a complete customer service process. In this case *SmartPro MedEE* holds the business workflow for various processes.

Business Process Testing is performed in different test phases based on the complexity, constraints, dependencies, and challenges during the early phases of implementation. This Testing can be performed in three different phases/levels of testing as mentioned below in the picture.

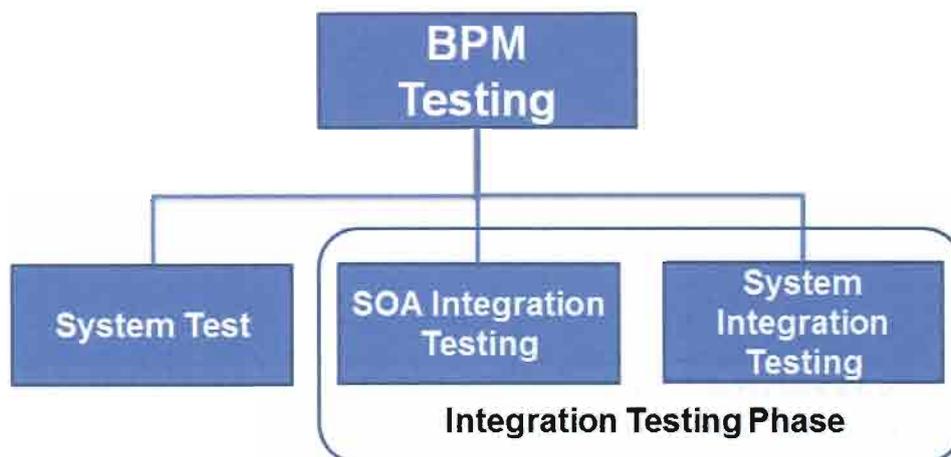

Figure IV-120: Business Process Testing Phases

Choosing the appropriate phase to test the Business Process will be a decision made by the SOA Test team post the analysis of the size, complexity, surround systems dependencies, and other environment challenges.

In System Testing we expect a medium to simple processes with limited constraints or dependencies which can be created in quick time in the test environments. With that assumption the following is the topology of a System Testing in a Test Environment.

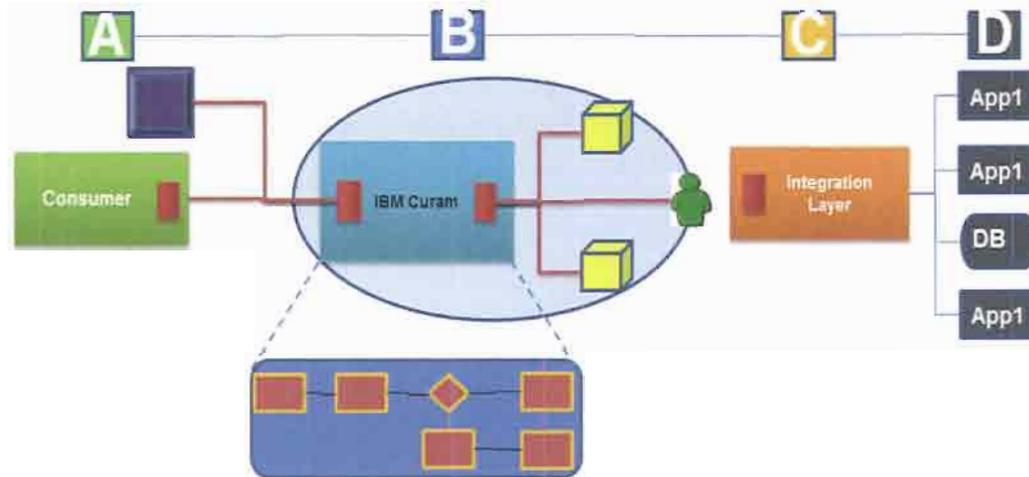

Figure IV-121: System Testing Topology

Initiating System/Consumers [A]

As an initiating system for a *SmartPro MedEE* business processes system testing it can be the SOA Testing Tool client and/or the Consumer User Interface as well.

It is a challenge to generalize a *SmartPro MedEE* Business Processes System Testing to particular format and it is very much project or enterprise specific. Considering this section is about generic ways of testing a BPM, the providers services have been represented to cover all those touch points possible in a System Test on a Test Environment.

Rules Engine Services System Testing

This is commonly referred to as Web Services Testing in a SOA testing world, however in this document we have referred to this as a Services System Testing, representing the validation of the Rules Engine as a service.

Objective:

- Verification and Validation of the rules engine services
- Testing of composite and atomic rules hosted on the rules engine
- To flush out early defects in the list of rules
- Validate custom error code and exceptions

Scope:

The scope of services testing is the rules exposed as Services exposed to other systems within MLTC infrastructure. These are the services apart from those rules attached to *SmartPro MedEE*.

Approach:

The general approach towards testing services is applicable in this case. The services are tested using an SOA Test Tool Client initiating the request messages into the provider service.

Provider service will work on the request message and get in touch with further downstream systems if any and get back to the SOA Test Tool Client with a response. The response message is automatically validated against an expected result configured in the SOA Test Tool.

Integration Layer Services System Testing:

ESB Services System Testing (Integration Layer Services)

Objectives

- To verify and validate the functional and technical requirements of the Integration layer services
- Test various configured features and properties of the middleware in specific detail
- To flush out early defects with specific configuration and changes implemented
- Creation of Simulated Services using a recognized tools
- Validation of transformation, routing, aggregation features of the Message Broker and B2B Gateway specific to individual transactions or business flow
- Validation and conformance of all regulatory transactions against a Simulated Services

Scope

The Integration Layer services will cover the following components

- IBM WSRR
- IBM Web sphere Message Broker
- IBM Sterling Direct Connect
- HIPAA Transformation Extender

Approach

The following is the middleware System Test topology that will be in use during the system testing. System testing of an Integration Layer will involve the following in a test environment:

- SOA Test Tool - Initiating *SmartPro MedEE* Inbound Transactions
- Message Broker or WTX System under Test
- Downstream Service Simulation – Virtualized Provider Services

The same type of test environment will be used for Isolated Performance Testing. This is under the assumption that the environment has the capacity planned to host a limited performance testing.

Integration Testing between Different Components

The high-level expectation of this phase is to test the layers built to support SOA brought together for the first time. This validation will certify the Test Environments and limited integrated layers which will be used for End-to-End System Integration Testing.

Objective

- Validate the first time integration of layers which has undergone change and impact
- Shakedown tests when integrating the Integrated Layer, *SmartPro MedEE*, Rules Engine, downstream Service Layer and other surround services
- Exhaustive End to End Business Process Testing which is *SmartPro MedEE* and Rules Engine
- To flush out early defects during integration
- Validation of Integration scenarios below consumers with real surround and third party systems. Any service or application availability constraints will be Simulated but will be kept at minimal Basic Orchestration for selected popular business flow
- Service Versioning and Discovery

The below is the test topology of the SOA Integration Testing which is about testing the integration of Middleware components with provider services and other surround systems.

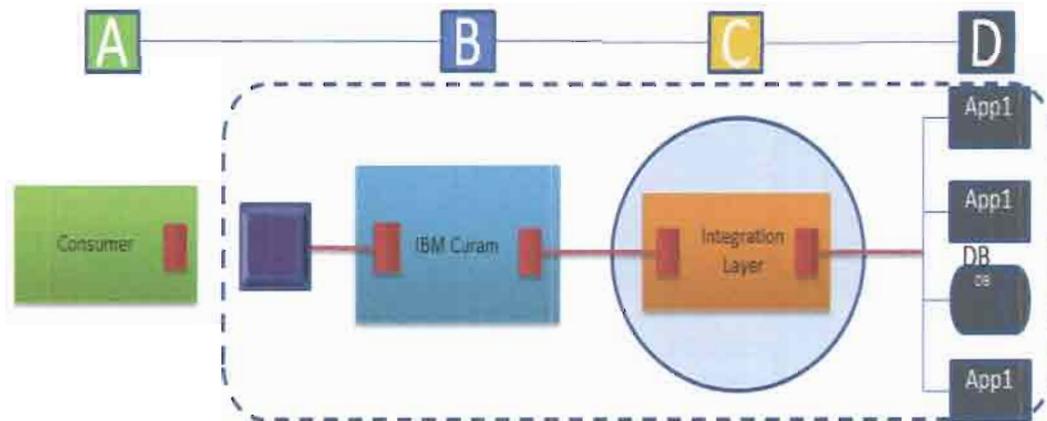

Figure IV-122: SOA Integration Testing Topology

Consumer [A]

This phase would have a SOA Test Tool Client replacing the consumer front end systems which would reuse the test suite prepared from the System Test Phase to be re-executed in the this new Test Environment integrated for the first time recreating the SOA Platform.

Curam [B]

This is the *SmartPro MedEE* and Rule Engine component which is under test that will be integrated for the first time post the change with the downstream services and third party applications.

Integration Layer [C]

These are services hosted by the Message Broker, IBM Sterling Direct Connect, and Transformation Extender.

Host Systems [D]

The internal and external host provider systems delivering the services required to complete the workflow.

System Integration Testing:

Approach

System Integration Testing will involve functional and End-to-End business scenario testing. There will be two cycles of SIT execution:

- Cycle 1: Will include testing the functionality of the initial code drop; any defects identified will be raised and assigned to the development team
- Cycle 2: Will include testing defect fixes and any functionality marked for the iteration that was not released in the first code drop

Overview of the key functionalities which will be tested as part of System Integration Testing

Figure IV-123: System Integration Testing Key Functionalities

System Integration Testing will involve testing of all the functionalities listed above and also End-to-End Business Process Workflows cutting across multiple modules.

The following approach will be followed as part of System Integration Testing:

- Wipro will work with MLTC SMEs to understand and Identify End to End business processes.
- Wipro will analyze the existing resources for E2E testing like Stubs, Integrated System etc

- Wipro will prepare a System Integration test plan, where all the business process that will be tested as part of E2E testing.

All upstream systems and downstream systems integration points will be tested.

User Acceptance Testing:

As part of User Acceptance testing, MLTC Business users will perform testing of whole system and validate it against expected result from Business aspect as well as from usability front. UAT happens after completing the SIT and Performance testing. It is carried out in UAT environment or environment which resembles the production environment.

For ESS system UAT testing, Wipro test team will perform below activities:

- Identify the test scenarios for UAT
- Prepare the acceptance test cases
- Review test cases
- Get approval from Business users regarding the coverage
- During Execution Test team will support the Business users

Performance Testing:

The following are details of the Performance Testing approach for proposed solution for MLTC requirement specific to Medicaid Eligibility and Enrollment (E&E) System with a modern COTS-based Eligibility and Enrollment Solution (*SmartPro MedEE*). Wipro proposes performance testing for the most critical and highly accessed scenarios.

Table IV-28: Performance Testing Considerations

Consideration	Description
Wipro has considered the following number of scenarios	Web\Web Services Based – 30 critical scenarios from Web\Web Services protocol (http\html) of IBM Rational Performance Tester with various roles available i.e. Citizens, Employ <i>SmartPro MedEE</i> , Case Workers, Analyst or Program Staff
Wipro performance test team will design\develop performance test scenarios in IBM RPT.	The critical scenario selection will be depended on High Volume, Complexity, and Business\Service Impact

Wipro along with Implementation team for MLTC SMEs will identify the business critical scenarios\work flows\Internet flows\ application navigation etc (for which the performance test scripts will be created). The identified and critical scenarios will be automated and scripts will be generated using the Automated Performance Test Tool IBM RPT. The RPT Tool helps in designing scenarios and simulation of users as per the test scripts and workload. Subsequent step of test execution (with sanity check) ensures the Performance Benchmark is achieved as per SLAs and other execution of another set of high load tests for identification of Performance Bottlenecks

Performance test team will follow incremental-iterative model, whereby, in different cycles, users will be increased with the corresponding data. The main outcome and objective at the end of this

testing is to verify overall system behavior and end user experience under varied load, system resource utilization, compliance with defined SLA as per page complexity, performance bottleneck identification and room for performance improvements. The objective is also to establish performance baseline.

Types of performance testing

Based on the understanding of the user requirements and identified performance test scenarios, Wipro would define the level of performance testing required to be executed for proposed solution. Given below are various types of typical performance tests that are usually considered.

Table IV-29: Type Performance Tests

Test Type	Performance Objective Addressed
Benchmark	Provides benchmarks of the performance of the Applications and compare with previous performance testing benchmark
Performance	Measures the end user response time under varying load conditions and reliability of the function\system being exercised under load
Load	Determine whether the system will be able to handle and exhibit consistently the required performance characteristics Evaluate whether system capacity meets the performance characteristics under normal and peak load and futuristic usage conditions
Stress	To identify the optimum configuration for a specific application\system
Endurance	To identify memory issues etc that occur during continuous usage of system over prolonged time duration

Performance Test Monitoring

All the hardware server resources and software resources should be monitored for various metrics (Transaction Response Time, Transactions per Second (TPS), Throughput, CPU Utilization, Memory Utilization, and Database etc.) during the test with the support from application team, environment teams. This would help to record performance benchmarks and identify performance bottlenecks.

Performance Testing Methodology

Wipro shall use its proven End-to-End performance testing methodology as shown in the below figure for carrying out performance testing for MLTC. The overall approach will be implemented in 4 phases as depicted pictorially and explained below. Sub-phases, activities and deliverables in each of these phases are also given in the same diagram. Details of the phases are given in the table below.

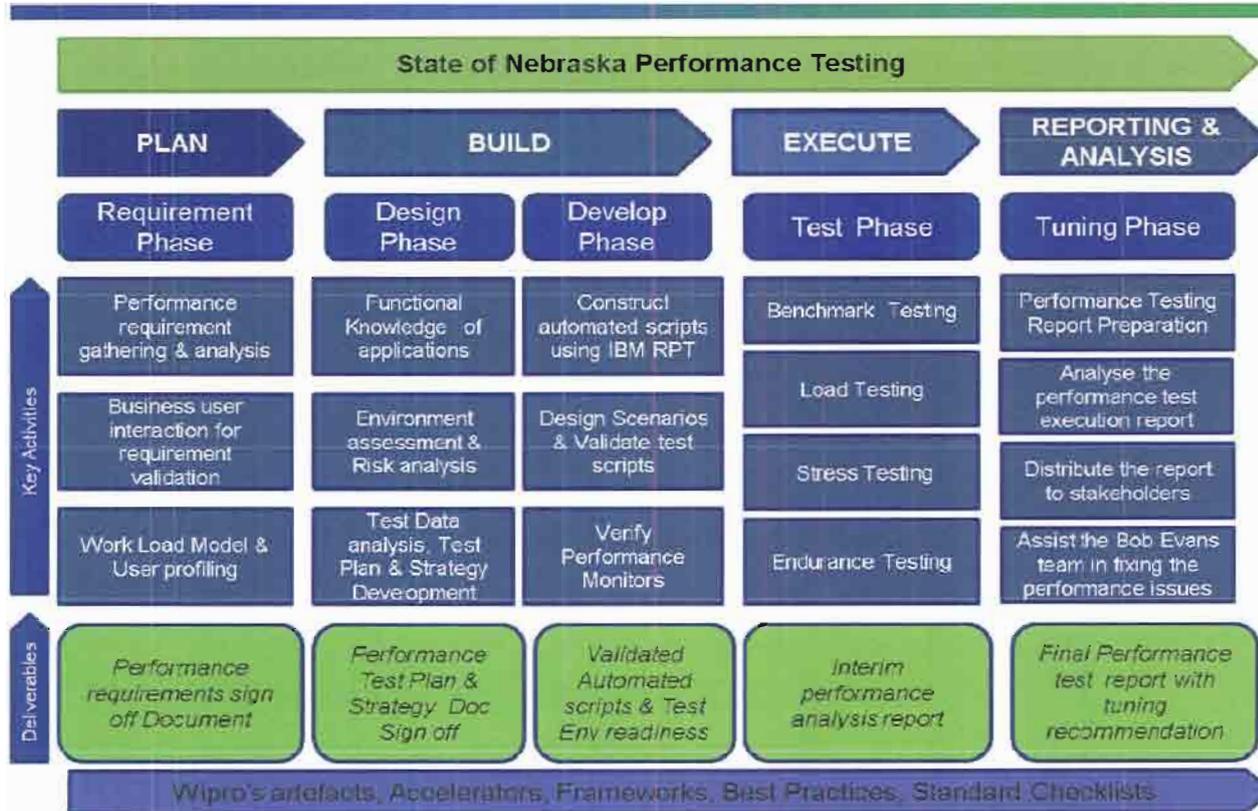

Figure IV-124: Performance Testing Methodology

Table IV-30: Performance Testing Methodology Details

Phase(s)	Activities
Requirement and Design	<p>Study of the business scenarios, finalization of the business scenarios and load distribution</p> <p>Finalize performance test requirements and functional knowledge acquisition of EBS processes in scope</p> <p>Understanding work load model and user profile</p> <p>Creation of Performance Test plan and sign off from MLTC</p>
Develop and Test	<p>Test Scripts will be developed based on the performance test scenarios</p> <p>Script enhancement will be carried out by using parameterization with test data</p> <p>Test bed that is same \ similar to production environment will be validated by Wipro performance testing team. Wipro will need Production sized database to be made available during this phase</p> <p>Test data will be created and validated by Wipro against each business function requirement and dependency between business functions</p> <p>Help Setting up performance monitors on MLTC servers</p> <p>Dry runs to ensure the scripts are working fine with all the business functions</p> <p>Execution of test scenarios for various types of tests such as load, stress, endurance.</p> <p>Analysis of performance test reports</p>
Analysis and Tuning	<p>Monitor and gather the performance test results for analysis</p> <p>Analysis of performance test results to identify the bottlenecks and measure against Business goals</p>

Phase(s)	Activities
	Defect reporting and Suggestions to improve the application performance Test scripts, scenarios, results, reports and log files will be managed and archived for future use At the end of this phase, Wipro will submit final test completion report to MLTC stakeholders' highlighting the overall performance test report with performance tuning and recommendations

Regression Testing Manual

Regression testing will be carried out to ensure that the existing functionality is not affected by any new functionality added/ code changes/ bug Fixes or releases. Critical test cases will be leveraged from System and System Integration test cases. The test cases for regression testing will be selected based on

- Business Critical Scenarios: Business Critical scenario would consist of test cases which are most critical for Daily running of Business for example User Profile management etc.
- Transactional Critical Scenarios: Transactional critical scenarios would consist of scenarios where transactions are critical like Report validation, workflow management etc.
- Risk Based Scenarios: Risk based scenarios will consist of scenarios which would emphasis on the changes on the UI and the impact it could create on a particular functionality for example verifying the functionality works as expected if a multiple list elements is changed to a Dropdown box.

Regression Testing Automation

Given below is the proposed Automation approach for Automation testing:

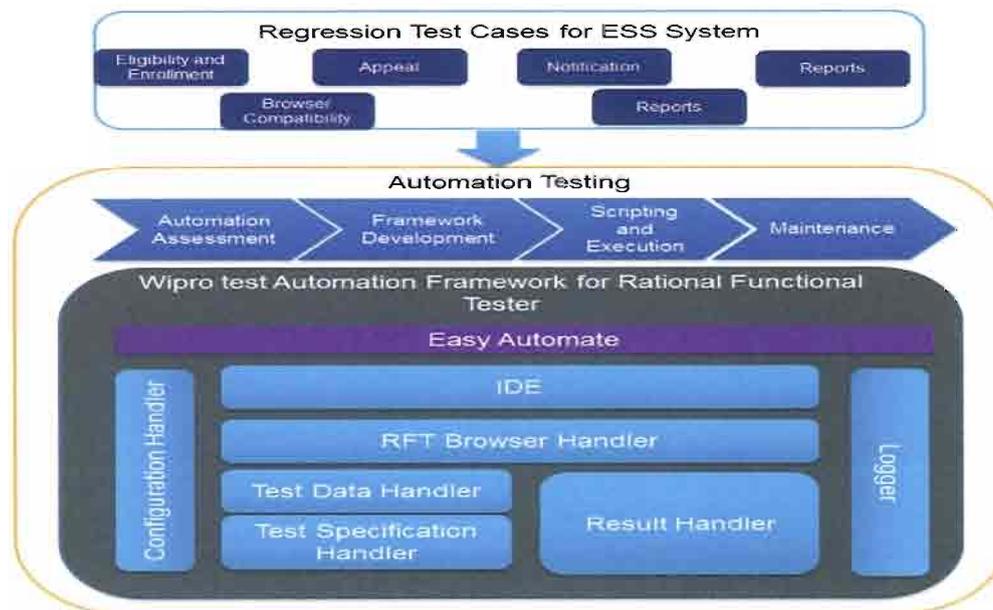

Figure IV-125: Automation Approach

Strategy for automation of test cases for Regression test suite can be described in a four-phased approach:

1. Automation Assessment
2. Framework design and development
3. Scripting and execution
4. Maintenance

In this approach, the automation assessment would determine how the automation is taken up for the *SmartPro MedEE* system. The automation assessment covers the automation readiness of all the modules in the application and assessment of Easy Automate on *SmartPro MedEE* system. The framework design and development follows the assessment phase. Reusable functions and actions are scripted into a library for reuse. The traditional scripting and execution is the next phase. This is then followed by ongoing maintenance of scripts.

In this strategy, the critical success factors are:

- Development of framework for scalability, performance and reusability
- High degree of reusability and productivity for better return on investment

System Recovery Testing

Objective

To ensure that the implemented business solution will be capable of recovering and being restored from an unexpected disastrous termination.

Approach

This activity requires the development of a Contingency Planning and a Disaster Recovery plan that defines procedures and processes throughout the life of the contract. This will require the development of:

- Contingency Plan
- Disaster Recovery Plan

Network Intrusion Testing: Security team:

IBM Security Network Intrusion Prevention System

IBM Security Network Intrusion Prevention System appliances are designed to stop constantly evolving threats before they impact your business.

IBM Security Network Intrusion Prevention System:

- Achieve unmatched levels of performance without compromising breadth and depth of security
 - Protect business-critical assets—such as networks, servers, endpoints and applications—from malicious threats
 - Reduce cost and complexity by consolidating point solutions and integrating with other security tools
 - Gain advanced threat protection, powered by the IBM® X-Force® research and development team
- ii. Describe the tool that will be used by the Contractor, the rationale used to select the product and how the State of Nebraska will have access to it;

Wipro plans to use the following test tools for the engagement:

Table IV-31: Test Tools

Tools Used	Rationale
Rational Collaborative Lifecycle Management Tool	Rational Collaborative Lifecycle Management tool is a single platform End-to-End Software lifecycle management tool. It features Requirement Management, Test Management, Defect Management, and Reporting modules under a single umbrella providing 100% traceability between Requirement, Test cases, and Defects. Wipro propose to use IBM tools suite as the tools suite will provide seamless compatibility with SmartPro MedEE solution additionally Wipro will also be able to provide Cost benefits through Wipro/IBM alliance and Wipro accelerators.
Rational Functional Tester	Rational Functional tester would assist in Quick generation and execution of automated test scripts. Due to its Strong Framework and Object Oriented nature RFT is ideal to script in complex environment with multiple integrations and complex business workflows. Wipro would also be able to provide Cost and Effort benefits to MLTC by using various In house developed Frameworks, accelerators, and tools built on top of RFT. With implementation across 60 customer projects, we have seen good success with these Frameworks, tools, and accelerators.
Rational Performance Tester(RPT)	RPT will provide automated performance testing capabilities to validate the scalability of web and server based applications. It supports load testing against a broad base of applications such as HTTP, SAP, Siebel, SIP, TCP Socket, and Citrix. The following key features makes the tool of choice for the engagement: Rational Performance Tester goes beyond problem identification to problem diagnosis Integrated Resource Monitoring Run large multi-user tests with limited hardware Automatic identification of, and correlation of dynamic server responses Rendered HTML view of Web pages visited during test recording Java code insertion for flexible test customization Entrust security protocol support
Rational Integration Tester and Rational Virtualization Server	Rational Integration and Rational Virtualization Server would assist in Reduce dependency on UI availability Built in editors to create structured messages/requests Multi-protocol and native platform support Non-invasive invocation, multi-layer verification and validation

Tools Used	Rationale
	<p>Test automation Stub creation and service simulation</p> <p>The recommendation is based on the overall technology stack and larger IBM platform presence both in Business and integration layers of the SmartPro MedEE solution. Rational Tool Product can integrate and interlock with various IBM integration platform products and technologies that are implemented as part of this product. In addition, the existing testing toolset being Rational it is appropriate to bring in the Rational integration tester to seamlessly integrate in to the existing tool chain with minimum disruption.</p>
Wip-DVA (Wipro In House Tool)	<p>WipDVA is a Data validation tool used for automating test case generation, SQL scripting and test execution</p> <p>Benefits include effort reduction by 30%, faster time to market, data integrity and accuracy, standardization driving reusability and consistency</p> <p>Wip-DVA will support complex ESS system environment with different transaction systems, different warehouse systems, custom transformation, reusability challenges etc.</p> <p>It is a web based Secured application, login IDs will be created for the user as required on need basis.</p>

MLTC will be able to access the tools by using the infrastructure where hosting of these tools will be done.

iv. Describe the tool that will be used for the automatic generation of test transactions;

Wipro will use the following tools to automate test transactions:

RFT: Rational Functional Tester

IBM Rational Functional Tester is an automated functional testing and regression testing tool. This software provides automated testing capabilities for functional, regression, GUI, and data-driven testing. Rational Functional Tester provides the following Feature Benefits

- Storyboard testing: Simplifies test visualization and editing using natural language and rendered screenshots.
- Automated testing: Enables testers to automate tests resilient to frequent application user interface changes with Script Assure technology.
- Data-driven testing: Lets you perform the same series of test actions with a varying set of test data.
- Test scripting: Combines a recorder of user actions with multiple customization options and intelligent script maintenance capabilities.
- Integrations: Integrates with IBM Rational team Concert and IBM Rational Quality Manager to provide access to work items and logical or compound SCM test asset support

RPT: Rational Performance Tester

IBM Rational Performance Tester is a performance testing solution that validates the scalability of web and server applications. Rational Performance Tester identifies the presence and cause of system performance bottlenecks and reduces load testing complexity.

Rational Performance Tester helps you quickly execute performance tests that analyze the impact of load on your applications.

- Code-free testing enables you to create test scripts without programming.
- Root cause analysis tools find and diagnose the cause of performance problems.
- Real-time reporting enables immediate recognition of performance problems and renders a browser-like view of test results in web pages.
- Test data can be generated from scripts, data pools with automated variation, and the insertion of custom Java® code for flexible test customization.
- Load testing helps ensure applications are able to handle large user loads prior to deployment.

Rational Virtualization Server and Rational Integration Tester

IBM Rational Test Virtualization Server allows you to use virtual services developed in Rational Integration Tester to create, share, and deploy virtualized test environments.

IBM Rational Integration Tester (RIT) is integration testing and application (service) virtualization too. RIT is part of the Rational Test Workbench offering and it enables

- Continuous Integration Testing
- Test virtualization

Wip-DVA

Wip-DVA is an In house tool developed by Wipro. The objective of this tool is to automate to maximum extent the tasks involved in the testing / quality assurance of data warehouse and migration projects. It would assist in addressing/ resolving the following business problems and challenges:-

- Business Challenges
 - Small Cut over windows for new application go-live
 - No possibility of feedback mechanisms -One chance at correcting data quality
 - Migration Performance and Scalability
- Data Challenges
 - Complexity of Target Data Structures and data flow
 - Data Volume, Data Quality and Integrity
 - Transformation Complexity
 - Data Latency, Loss of data

iii. Describe to what extent the tool being proposed will automate the testing process;

Please refer the below diagram that describes the percentage of automation that can be done for the testing processes:

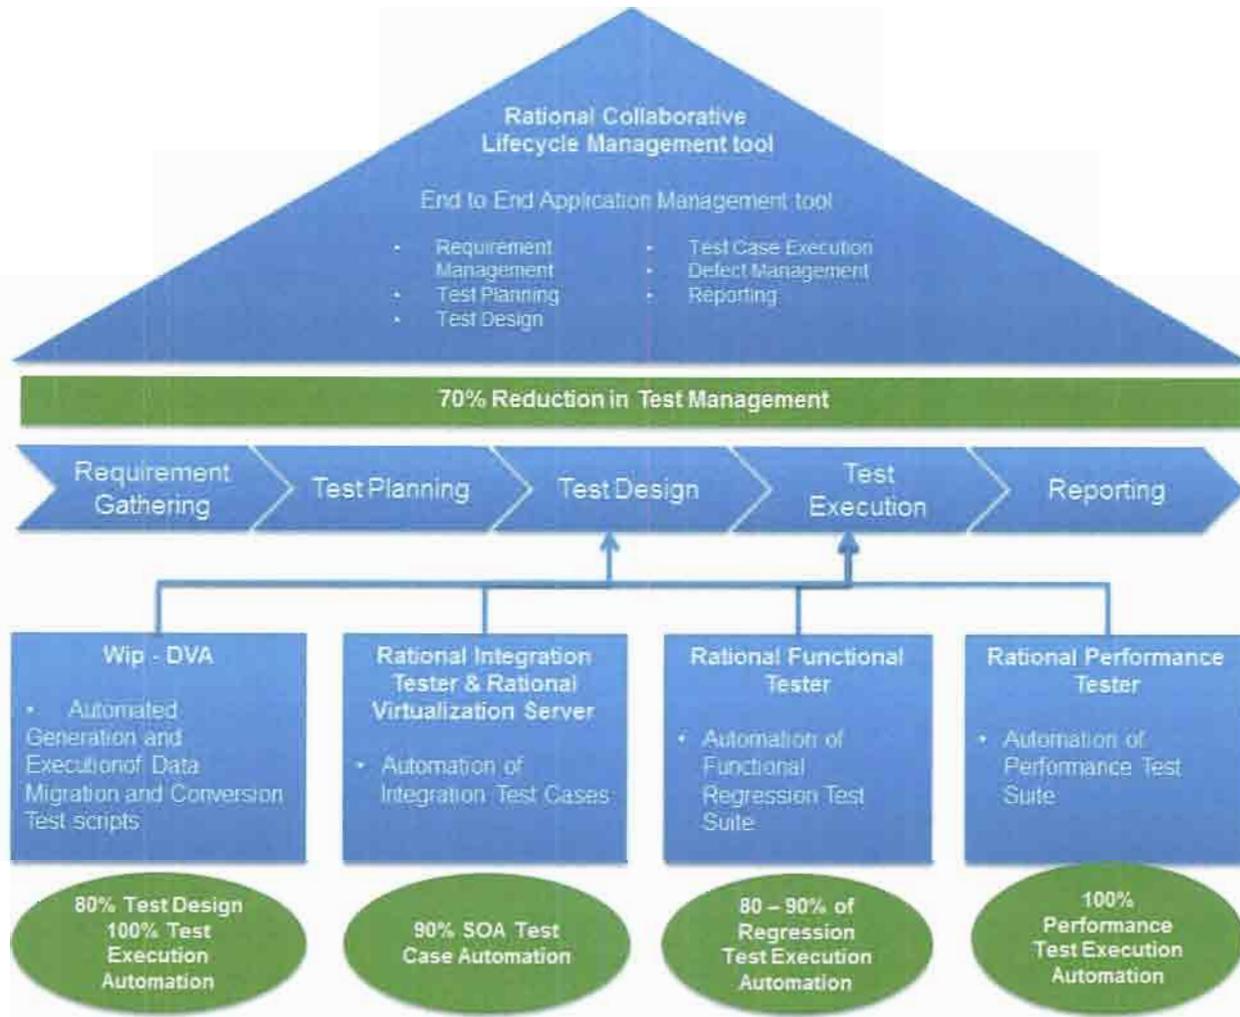

Figure IV-126: Automation Roadmap in Testing Lifecycle

Rational Collaborative Lifecycle management tool provides platform from requirement management to test management. Test plan will be linked to releases and test cases will be linked to each of the requirements. Tool also helps in ensuring 100% traceability. During the test execution in case if the test fails, tool provides an option to raise defects and it creates automated traceability.

v. Describe how test cases and test scripts will be tied back to requirements;

The test cases and test scripts will be tied back to the requirements with the help of Rational Quality manager as depicted in the diagram below:

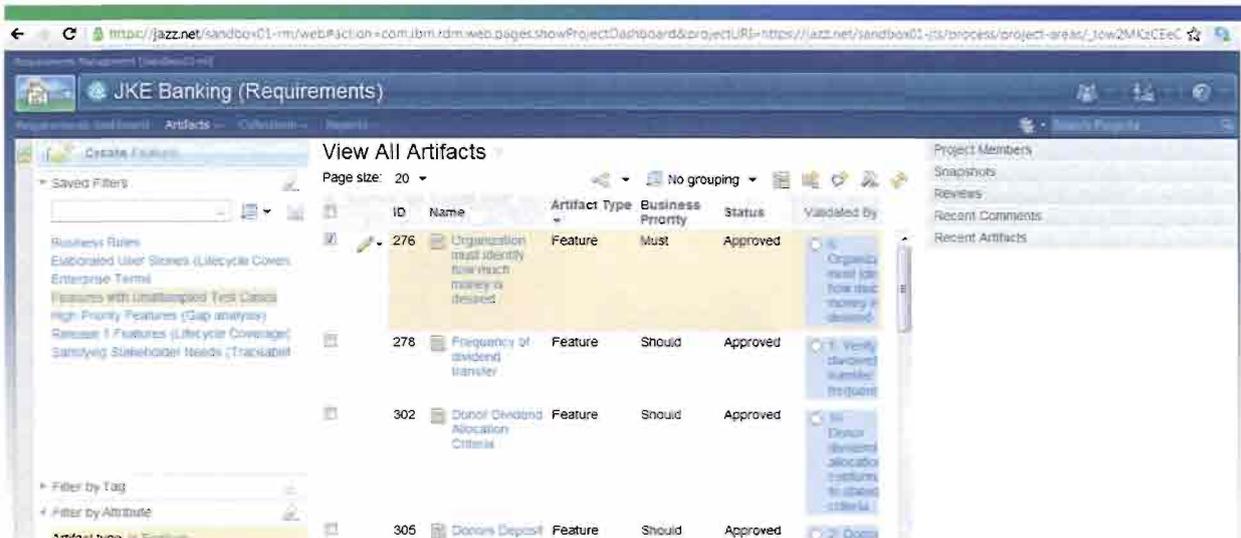

Figure IV-127: Establish Traceability Between Requirements and Test Cases

In addition, a test plan can be linked to the Requirement as follows:

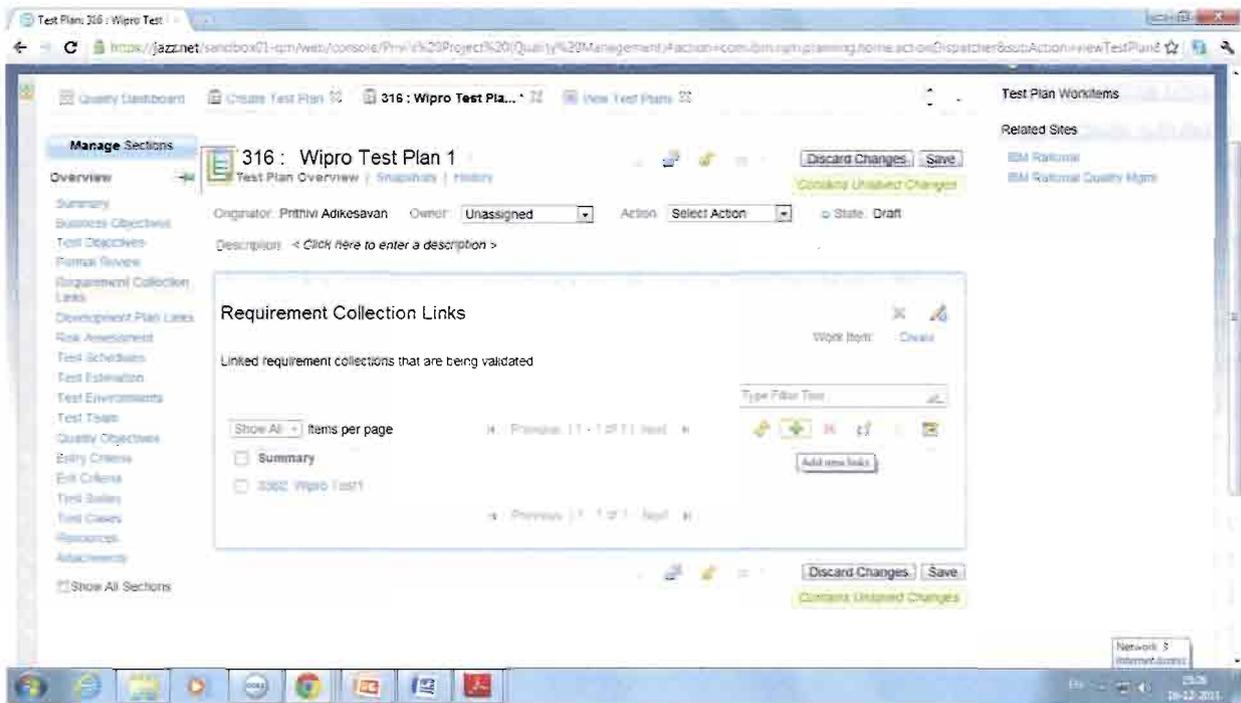

Figure IV-128: Associate Test Plan with Existing Requirements

The Test Plan can be associated with the existing Requirements using Click “+” icon in the Test Cases section and also removed by Clicking “X” icon

- vi. Describe the methodology that will be used for Parallel Testing including the State of Nebraska’s requirement for the IV&V Contractor oversight;

Wipro/IBM understands the need for validating the functional integrity and accuracy of the proposed COTS solution to be exactly in line with the existing N-FOCUS Solution. This becomes one of the fundamental requirements to establish that the COTS solution is operationally verified and validated to accurately replicate the results that would have come out of the N-FOCUS.

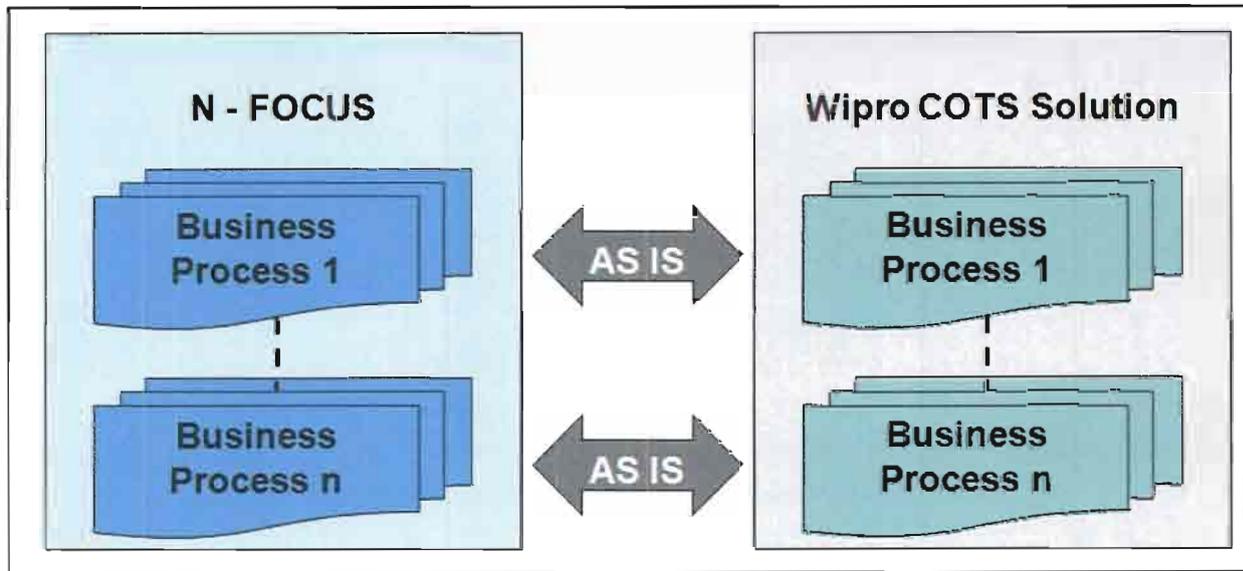

Figure IV-129: Parallel Testing Methodology

Wipro/IBM collects all the different business processes that are part of the N-FOCUS and create a corresponding mapping list with the COTS Solution. For example one of the Business Process (Enrollment/Renewals) is a process used for enrollment of members and renewal of existing member towards the end of the enrollment cycle. As part of the enrollment process the new *SmartPro MedEE* would be put through several forms which would be verified through the existing system by entry and validation. In our parallel testing methodology, we take this scenario and create test case to validate this process is taken over as-is as shown in the figure above in the COTS solution. The input data fed into the existing legacy system and the COTS are same and the outcomes from this test indicate the result of enrollment which is validated from both the system. When the test plans and test cases are created we would work jointly with IV&V vendor for their approvals. The results will again be validated with the IV&V vendor and their sign off would be taken on successful completion. If the results vary then we will redo the testing cycle for the business processes that is on test. We are equipped with tools to run compares and produce a validation report for the results. In summary, we would closely work with MLTC to collect the Use Cases/Test Cases for the current Business Processes which are used to create the test platform for parallel testing.

We understand that the N-FOCUS is a disparate system that has a major component of Mainframe COBOL/CICS and Open System Portal which feeds Medicaid Eligibility Data to various other systems. Our team has studied the existing functional blocks of the Legacy System and would provide a detailed plan to Parallel Test for various components of the Legacy System. Our approach includes a level of automation, creation of baseline test scenario, baseline production data which are used in modeling the Parallel Test Process.

- vii. Describe the approach to parallel testing; and, based on past experience, identify potential risks and problem areas;

Wipro/IBM's approach for Parallel Testing is depicted below and starts with Test Planning during which the strategy, staffing, automation, scheduling, and tool deployment occurs. Prior to the planning stage the detailed test cases/scripts and data that are used for the existing legacy system will be made available to our team by MLTC. The figure below shows the steps we follow in the Parallel Test Life Cycle. We propose to bring appropriate tools as listed earlier to test the COTS solution we are bringing in and look for support from MLTC team to provide the needed support/test assistance to conduct the parallel tests and test options for some of the standalone components.

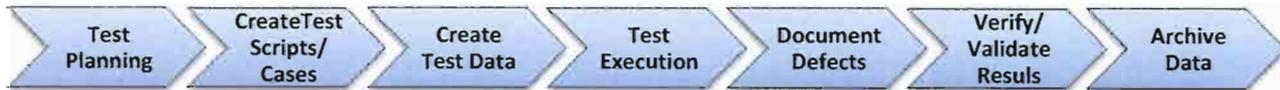

Figure IV-130: Approach to Parallel Testing

Risks and Problem Areas:

- Delay in supply of Test Scripts and Test Cases for the Legacy System, will delay the Parallel testing
- On-going System Changes installed into the Legacy System as part of Business As Usual maintenance cannot be tested
- Enhancement to the existing functionality or business process on the legacy system needs to be dealt appropriately
- Shared Test Environment, Test Data Availability can cause delays in completion of Parallel testing
- Availability of personnel for Data analysis, Defect analysis, proprietary system related inputs to be available prior to start of parallel testing
- Error handling – Parallel testing is not expected to fix the error in the existing system but will merely reproduce
- Disparate components that are standing alone and needing data entry staff to be available
- Interconnects needed to various functional units of the Legacy System to be readily available for the test team
- Sign-off for start of parallel test and the results validation is required to be timely
- Risk assessment, management and mitigation – team to be constituted with representatives from Department, Contractor and IV&V
- Interdependencies and Constraints – Department to provide a background of any that would impact the Parallel testing

xix. Describe the parallel testing strategy, methodology and schedule; including a description of the tool(s) for tracking and reporting of testing activities including, but not limited to, documentation of test scripts, test results, error resolution and re-testing; and

Having experience in State projects our strategy is to run the parallel testing in parallel with integration, systems integration and UAT testing. This strategy will ensure that we proof the new system, functionality by functionality and do not leave the comparison at the end which can be a

cumbersome task. The parallel testing will span across four and half months as per the proposed project plan.

This strategy will ensure that the new system will function exactly the same as the existing N-FOCUS system. If there are any disparities in the new systems they will be fixed before deployment.

Wipro proposes Rational Collaborative Lifecycle Management tool for Test Management across all Phases and Types of Testing. Rational Collaborative Lifecycle Management tool is a single platform End-to-End Software lifecycle management tool. It features Requirement Management, Test Management, Defect Management, and Reporting modules under a single umbrella providing 100% traceability between Requirement, Test Cases, and Defects.

xx. Describe the strategy for coordinating the parallel test, including the respective responsibilities of the Contractor, the Department, and IV&V Contractor

Our strategy to coordinate revolves around the Staff, Schedule, Scope, Deliverables, Change Control, Inter-dependencies, and Risk Management. We propose to handle this by devising a RACI Matrix that would be finalized in conjunction with Department and IV&V. The test team will be steered by a Test Manager along with a PMO team from Wipro who would create the strategy and execute the process involving Department and IV&V.

Table IV-32: RACI Matrix

Tasks	Wipro	Department	IV&V
Test Objective/Scope	R,A	C	I
Test Schedule/Timelines	R,A	C	I
Tools and Utilities	R,A	C	I
Environment and Data	R,A	C	I
Execution and Results	R,A	C	I
Verification and Validation	R,A	I	C
Deliverable Sign-off	I	C	R,A
Change Management	R,A	C	I
Metrics and Reporting	R	I	I,A
Risk/Issues Management	R,A	C,I	C,I

viii. Describe the methodology that will be used for the testing during the data conversion task;

Testing Approach for Data Conversion and Migration

Given below is the approach to be followed for Data Conversion and Migration.

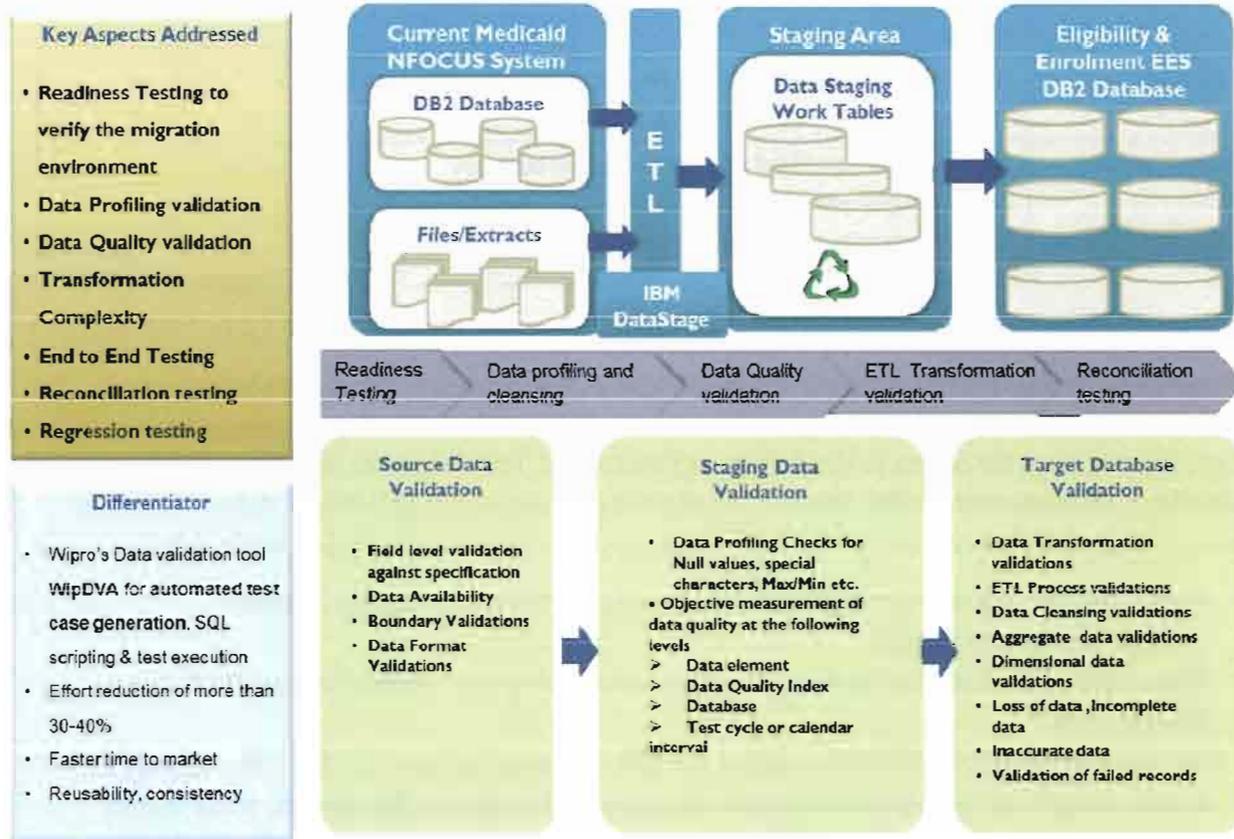

Figure IV-131: Approach for Data Conversion and Migration

The following table explains activities to be performed for each phase of Data Conversion and Migration Testing.

Table IV-33: Data Conversion and Migration Testing Activities

Phase	Activity
Readiness Testing	Scheduler set-up verification Data Sample Size (DSS)
Data profiling and Cleansing	Null / Not Null fields, Min / Max values the fields can hold, Presence of Special Character?UTF-8 Data Types of individual fields, Number of Fields in the source Field validations for Data Types, Uniformity, and Null records from Sources Validation of Count of Records, Defaulted Value Check from Source Error / Rejected Records validation
Data quality verification	Accuracy, Validity, Integrity, Completeness, Non-duplication, Timeliness, Accessibility Coverage of all business rules as per the data quality requirement Design strategy to verify each or group of similar business rules Report Data quality deviations as defects in the defect management tool
Data mapping and transformation validation	To verify various disparate components of the Database extraction, which involves integration and system level kind of testing applicable at a component level

Phase	Activity
Data load validation	To verify various disparate components of the Database Load Verification of data loaded by ETL Jobs
Data Reconciliation testing (for completeness of the migration)	To provide independent verification to the business Ensure no material loss of information Test the integrity of data after migration

ix. Describe how defects will be tracked and reported;

Defects will also be tracked and reported using Rational Collaboration Lifecycle Management. Rational Collaboration Lifecycle Management tool is a single platform Test management system which provides immediate access to the defects at End-to-End Test Processes levels i.e., from functionality down to test execution levels. This provides a clear mapping between defect and other test assets. Rational Collaboration Lifecycle Management tool provides the following benefits

- Single platform for defects reporting and tracking enabling consistency in defect management across project.
- Transparency and visibility to both developer and testing communities as well as higher management
- Categorically extract defect information for different stakeholders. For E.g.: Developers and testers can upload or download relevant data required to resolve the defects, while higher management can extract the metrics at a project or a program level to aid major roll out decisions

Wipro recommends the following defect metrics to be tracked during the engagement from testing perspective.

Table IV-34: Defect Metrics

Metric	Description
Defect arrival metric	This metric measures the number of defect found by Test team and arrived to fix in the release during execution. This count gives total number of defects found in different releases based on number of test cases executed. These defects categorize in different section like Defect type, Defect severity and fixing priority of these defects
Defect Rejection metric	This metric determine the number of valid defects that testing team has identified during execution. $\text{Defect Rejection} = \frac{\text{Number of valid Defects}}{\text{Total Number of Defects}} * 100$
Defect resolution metric	This metric determine the number of defects fixed during execution. The number gives us clear idea about percentage of defects fixed per builds/release out of new logged valid defects. The value of this metric can be compared with previous release to prepare the Bug Resolution Report.
Defect reopened metric	The metrics of reopened defects shows the number of fixed defects get failed during retesting or regression testing. Defect Reopened rate is equal to number of defects reopened by number of defects fixed for the releases.

Metric	Description
	$\text{Defect Reopened Rate} = \frac{\text{Number of defects reopened}}{\text{Number of defects fixed}} * 100$

Rational Collaborative Lifecycle Management tool offers customized reports to suit the needs of all the stakeholders. Typically the following reports are generated and shared

- Defect Severity Report
- Functionality Defect Trends
- TimeLine Defect Trends
- Build/Release Defect Trends

Wipro Test manager will be responsible to track and report the defect to all stakeholders identified for the engagement including the IV&V Contractor.

x. Describe the processes, procedures, and tools that will be in place for problem identification and resolution;

Shortly before rollout, IBM will set up a Deployment Control Room where a Deployment team will be available to the MLTC for collaboration, coordination, and problem resolution. The Deployment Plan will identify the specific number, type, skill level, and roles of the Deployment team.

IBM will also establish an issue management process for issue resolution. Issues are documented, actions are defined with responsible parties identified, and solutions are tracked to completion. Unresolved issues are automatically escalated through technical and management chains until tough issues are resolved.

IBM will also identify and define the key tasks, milestones, and dependencies as necessary. This will be integrated into the work breakdown structure while aligning to the Project Management Plan. Operations and administration procedures related to deployment will be included at this stage.

xi. Describe how defect tracking will be used to identify organizational or procedural weaknesses and track the resulting corrective actions;

IBM will provide a software-based defect tracking system capable of providing a level of detail and reporting and, at a minimum, facilitate the following functions:

- Capture details about each defect
- Review all open issues and assign a priority and resources responsible for resolution
- Record a resolution time estimate during and delivery date with an explanation upon resolution
- Recurring reports throughout the project where the reporting of defect root cause trends will aid to identify operational issues or gaps

xii. Describe the Contractor's proposed organizational structure and management of the testing function;

Please find the diagrammatic representation of testing organization

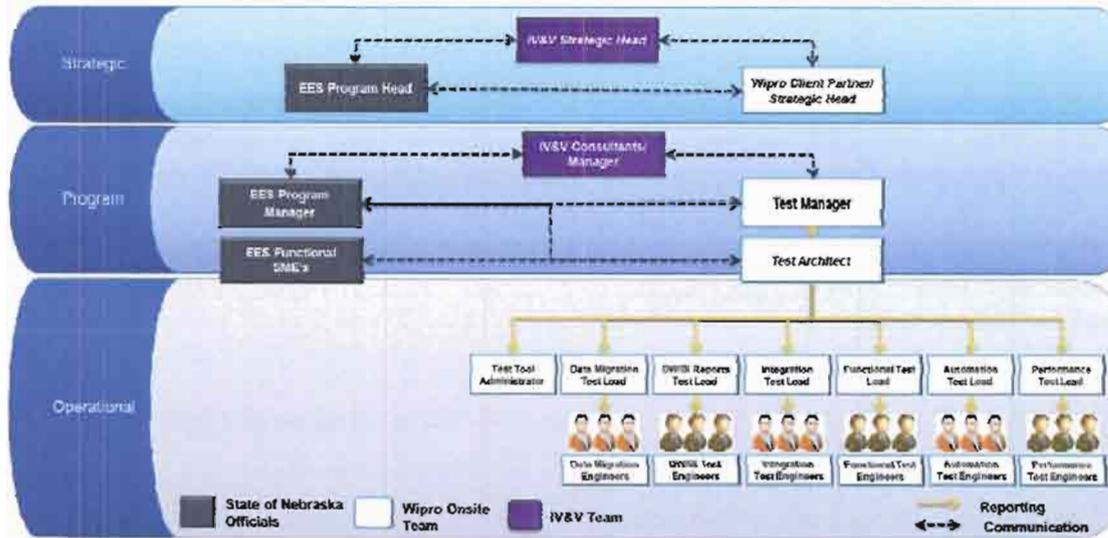

Figure IV-132: Testing Organization

The distribution of responsibility across the layers is outlined in the table below:

Table IV-35: Distribution of Responsibility Across Layers

Layer	Indicative Responsibilities
Strategic Layer	<ul style="list-style-type: none"> Handle program related escalations and works out resolutions Participate in meetings on weekly/monthly/need basis Publish daily/weekly/monthly reports Responsible for the overall testing related project activities and deliverables
Program Layer	<ul style="list-style-type: none"> Develop Platform Test Strategy and Planning Provide inputs from domain perspective during test preparation and test execution Resolve domain specific issues in Test Life Cycle Review of test case and test result Bridge the gap Business and testing team Review and maintain traceability matrix Impact analysis for Regression Coverage Prepare and Maintain Traceability matrix Defect management Metrics Tracking Co-coordinating with IV&V vendor and EES stakeholders
Operation Layer	<ul style="list-style-type: none"> Develop solution designs for the processes Creation of Test scenarios Develop process artifacts for the allocated processes Execute Test cases Prepare Defect Report

Figure IV-133: Organizational Structure and Management for Testing

- xiii. Define how defects and other issues reported by the Department will be analyzed, tracked, resolved; required system changes implemented; and integrated with other project phases;

The IBM Rational Team Concert will be used to track software defects. These defects will be triaged by a team composed of State staff, IV&V, and Wipro/IBM members. Based on severity, these defects will be prioritized and worked to resolution. Defects that are prioritized and minor or trivial may, as mutually agreed upon by the State/IV&V/vendor team will be incorporated into a future release. Defects are maintained within the RTC application and are available for incorporation into future projects and/or project phases as desired.

xiv. Describe how the Contractor will work with the Department and EES IV&V Contractor to develop the Acceptance Test Plan and Test Cases;

As part of User Acceptance testing, MLTC Business users will perform testing of whole system and validate it against expected result from Business aspect as well as from usability front. UAT happens after completing the SIT and Performance testing. It is carried out in UAT environment or environment which resembles the production environment.

For **SmartPro MedEE** System, System Integration, and UAT testing, Wipro test team will perform below activities:

- Identify the test scenarios for UAT
- Prepare the acceptance test cases
- Review test cases
- Get approval from Business users regarding the coverage
- During Execution Test team will support the Business users

Joint methodology of Acceptance testing is mentioned below.

Figure IV-134: Joint Methodology of Acceptance Testing

Wipro will analyze the business requirements to prepare the Acceptance Test Plan. After the test plan is created it has to be reviewed by the Department as well as by the IV&V vendor and an approval has to be taken from both the stakeholders.

After the approval of UAT Test plan we will prepare the UAT test case traceability matrix. On completion of the same the test cases will be executed and test summaries will be prepared. The test summaries will be sent to the Department for sign off and respective sign off document will be mailed to the IV&V contractor.

xv. Describe how the Contractor’s testing methodology and tools will support the State of Nebraska’s requirement to move to a SOA environment

The testing methodology for SOA environment comprises of the following components:

- V Model – Testing Phases and Process View
- Bottom Up Testing Approach – Technical Testing Approach
- Automation Framework – Higher Test Execution Efficiency

- Wipro Accelerators and Best Practices – To enable Shift Left

V Model

The following is the Ideal V model aligned to support SOA Testing in an enterprise adopting or transforming their legacy platform to SOA based architecture.

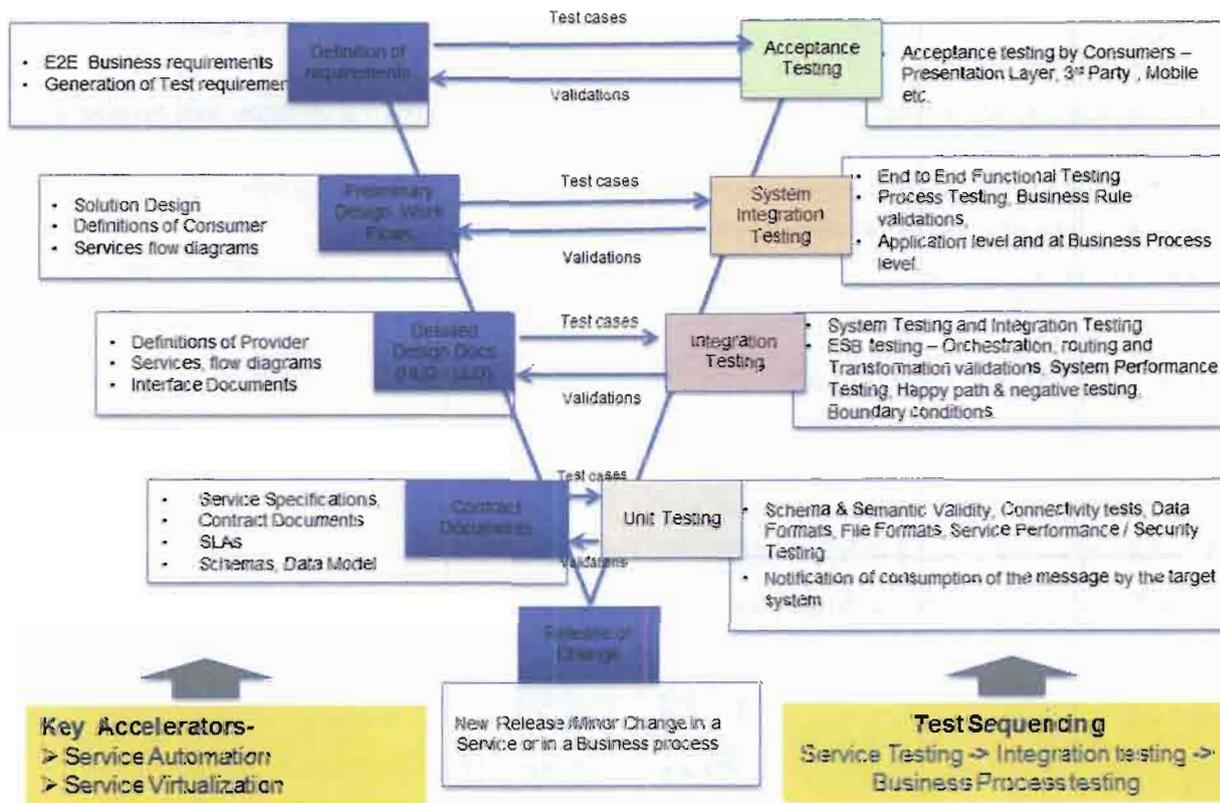

Figure IV-135: Ideal V Model

Bottom up Testing Approach

Wipro recommend Bottom up testing best in class proven approach to validate the entire SOA Adoption or Transformation by layers and ground up. The diagram above depicts the typical bottom up approach in an ideal SOA Platform.

Bottom up Approach suggests testing of individual layers effectively and exhaustively in isolation before integrating them together. This is achieved by SOA Automation tools, Service Virtualization, and efficient processes.

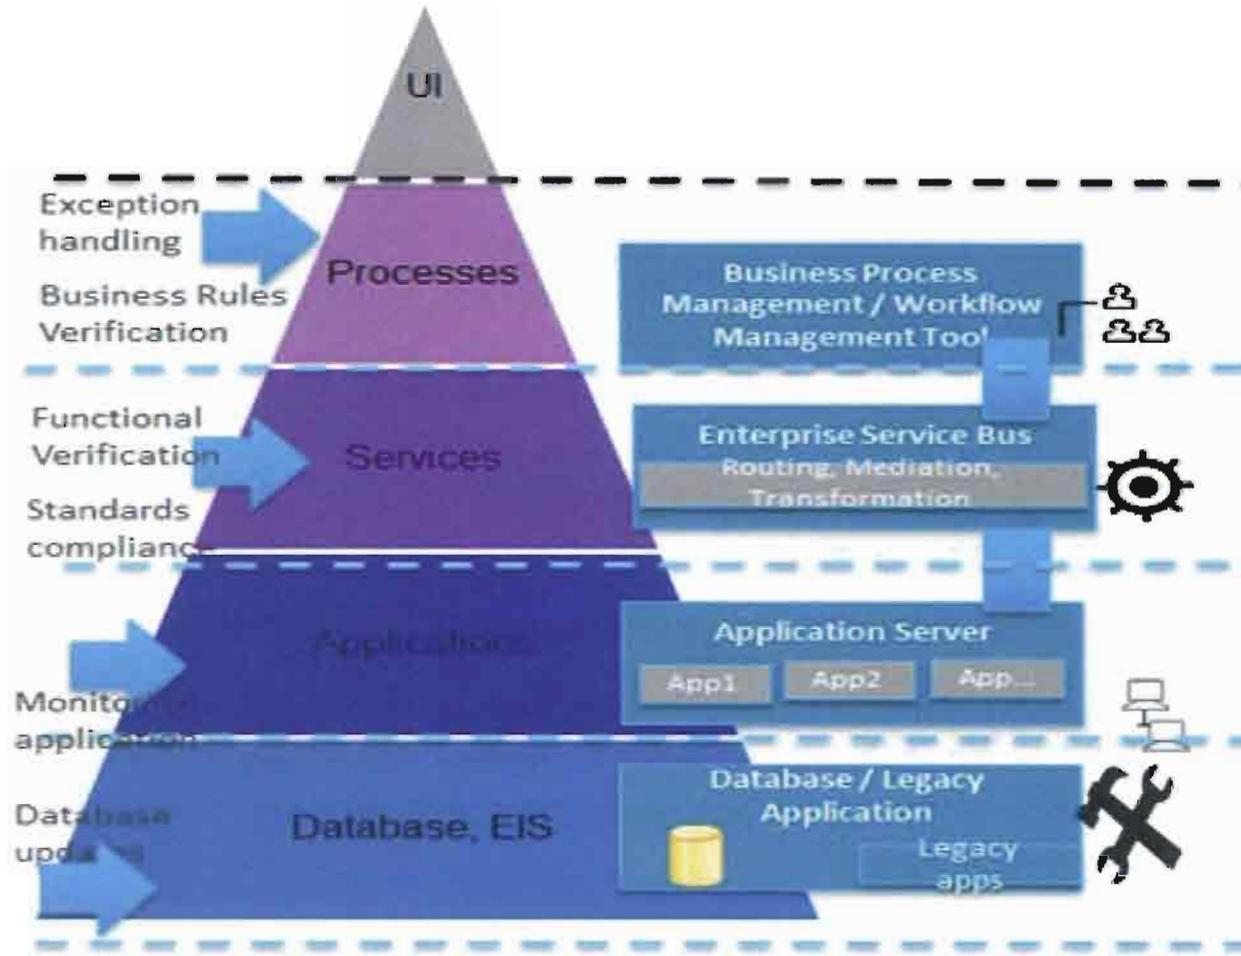

Figure IV-136: Bottom Up Approach

Automation Approach

The approach will be based on achieving 100% SOA Test Automation using Rational Integration Tester and Virtualization Server. The following is the SOA Automation Tool framework and the components involved in testing a SOA Platform.

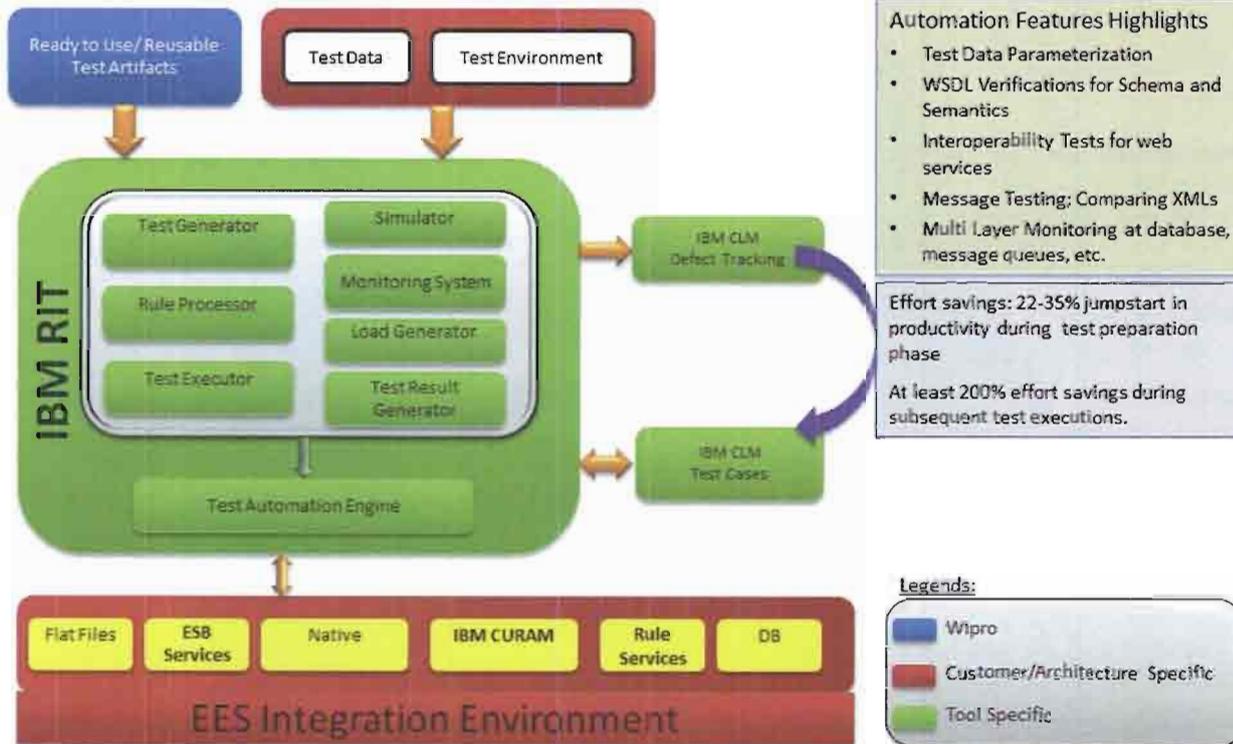

Figure IV-137: Automation Tool Framework

Tool Choice and Recommendation

For MLTC program, the Wipro will use Rational Integration Tester and Virtualization Server.

The recommendation is based on the overall technology stack and larger IBM platform presence both in Business and integration layers of the *SmartPro MedEE* solution. Rational Tool Product can integrate and interlock with various IBM integration platform products and technologies that are implemented as part of this product. In addition, the existing testing toolset being Rational it is appropriate to bring in the rational integration tester to seamlessly integrate in to the existing tool chain with minimum disruption.

Toolsets and Integrated Tool Chain

Any Testing Effort will be optimized and bring our best value for lower cost based on the maturity of their tools and the integration between tools. SOA Test Tool chain is about integration of different tools used during a SOA Testing Approach.

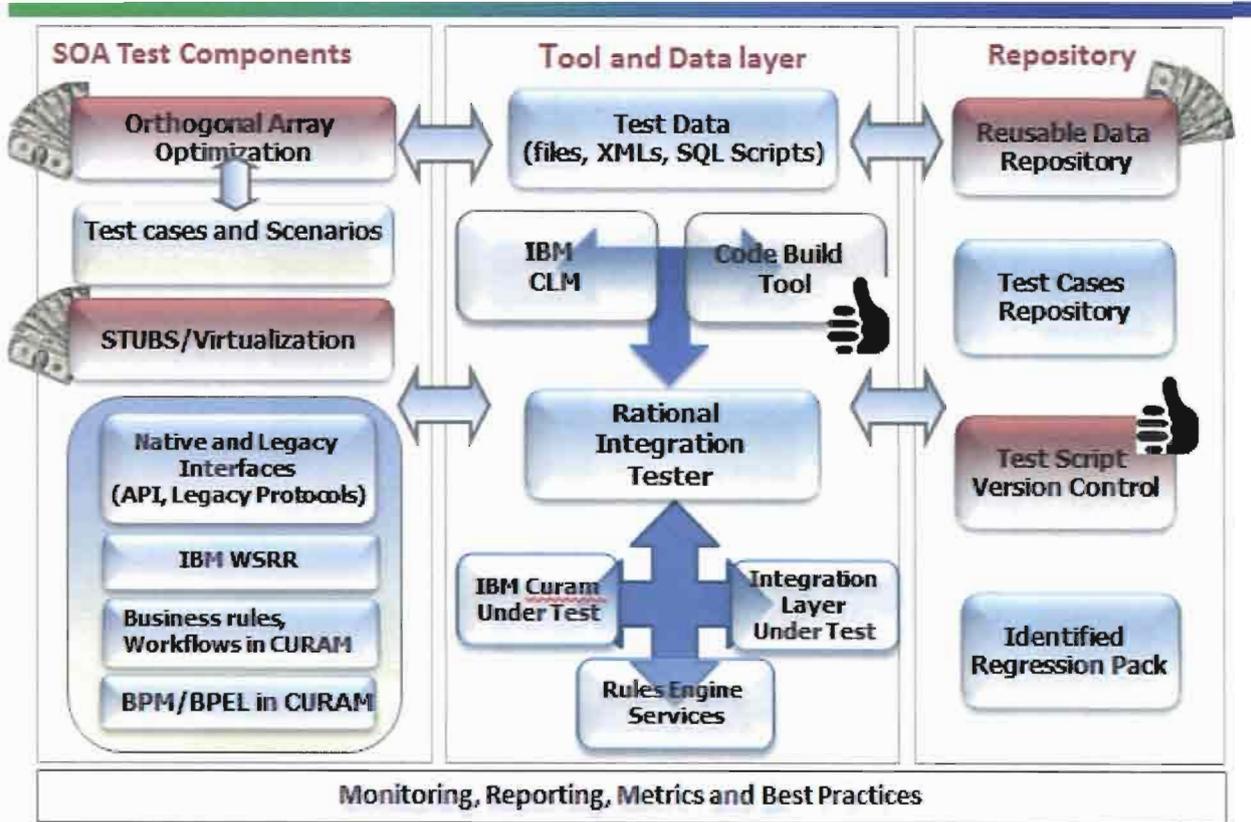

Figure IV-138: SOA Test Tool Chain

Table IV-36: SOA Test Tool Chain Description

Integration Components	Tools (Example)	Remarks
Orthogonal Array Optimization	Wipro Online Tool	This is a Wipro online tool used for web services testing to generate possible combination of data to be tested. Effective for schema up to 15 elements.
Simulation	Rational Virtualization Server	Eliminate constraints and dependencies in the platform
Reusable Data Repository	Rational Integration Tester	This would help create values to those elements as per its data types. Tools generate their own random values. This can also be further streamlined to generate business sense values.
Test Scripts version control	IBM CLM and/or SVN	Versioning of Automated scripts can be done in IBM CLM and/or CVS/SVN. This versioning is based on the release in test cases design and execution results.

xvi. Describe how services that execute on the Enterprise Service Bus (ESB) will be unit, integrated and SIT tested;

The following picture depicts the different test phases involved in validation and verification of services hosted on ESB as part of the integration layer and its test layout respectively.

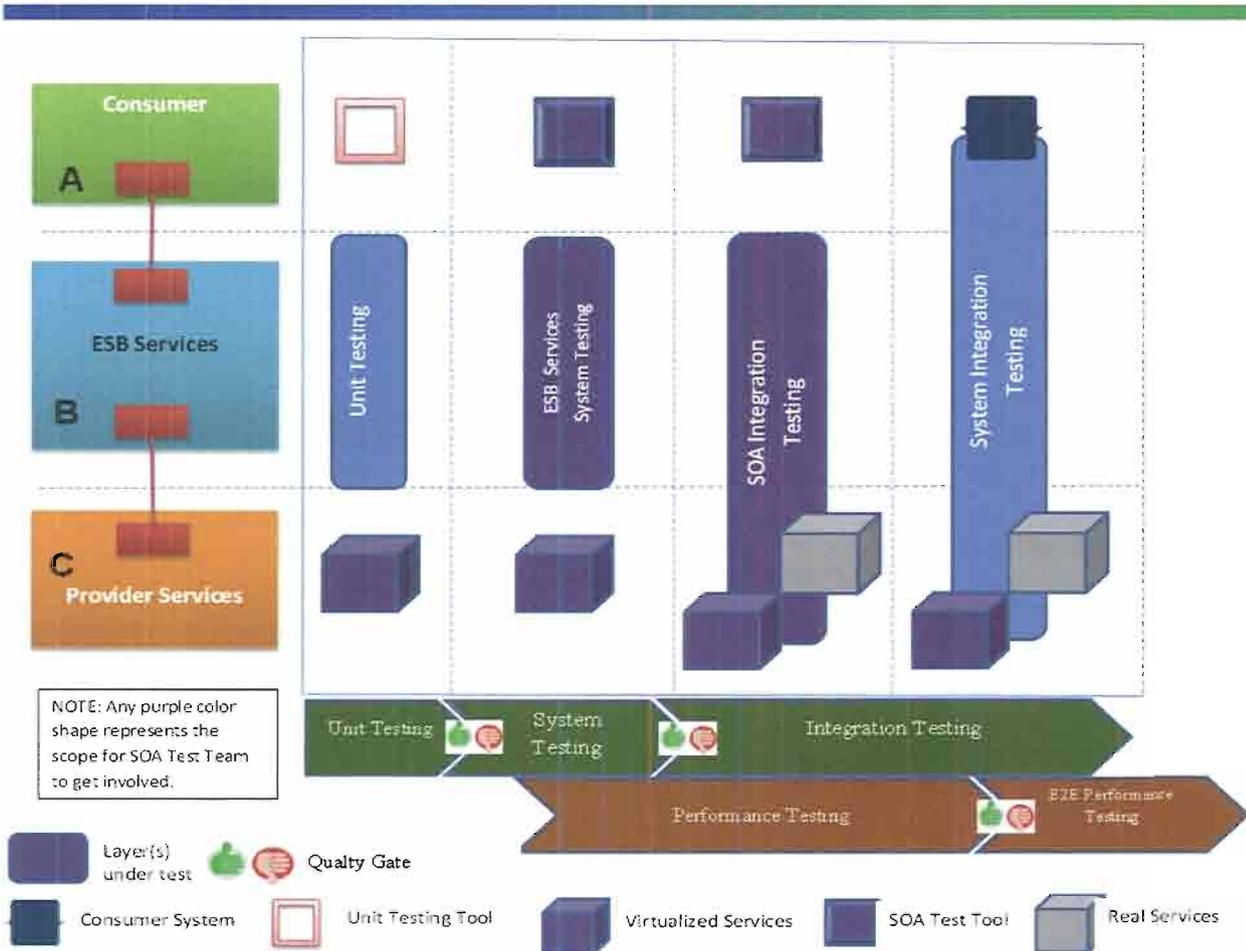

Figure IV-139: Validation and Verification of Services

The following testing will be carried out to ensure that the ESB unit will function as expected:

Unit Testing Phase

Objective

Unit testing is conducted to ensure that proper functionality and agreed coverage have been achieved during coding. Testing will be conducted by the developers and will focus on verification of their module of code developed for ESB services.

This phase will be totally owned and driven by the development teams across locations or in house depending on the arrangement of that project or program.

Approach

The approach of the unit testing is dependent on the Software Development team. SOA Test team contribution in this testing phase is to review the outcome of the unit testing as part of the quality gate focusing on the traceability of requirement against the unit test cases and results of those test execution.

SOA Test team will work with the development team to enable the following

- Virtualized Service to support their Unit Testing
- Defects logged in to a defect management tool
- Traceability built around requirement, services, operations, test cases and results
- Evidences of the test cases are archived and ready for review and audit as required

Quality Gate

Entry Criteria

- Development Complete Code Module

Exit Criteria

- Completed unit testing check lists for each code component
- Completed peer review checklists
- No open severity 1 or 2 defects
- Severity 3 and 4 defects are at nominal levels with agreed resolution plan in place
- Agreed defect resolution plan for all outstanding defects.

Deliverables

- Unit Test Approach or Unit Testing Section of the Project Testing Approach Document
- Test Case traceability to Requirements, Services and Operations
- Test Results and Evidences

ESB Services System Testing

Objectives

- To verify and validate the functional and technical requirements of the Integration layer services
- Test various configured features and properties of the middleware in specific detail
- To flush out early defects with specific configuration and changes implemented
- Creation of Simulated Services using a recognized tools
- Validation of transformation, routing, aggregation features of the Message Broker and B2B Gateway specific to individual transactions or business flow
- Validation and conformance of all regulatory transactions against a Simulated Services

Scope

The Integration Layer services will cover the following components

- IBM WSRR
- IBM Integration Bus
- IBM Sterling Direct Connect

Approach

The following is the middleware System Test topology that will be in use during the system testing.

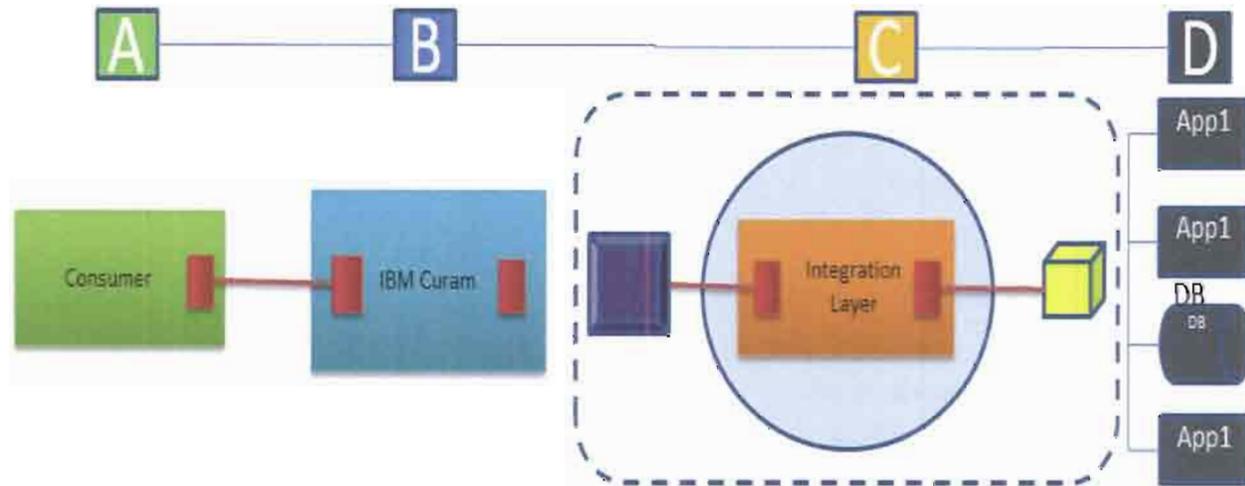

Figure IV-140: Middleware System Test Topology

System testing of an Integration Layer will involve the following in a test environment

- SOA Test Tool – Simulating Consumer
- IBM Integration Bus under Test
- Downstream Service Simulation – Virtualized Services

The same type of test environment will be used for Isolated Performance Testing. This is under the assumption that the environment has the capacity planned to host a limited performance testing.

Types of Testing

During the SOA Testing process across different programs and projects the following are possible type's validation or tests that will be performed in this phase.

- Progression Testing
- Regression Testing
- Positive and Negative Testing
- Boundary testing
- Error conditions and error messages
- Standard Compliance
- Basic Security Testing
- Isolated Performance Testing

Entry Criteria

The following are the Entry criteria to be considered before proceeding with ESB System Testing.

- Integration Layer Services Unit Tested and pass Quality Gate
- Test environment is stable.
- Test Environment has the correct code and configuration levels.

- Privacy and masked data take care.
- Middleware Applications/Services System Test Plan signed off
- Test Resources ready to execute
- No open Severity 1 or Severity 2 defects from Unit Testing
- Test Objective reviewed and coverage ascertained
- Test Execution schedule completed
- System Test cases completed
- Test Data Prepared and ready to use
- Simulated Services replacing the downstream provider services
- Test Environment available, baseline and supported

Exit Criteria

The following are the minimum criteria for exit from this test phase

- 100% coverage of the high and medium priority cases
- Overall 80% Test coverage
- 85% of code coverage No Open Sev1 and Sev2 Defects
- Agreed Sev3 and 4 resolution plan within an agreed threshold
- Sev3 Resolution Plan to close outstanding before UAT Phase
- Explanation for those test cases or scripts not executed.
- Evidence of high priority tests available for audit
- Exit Report Signed off

Deliverables

The deliverables out of this test phase will be the following

- Integration Layer Test Plan (All components of Integration Layer)
- Test Cases/Data Sets
- Updated Requirement Traceability Matrix
- Updated Regression Packs
- Defects Report
- Simulated Services Assets
- Code Coverage Report
- Test Exit Report

Integration Testing

The high-level expectation of this phase is to test the layers built to support SOA brought together for the first time. This validation will certify the Test Environments and limited integrated layers which will be used for End-to-End System Integration Testing.

Objective

Validate the first time integration of layers which has undergone change and impact

- Shakedown tests when integrating the Integrated Layer, *SmartPro MedEE*, Rules Engine, downstream Service Layer and other surround services
- Exhaustive End to End Business Process Testing which is *SmartPro MedEE* and Rules Engine
- To flush out early defects during integration
- Validation of Integration scenarios below consumers with real surround and third party systems; any service or application availability constraints will be Simulated but will be kept at minimal
- Basic Orchestration for selected popular business flow
- Service Versioning and Discovery

The below is the test topology of the SOA Integration Testing which is about testing the integration of Middleware components with provider services and other surround systems.

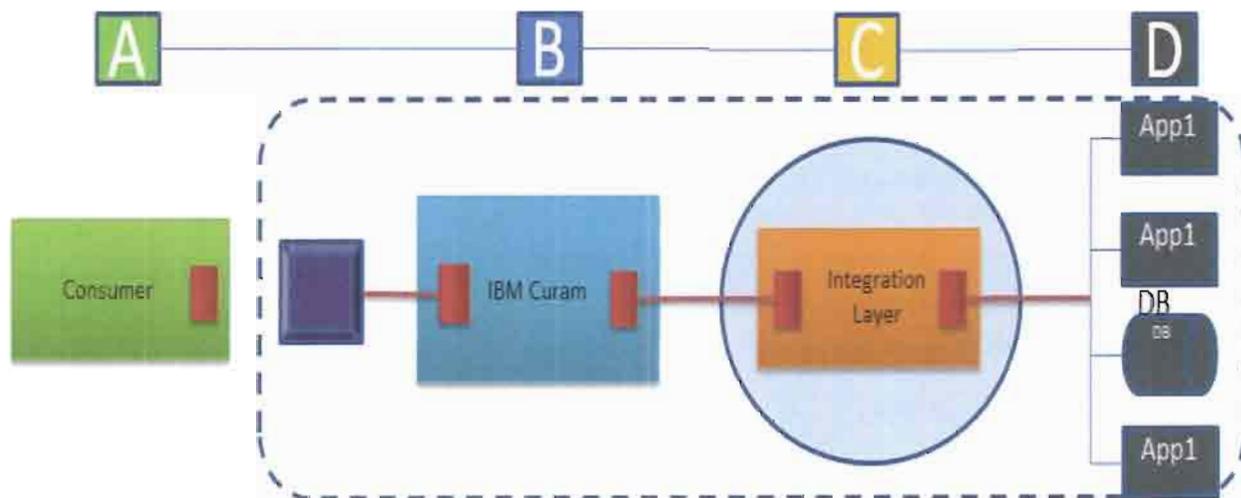

Figure IV-141: SOA Integration Testing Topology

Consumer [A]

This phase would have a SOA Test Tool Client replacing the consumer front end systems which would reuse the test suite prepared from the System Test Phase to be re-executed in the this new Test Environment integrated for the first time recreating the SOA Platform.

Curam [B]

This is the *SmartPro MedEE* and Rule Engine component which is under test that will be integrated for the first time post the change with the downstream services and third party applications.

Integration Layer [C]

These are services hosted by the Message Broker, IBM Sterling Direct Connect, and Transformation Extender.

Host Systems [D]

The internal and external host provider systems delivering the services required to complete the workflow.

Entry Criteria

The following are the entry criteria

- Overall approved Automated Middleware and BPM test suite
- Approved basic SOA Integration Regression tests by business and technical team
- System Testing (Middleware and Services Testing) signed off by the respective stakeholders
- Release notes available for the upcoming build with appropriate fix details
- All Severity 1 and 2 defects found in System Tests are resolved or have an agreed plan for closure
- Zero unit testing defects pending to resolve
- Test data to perform quick integration testing is identified and available
- Signed Off Unit testing of BPM Processes (in case coverage was not possible in previous System testing phases)

Exit Criteria

The following are the exit criteria

- 100% Identified SOA Integration test cases are executed and passed
- Defects logged are resolved or a future defect resolution plan is agreed upon by all stakeholders
- Test Results report and Defect Summary Report has been sent to all stakeholders
- No open Severity 1 and 2
- Resolution plan in place for those remaining Severity 3 and 4 open defects under an agreed threshold
- Sev3 Resolution Plan to close outstanding before UAT Phase
- Test Results have been signed off by all key stakeholders
- Exit Report Signed off
- Overall Coverage of the SOA Testing validated and signed off
- Pending coverage to be planned as part of parallel execution or in higher test phases

xvii. Describe how performance and stress testing of services will be accomplished;

The following are details of the Performance Testing approach for proposed solution for MLTC requirement specific to Medicaid Eligibility and Enrollment (E&E) System with a modern COTS-based Eligibility and Enrollment Solution (*SmartPro MedEE*). Wipro proposes performance testing for the most critical and highly accessed scenarios.

Table IV-37: Performance Testing Approach

Consideration	Description
Wipro has considered the following number of scenarios	Web\Web Services Based – 30 critical scenarios from Web\Web Services protocol (http\html) of IBM Rational Performance Tester with

Consideration	Description
	various roles available i.e. Citizens, Employ <i>SmartPro MedEE</i> , Case Workers, Analyst or Programmer Staff
Wipro performance test team will design\develop performance test scenarios in IBM RPT.	The critical scenario selection will be depended on High Volume, Complexity, and Business\Service Impact

Wipro along with Implementation team for MLTC SMEs will identify the business critical scenarios\work flows\Internet flows\ application navigation etc (for which the performance test scripts will be created). The identified and critical scenarios will be automated and scripts will be generated using the Automated Performance Test Tool IBM RPT. The RPT Tool helps in designing scenarios and simulation of users as per the test scripts and workload. Subsequent step of test execution (with sanity check) ensures the Performance Benchmark is achieved as per SLAs and other execution of another set of high load tests for identification of Performance Bottlenecks

Performance test team will follow incremental-iterative model, whereby, in different cycles, users will be increased with the corresponding data. The main outcome and objective at the end of this testing is to verify overall system behavior and end user experience under varied load, system resource utilization, compliance with defined SLA as per page complexity, performance bottleneck identification and room for performance improvements. The objective is also to establish performance baseline.

Types of Performance Testing

Based on the understanding of the user requirements and identified performance test scenarios, Wipro would define the level of performance testing required to be executed for proposed solution. Given below are various types of typical performance tests that are usually considered.

Table IV-38: Types of Performance Testing

Test Type	Performance Objective Addressed
Benchmark	Provides benchmarks of the performance of the Applications and compare with previous performance testing benchmark
Performance	Measures the end user response time under varying load conditions and reliability of the function\system being exercised under load
Load	Determine whether the system will be able to handle and exhibit consistently the required performance characteristics Evaluate whether system capacity meets the performance characteristics under normal and peak load and futuristic usage conditions
Stress	To identify the optimum configuration for a specific application\system
Endurance	To identify memory issues etc that occur during continuous usage of system over prolonged time duration

Performance Testing Methodology

Wipro shall use its proven End-to-End performance testing methodology as shown in the below figure for carrying out performance testing for MLTC. The overall approach will be implemented in 4 phases as depicted pictorially and explained below. Sub-phases, activities and deliverables in each of these phases are also given in the same diagram. Details of the phases are given in the table below.

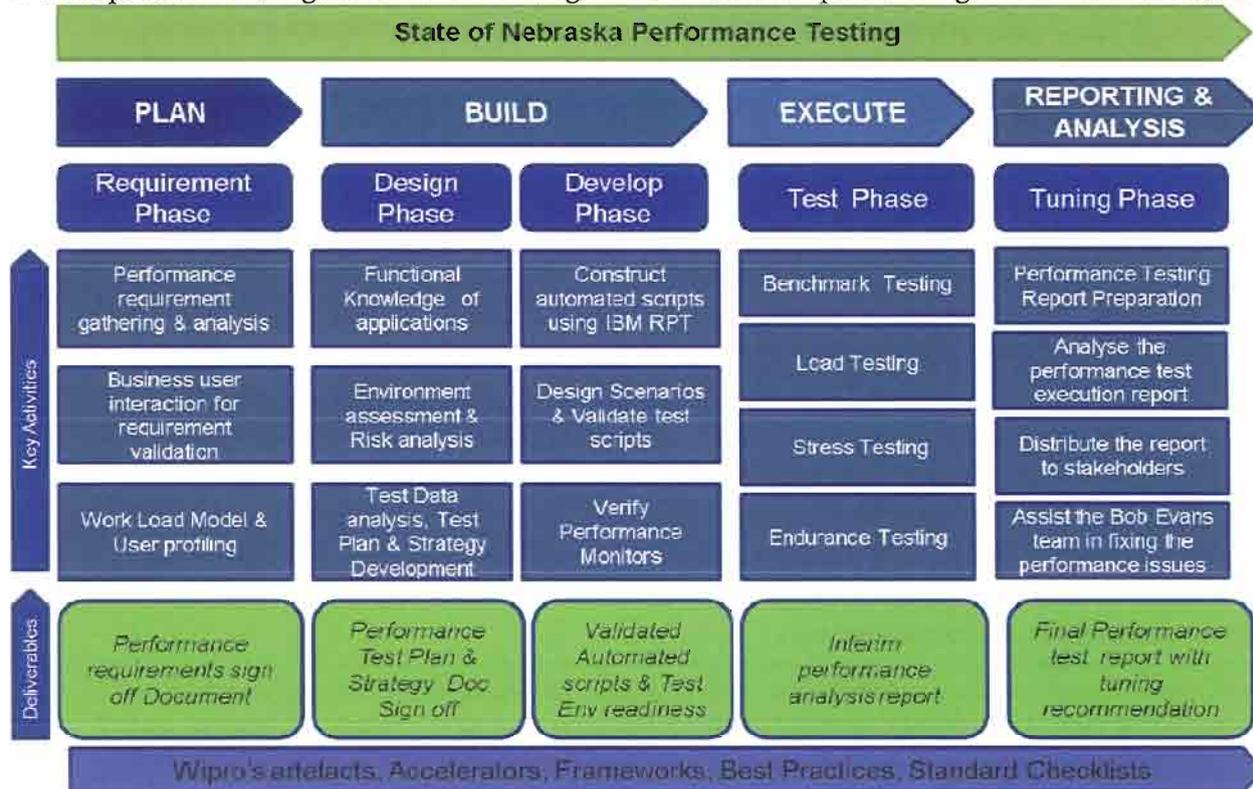

Figure IV-142: Performance Testing Methodology

Table IV-39: Performance Testing Methodology Details

Phase(s)	Activities
Requirement and Design	<ul style="list-style-type: none"> Study of the business scenarios, finalization of the business scenarios and load distribution Finalize performance test requirements and functional knowledge acquisition of EBS processes in scope Understanding work load model and user profile Creation of Performance Test plan and sign off from MLTC
Develop and Test	<ul style="list-style-type: none"> Test Scripts will be developed based on the performance test scenarios Script enhancement will be carried out by using parameterization with test data Test bed that is same \ similar to production environment will be validated by Wipro performance testing team. Wipro will need Production sized database to be made available during this phase Test data will be created and validated by Wipro against each business function requirement and dependency between business functions Help Setting up performance monitors on MLTC servers Dry runs to ensure the scripts are working fine with all the business functions Execution of test scenarios for various types of tests such as load, stress, endurance

Phase(s)	Activities
	<ul style="list-style-type: none"> • Analysis of performance test reports
Analysis and Tuning	<ul style="list-style-type: none"> • Monitor and gather the performance test results for analysis • Analysis of performance test results to identify the bottlenecks and measure against Business goals • Defect reporting and Suggestions to improve the application performance • Test scripts, scenarios, results, reports and log files will be managed and archived for future use • At the end of this phase, Wipro will submit final test completion report to MLTC stakeholders' highlighting the overall performance test report with performance tuning and recommendations

xvii. Describe how message-oriented interactions will be accomplished;

Cúram EAI Connectors provide enhanced integration capabilities to enable other systems to interface with *SmartPro MedEE* applications. The Cúram EAI Connectors architecture provides for the technical connectivity between Business Objects and existing legacy and/or external systems. They allow application developers to work with objects representing data obtained from, or persisted on, legacy, and other application platforms in exactly the same way that they use other Cúram Business or Entity Objects. Cúram Connectors also remove the necessity of writing “low level” code in order to access legacy/external systems.

Currently, EAI Connectors are available for Web Services, JMS-compliant Message-oriented middleware (MOM) products (such as IBM WebSphere MQ), and SQL. These connectors are designed to service real-time or near real-time integration requirements.

EAI Connectors Approach

Each EAI Connector includes the following capabilities:

- Conversion of data and system requests to and from the native format of the middleware, for example, the creation of an outbound JMS-compliant message
- The technical interface to the middleware - for example, binding to a WebSphere MQ Queue Manager, calling the MQPUT interface and managing exceptions, errors and so forth
- Distributed Transaction Processing (Two-Phase Commit) between Cúram and middleware which provides an XA-compliant implementation - for example, IBM CICS
- The architecture is designed to integrate with the generated outputs from the Cúram model. This allows the designer/developer to reuse existing Cúram Business Objects as well as to model and generate Business Objects specific to integration requirements, for example, Business Objects that perform data transformations.
- These Business Objects use particular EAI Connectors to exchange information with other systems, in the same way that standard Cúram Business Objects use SQL to store and retrieve data. The following diagram illustrates connectors within the context of the overall Cúram architecture.

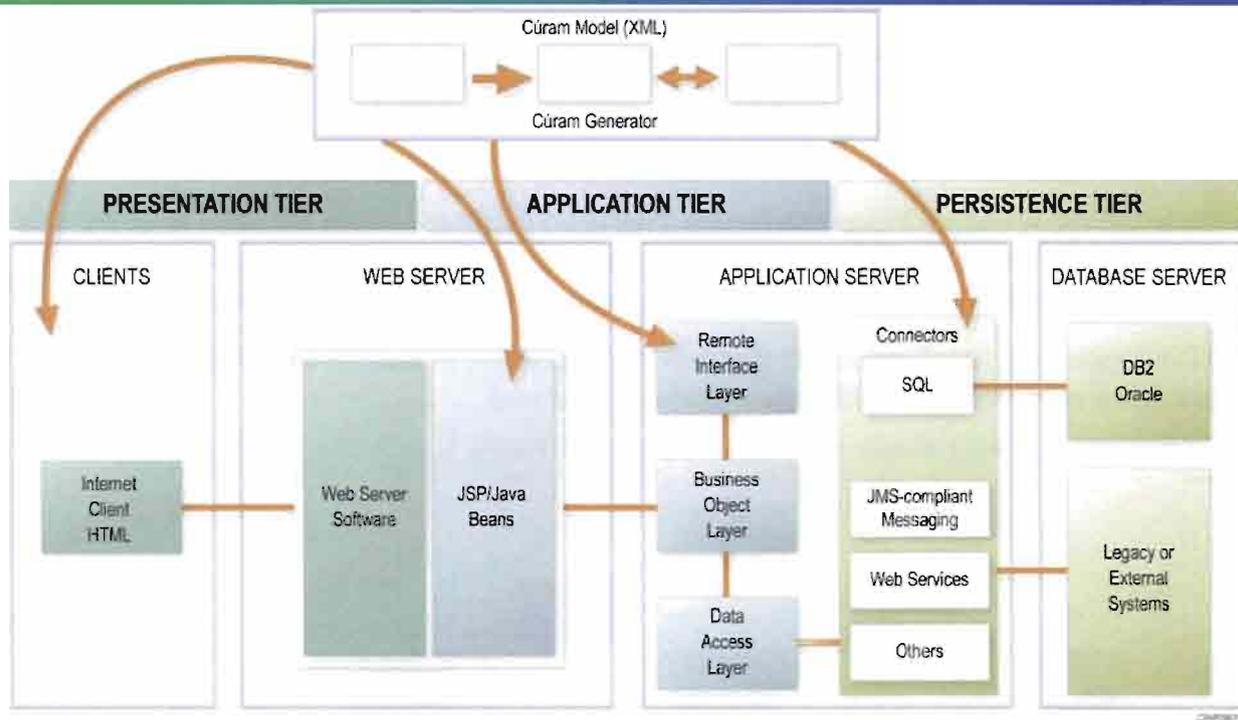

Figure IV-143: Connectors of the Overall *SmartPro MedEE* Architecture

The Cúram Web Service connector provides a generated approach for consuming a Web Service from within a Cúram application. This allows for Cúram to use Web Services to access information from legacy applications, or call Web Services to create/maintain information held outside of the Cúram domain.

The approach for implementing a connector is to include the Web Service Definition Language (WSDL) files as part of the build source for Cúram. Cúram automatically generates the BPO objects used to access the Web Service. These BPO objects can then be called from any other BPO object as per standard Cúram processing.

By using the Cúram Web Services Connector, services become part of the Cúram application and can be treated and re-used as such – the data structures and BPOs that must be used to access the Web Service are available in the application model.

JMS-compliant Message-Oriented Middleware: Cúram provides a JMS-compliant MOM Connector. Where required, the Cúram generator produces code that converts the relevant operation parameter into a JMS-compliant message, places the message on a queue, and optionally waits for another message in response which is then converted back into a Cúram structure and returned to the caller.

xviii. Describe how the testing methodology will accommodate workflow testing;

Wipro will test the workflow processes in a test environment by routing a record through each possible path. These tests will be performed before exporting the processes to production environment to ensure that each workflow process accurately reflects ESS business process. We will first replicate the production data in test environment database so that there is enough data and users

to thoroughly test each workflow process. The first and foremost thing to test workflow is to route the records through all possible paths in the process, including all possible paths through any sub processes. The test team will create test plans to help verify that we have tested all possible routes in a process.

We will also use the Workflow Process Definition Tool (PDT) provided within *SmartPro MedEE's* administration application to define and maintain workflow process definitions. As with all configurable *SmartPro MedEE* functions, the PDT is presented to users as an online web application. The PDT incorporates a visualization tool that provides a graphical image of a workflow. The screenshot below shows how a workflow as displayed by this tool.

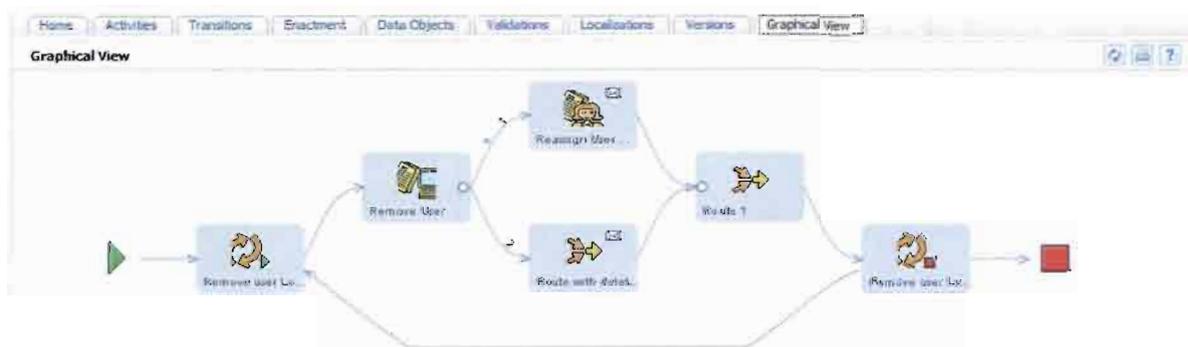

Figure IV-144: Graphical Representation of a Sample Workflow

Being able to validate workflow process definitions before they are released into production will be critical to the success of this program. The PDT will also be used to perform this type of validation. The PDT function will be used to check a process definition against a series of validations and to report any errors that arise either in the overall workflow or in specific activities or transitions. These checks will assist in producing a valid and well-formed workflow.

16. Data Conversion Task

The *SmartPro MedEE* solution is flexible and scalable to meet the current and future needs of the MLTC. The solution is SOA-based, layered, and easily integrates with other internal and external systems, as portrayed in the diagram below.

“Data migration/conversion is more than moving data into a new application; it’s about making the data work within the new application.”

Nebraska's Enterprise-ready Medicaid Eligibility and Enrollment System

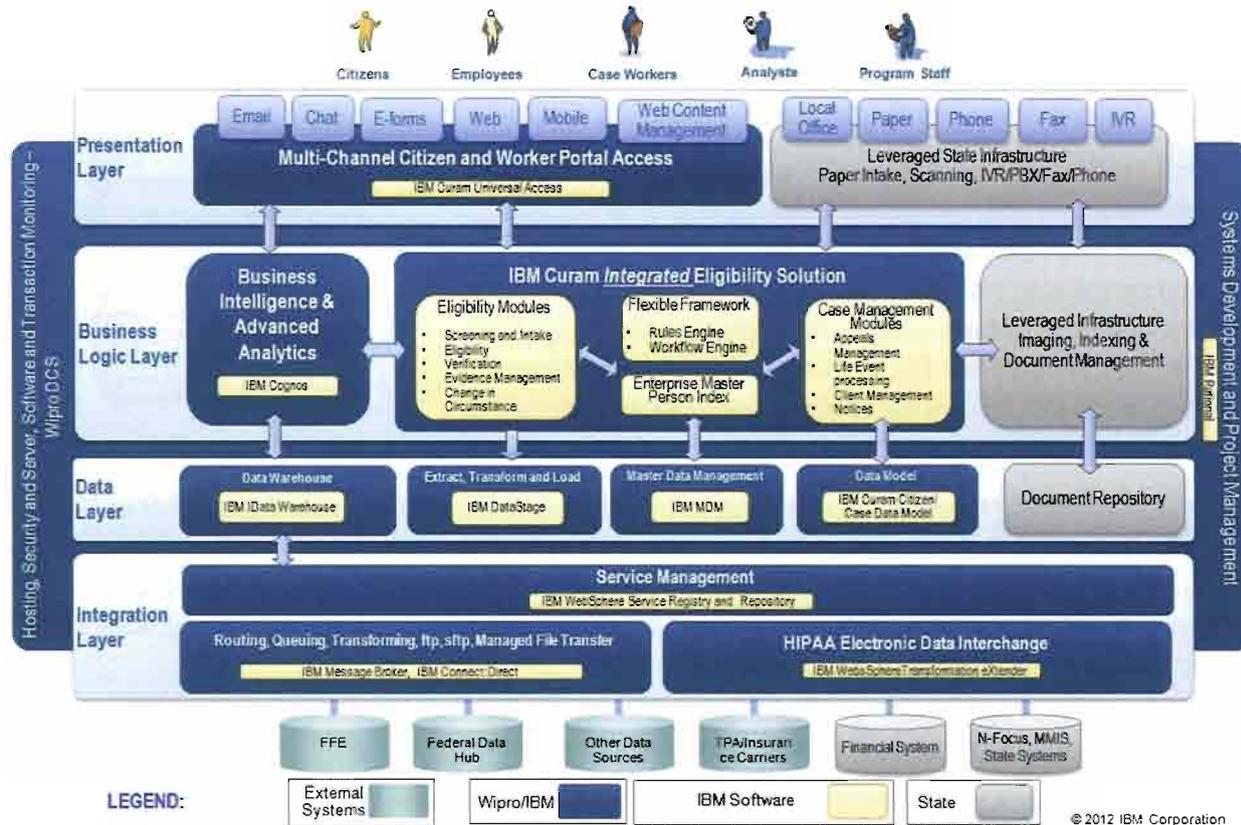

Figure IV-145: The *SmartPro MedEE* SOA-Based Solution

SmartPro MedEE is comprised of three primary application components: IBM Cúram for Eligibility and Enrollment; Cognos for Business Intelligence; and LifeRay for general Portal functionality. These primary applications execute on standard tools and middleware components such as IBM WebSphere and DB2. All components will be hosted within Wipro's Omaha, Nebraska and Tempe, Arizona data centers, executing on IBM PureApplication integrated server appliances.

As a guiding principle, *SmartPro MedEE* minimizes the number of system administration tools during Operations and Maintenance, to increase the effectiveness of the support team and to reduce overall costs. The use of IBM's PureApplication server appliance, specifically PureApplication's PureSystems Manager (PSM) as the core tool for technical system management is central to successfully executing this strategy. PSM provides a single unified tool environment for Application Management, Web Services Management, Systems Management, Performance Monitoring, and Workload Management.

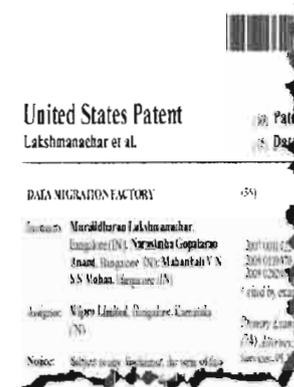

The *SmartPro MedEE* solution integrates easily with other State and federal systems and allows MLTC to enjoy the benefits of the flexible and adaptable architecture inherent in our solution.

Data is an immensely valuable asset of Organization which is built over years of operation and poorly managed Data Conversion/Migration leads into issues that could set an enterprise back by several years in today's scenario. Especially in context of Healthcare, the data is of utmost criticality

being the foundation for many core applications and processes which in turn have significant impact on welfare and proper care of the people.

Based on our own experience of having handled complex data migrations, we precisely know how to make migration successful and its impact on the organization in case of a failed migration.

For successful rollout of *SmartPro MedEE* transformation program, Wipro proposes to use relevant capabilities (applicable to MLTC environment) of its patented “Data Migration Factory” solution underpinned by a strong enterprise information framework, solution accelerators, flexible and execution model approach to manage Data migration requirements of MLTC. Wipro’s patented Data Migration methodology precisely captures the learning over 140 data migration programs executed. Key components of our solution are:

- Data migration framework, methodology, Reference Architecture, templates and other re-usable assets streamlines the migration process and enables tool based automated migration
- Wipro’s Information platform, a web based application developed for enabling Information management process with features like data governance, collection, profiling and cleansing, and mapping.
- Flexible resourcing model wherein Core team takes care of requirement analysis, solution definition and designing supported by a pool of flex team

Data Migration is the process in which data from different Source Systems (N-FOCUS, others) will be extracted based on Cúram Application Operational DB (DB2), Data Warehouse and historical data requirements. Extracted Data will be cleansed, transformed, validated, reconciled by embedding Business rules, Cúram data model, and other relevant transformation rules, and finally uploaded into Cúram database using load utilities. List of high-level activities which should be performed in the overall Migration Process would be:

- Analysis of Legacy Processes, Functionalities and data to identify the gaps between AS-IS and TO-BE state
- Profiling of Data to collect statistics from Legacy Data instances (N-FOCUS and others)
- Defining Conversion/Migration Acceptance Criteria
- Defining Migration strategy
- Mapping of Legacy system attributes to Cúram target loader templates
- Mapping of data elements from existing N-FOCUS relevant tables, proposed Cúram application to Data Warehouse.
- Defining Data Reconciliation and Error Reporting mechanism
- Defining Transformation and Business Rules for Data Conversion
- Developing Migration Solution components and perform Unit and Integration Testing
- Executing Migration Rehearsals to identify the fallouts and generate Data Reconciliation Reports
- Action plan finalization with different stakeholders for Fallout handling
- Finalizing the Cut-over Plan and assist Business users for Business Continuity Planning

- Cut-over for agreed iterations
 - Business as Usual from the Cúram and Data Warehouse
 - Support for Post Migration observations/issues
- i. Describe the data conversion methodology and approach that will be used to convert data from N-FOCUS to the EES data structures including a description of the contents of the Data Conversion Plan. The methodology must include all technical components that comprise the proposed solution including all software (both COTS and custom-developed), hardware, and environments;
- v. Describe all data conversion methods and requirements, regardless of whether an automated or manual method is recommended;

Data Migration – Reference Architecture

The key considerations and inputs for defining the data migration solution are listed below.

Table IV-40: Data Migration Key Considerations and Inputs

Data Migration	Solution Consideration
People	<ul style="list-style-type: none"> • Delivery model : The ramp up and on boarding of the conversion team has been planned to optimize the project cost with dedicated onsite presence enabling better interaction with MLTC users, N-FOCUS SMEs • The Data conversion lead- Include details once identified
Process	<ul style="list-style-type: none"> • An effective reconciliation and error handling mechanism, providing all the rejection details with error code; and rejected data along with our recommendation for error fixation • Mock runs based testing to improve data quality in iterative manner • Upfront Data Profiling and Analysis to un-earth the data gaps early
Technology	<ul style="list-style-type: none"> • Upfront Data analysis to identify the gaps and finalize the remediation plan at an early stage • ETL Tool based Automated Migration • <i>Wipro's patented Data Migration Factory Framework</i> streamlines the data migration process

Conceptual data migration reference architecture is shown in the diagram below.

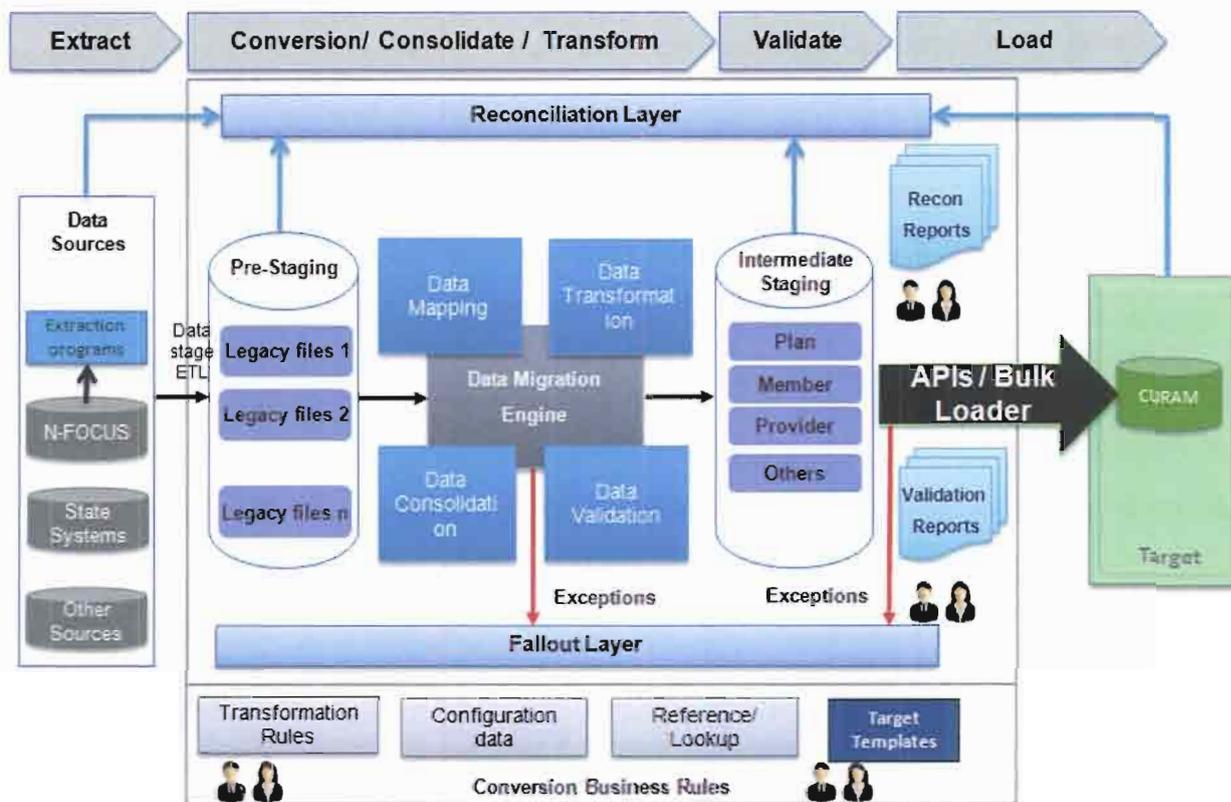

Figure IV-146: Conceptual Data Migration Reference Architecture

**Above mentioned Architecture is for reference purpose only and need to be customized to meet MLTC specific requirement.*

The Data migration Reference Architecture shown above depicts the flow involved in data conversion along with the various interface points between different layers:

- **Pre-staging:** Data from legacy system(s) are extracted and consolidated into Pre-Staging area. Consolidated data will be analyzed / profiled to generate the DQ reports. Record counts and amounts are reconciled against the legacy data sources. The staging area will hold heterogeneous data providing a conduit by which source system data can be extracted, transformed, and loaded to the CURAM tables.
- **Post-Staging:** Consolidated data from the Pre-staging schema is enriched and transformed using re-usable Business / Technical transformation rules and load ready files as per CURAM loaders requirement is prepared. Post staging data is validated against transformation rules and rejected records are sent to Fallout area while good records which pass all the validation criteria are flagged for target loading. Record counts and amounts will be reconciled against the Pre-Staging Schema
- **Bulk Loader:** DataStage ETL and CURAM connectors will be used to load master and transactional data into DB2 (Operational database)
- **Fallout:** Records which fails in staging area during validation and that generate errors during loading will not be loaded into CURAM system and collected in Fallout layer for further analysis and fixation.

- **Reconciliation:** All the reconciliation results will be stored in this layer for further analysis and reporting purpose. Reconciliation identifies the number of records that are successfully converted. It also tracks the records failed during the process of conversion and migration. Analysis will be performed on the failed records to determine the reasons for failure and necessary fixes will be applied to the failed records before reloading them into the target database. Reconciliation of records will be done in the following ways:
 - Volume Reconciliation
 - Visual Reconciliation
 - Business Reconciliation (Sensibility Checks)

Different type of reconciliations, which will be performed, will be finalized in agreement with MLTC SMEs.

Data Quality and Data Cleansing

Data quality improvement is not a one-time activity but needs constant monitoring, improvement, governance, and evaluation. Wipro recommends establishing a formal set of business processes as data quality services to ensure consistent quality and a uniform experience.

Data Quality strategy will focus on three aspects:

- Profiling
- Cleansing
- Auditing and Balancing

Data Profiling and Assessment

During this phase, the current systems' data will be analyzed based on the new system's business rules and anomalies will be reported to the State's business team. Anomalies in each legacy system, such as null values, structural issues, duplicate values and business rule violations, will be presented to respective legacy business champions for them to make decisions, on what the business requires regarding transformation of data before being loaded into the DSS system.

Data profiling and analysis will be done on different data sets based on the master data and transactional data. For master data, the full data set will be profiled. For transactional data, sampling techniques will be used for identifying data sets.

During data profiling and assessment, a Quality Indicator checklist will be created revolving around some of the key DQ criteria after a detailed assessment of quality requirements for State's needs. The outcome of the checklist will be modeled as DQ profiling rules and will be maintained as part of the central metadata repository. This approach enables a greater reusability and consistent application of DQ rules across various data elements which can also be leveraged as new data sources / systems come into picture.

Listed below are some of indicative DQ criteria which will be later modeled as part of the proposed DQ rule engine:

- **Metadata Integrity** - Audit completeness of data elements along with minimum, maximum, etc. Examples of some indicators include Total number of source records, Missing file indicators, Missing data etc. Document entity properties and applicable business rules
- **Relational Integrity** - Assess accuracy of data elements and interrelationship like referential integrity checks, missing links check etc. Discover relationships between elements within and across data structures / sources
Primary Key checks detect columns or sets of columns that might be used as primary keys and foreign keys in other tables
Determine relationship between different tables based on the primary and foreign keys
- **Structural Integrity** - Assess conformity of data elements to the expected formats
 - **Table Analysis**
 - Identifies dependencies among Columns of a table which helps to identify the Primary Key, foreign keys, and normalization
 - Analyze cross tables to determine if the columns share a common domain ,which might result in foreign key relation
 - **Column Analysis:** Analyzes the data in specific columns in terms of understanding the following aspects:
 - Minimum, Maximum, and Average length
 - Precision and Scale for Numeric Values
 - Basic Data Types, different date time formats
 - Count of Null values, Blanks, Non-Empty Values
 - Count of Distinct Values
 - Default Values, Garbage/Invalid data, data patterns
 - Valid range of values, available range of values, Arrays of values
 - Statistics, Frequencies, mismatch between metadata and actual data
- **Domain Integrity**
 - Assesses instances of data values that fall in prescribed sets of domain values and flags suspicious data values
 - Measures number of duplicate entities or set of attributes in the records
 - Identifies silos of redundant data across systems in an enterprise
 - Identifies the set of values that are extremes of the normal distribution spread

Wipro's data team will use IBM InfoSphere ProfileStage to conduct a detailed data analysis in order to accurately identify anomalies in the legacy systems' data. The benefits derived using a profiling tool are many, as it substantially reduces the effort for data analysis and improves the analysis by providing reports and statistics on the quality of the data. During data profiling analysis the following points are considered to check the quality of data in a source system. This analysis determines the understanding and base lines the quality indicators and helps determine quality requirements in the following areas:

- Domain Values
- Range Values

- Cross-field verification
- Address format
- Name standardization
- Reference fields
- Formats
- Referential integrity Basic statistics, frequencies, ranges and outliers
- Duplicate identification
- Key identification
- Data rule compliance

Data Cleansing

Cleansing is the process of correcting the anomalies found in the data. The major output of the data profiling exercise is a data quality plan to address the cleansing of the data prior to the load to the new Eligibility System. It is expected that the data profiling exercise will enable identification of all data issues like missing data values, duplicate data, and inconsistent data formats.

Post determination of the data quality rules, Wipro proposes to conduct Business consultation workshops to identify resolutions for current systems' data anomalies that would otherwise fail data validations and determine the course of corrective action for each type of rule violation. Data anomalies will be presented to the State, who will decide on whether data correction or transformation rules are required, or whether the data will be migrated unmodified.

A rule violation can be handled by fixing the data issue, discarding the record and continuing processing, stopping processing, or taking no action.

There are several approaches and options available for data cleansing which is depicted in following diagram:

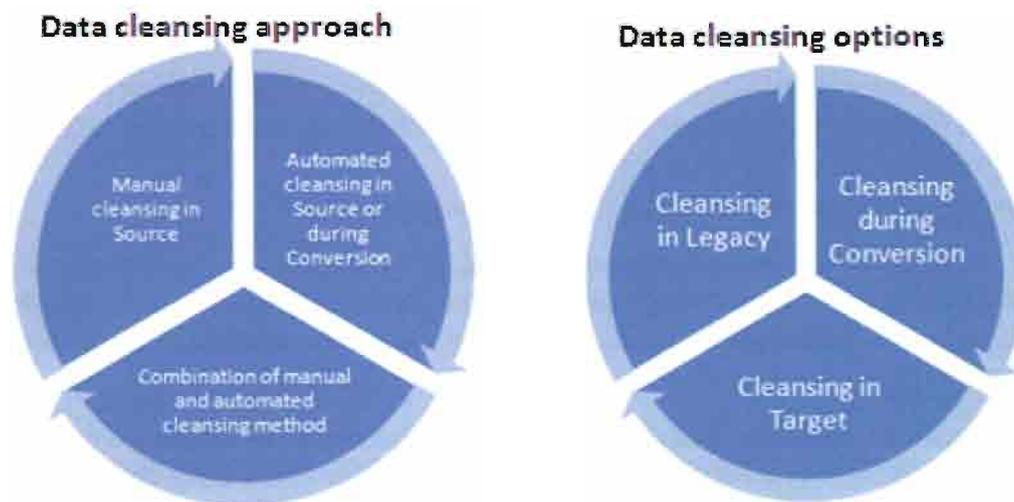

Figure IV-147: Data Cleansing Approaches and Options

Data Cleansing for MLTC will be done on staging data before loading it to the new Cúram system. Data cleansing rules will be derived based on the following key tenets:

- Data Completeness
- Data Conformity
- Accuracy
- De-duplication strategy
- Subject area specific cleansing

Wipro will leverage its extensive understanding of Federal, State, and CMS guidelines, HIT and other standards as well as data enhancement and cleansing technologies while performing the data cleansing activity. Extensive data checks will be performed to identify potential errors in reporting or missing data.

Wipro proposes to undertake data cleansing activities similar to the illustrative cases detailed below:

- Unique ID assignment to each individual for identification purposes as source systems may maintain different identifiers. This will enable a 360-degree view of an individual from each system like Medicaid, Food Stamps, and Child Support.
- Address correction for format structuring and GEO code assignment to enable data display on maps or in geographical reports.
- Application of common standard formats for client data to create consolidated and data enriched records for each provider in case of data being sourced from Physician and Other Healthcare Professionals Directory (PHPD), CMS's Provider Enrollment, Chain Ownership System (PECOS).

Automated cleansing rules will be applied on the data in the staging area. Data Quality / Assessment reports will be generated to the identified user groups.

Fixing a particular data issue could involve any of the following methods:

- Manual Cleansing – Manually correcting the records, primarily done in source systems
- Automated Cleansing – Automated scripts and tool based routines cleanse the data either in source systems or during the conversion process
- Combination of manual and automated cleansing methods

Wipro will use DataStage scripts to cleanse the data during the conversion process. Wipro will endeavor to address most of the data quality issues through simple transformation logic. However, there could be certain cases where specific manual cleansing needs to be undertaken by the State's business owners or SMEs.

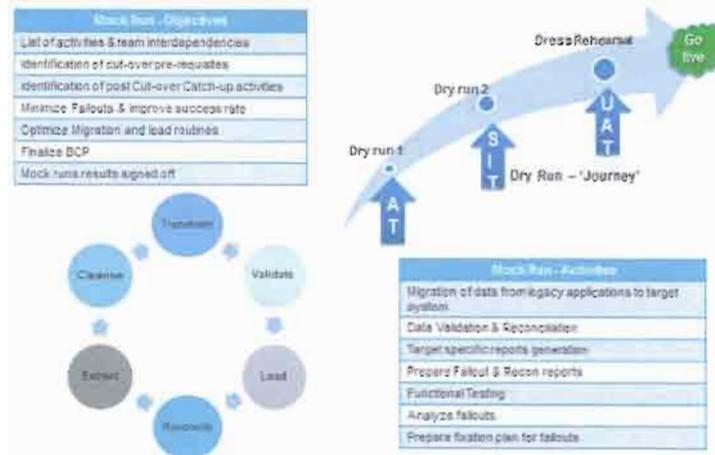

Wipro recommends the use of IBM's Quality Stage Tool to write rules, and execute multiple iterations of cleansing in order to achieve a level of accuracy that allows for a clean data load. All automated cleansing will be attempted in the conversion process. Testing and reconciliation will prove the correctness and robustness of the solution.

Data Migration (Mock Runs)

Wipro proposes a mock / dry run approach for migration readiness testing. As part of our dry runs, both data and functional testing will be performed. We recommend a minimum of three migration rehearsals to gain a better understanding of data quality. The objective of migration rehearsals is to:

- Identify the list of activities and team inter-dependencies which need to be performed during cut-over .This helps in cut-over planning and seamless migration
- Identify the cut-over pre-requisites and post cut over catch-up activities
- Execute dry-runs in iterative manner to minimize fallouts and improve upon the success rate of migration results
- Optimize migration and data upload activities in order to reduce down the cut-over window
- Publish the reconciliation report to all the stakeholders and take business sign-off
- Finalize business continuity plan
- Cut-over / Go-ahead decision / sign-off from business after final rehearsal

Flow of activities during Mock run would be to:

- Move master data along with other related data from N-FOCUS and other sources to Cúram platform and identify the fallouts and their corrective action plan
- Generate reconciliation reports
- Analyze fallouts and finalize fixation plan
- Perform Functional and Data testing
- Fix the issues and prepare for next mock run

Cut Over Approach

Data Conversion/Migration which is a subset of transformation program, including Process, Application and data migration, can be achieved either using Big-Bang or Phased Approach. Both the approaches are having their own advantages and disadvantages. While Big-Bang provides single down time and low efforts but it adds Risk to the overall Migration due to the volume and complexity. On the other hand Phased migration although take longer time for End-to-End conversion but it minimizes the Risk of Migration by migrating the data in smaller chunks. Phasing approach should be decided around parameters like migration Risk, volumetric and complexity, Product and we should plan less volumetric and simple candidates during early phases.

High Level Data Flow and activities during Cut-Over based on our experience are listed below which will be firmed up during Dry-Runs:

- Blocking the transactions into Legacy application

- Initiating Business Continuity plan
- Extraction of data from N-FOCUS and other sources and handover to migration team
- Validation of extracted data to identify gaps and remediation
- Conversion, validation and loading of data in DB2
- High level reconciliation of Data
- Functional testing on Migrated Data
- Changing the inbound and outbound data flow
- Post Cut-Over catch-up activities
- GO-LIVE announcement

Key Considerations for Cutover

Based on our extensive experiences across large scale Migration, we want to share some of the Key Learning for cutover as listed below:

- ‘Practice makes Data Migration perfect’. We will execute mock runs to simulate the cut-over followed by rigorous reconciliation to unearth data issues in advance and will expect MLTC to ensure data validation by business SMEs at the end of each mock run cycle.
- Only master data along with open balances should be migrated to the application. Historical data can be archived in RDBMS format for future references.
- We can explore the feasibility of loading Master data in advance and master data checks can be performed and kept ready before actual cut-over. During cut-over, we should migrate only transactional data which will reduce the outage window.
- Cut-over plan must contain sufficient detail to identify all hand-offs, estimated timings and task successors.
- Weekends should be preferred for cutover as transaction loads during weekend used to be less. Pre-requisites for cutover need to be closed by Friday evening and extraction from Legacy can be planned on Friday night.
- Understanding of what must be loaded during full outage is critical and so also is identification of the outage requirements and business continuity plan during the outage for the entire impacted Op-cos.
- During cut-over, we must try to clear all the fallouts and migrate 100% of the data by fixing the data in staging area even if the rectification is not as per expectation. This is because it is always easy to fix the data in target System if master data is available compared to loading entire data set after Migration.
- Before go-live announcement, data must be reconciled thoroughly and business critical functionalities must be tested in order to avoid post migration surprises
- Transactions during the cutover window must be uploaded into target system before go-live announcement.

Despite of all the cleansing in legacy, we expect some fallout during cutover. To handle the fallouts like missing data, default values for attributes to be agreed with the business in advance in order to move data successfully during cut-over as manual fixation during cutover will not be feasible

- vi. Describe the tools and how they will be used for converting the data; and
- vii. Describe any tools and how they will be used for validating the data.

Tools and Technologies:

Wipro considers listed below tools for Data migration activity:

Table IV-41: Data Migration Activity Tools

Area	Tool	Activity
Data Quality Tools	IBM QualityStage, Info Analyzer	Data Profiling and enrichment
ETL Tool	IBM DataStage	Data Mapping and Transformation
Database	DB2	Migration Staging (PL/SQL and SQL scripting)

Wipro's Extract, Transform and Load solution, IBM DataStage

Wipro proposes leveraging industry leading Data Extraction, Transformation, and Load (ETL) toolset IBM DataStage for data conversion/migration. These tools automate conversion routines, maintain and reuse conversion routines, and automate data migration processes with the ability to start / stop / cancel / reload and repeat the data migration effort as required. Different audit trail and housekeeping tables maintained in the migration staging area enable the migration process to be flexible, recoverable, and repeatable.

IBM® InfoSphere® DataStage® and provide these unique capabilities:

The powerful ETL solution supports the collection, integration, and transformation of large volumes of data, with data structures ranging from simple to highly complex. IBM InfoSphere DataStage manages data arriving in real-time as well as data received on a periodic or scheduled basis.

The scalable platform enables Enterprises to solve large-scale business problems through high-performance processing of massive data volumes. By leveraging the parallel processing capabilities of multiprocessor hardware platforms, like the Power 750 series proposed for our solution, IBM InfoSphere DataStage Enterprise Edition can scale to satisfy the demands of growing data volumes, stringent real-time requirements, and shrinking batch windows.

Workload management capabilities enable policy-driven control of system resources and prioritization of different classes of workloads. Customers can use new workload management capabilities to optimize hardware utilization and prioritize mission-critical tasks, throttle job activities where resources exceed specified thresholds, and assess, assign and reassign the priority of jobs as new jobs are submitted into the queue.

Comprehensive source and target support for a virtually unlimited number of heterogeneous data sources and targets in a single job includes text files; complex data structures in XML; ERP systems such as SAP and PeopleSoft; almost any database (including partitioned databases); web services; and business intelligence tools like SAS.

Real-time data integration support operates in real-time. It captures messages from Message Oriented Middleware (MOM) queues using JMS or WebSphere MQ adapters to seamlessly combine data into conforming operational and historical analysis perspectives. [IBM InfoSphere Information Services Director](#) provides a service-oriented architecture (SOA) for publishing data integration logic as shared services that can be reused across the enterprise. These services are capable of simultaneously supporting high-speed, high reliability requirements of transactional processing and the high volume bulk data requirements of batch processing.

Advanced maintenance and development enables developers to maximize speed, flexibility, and effectiveness in building, deploying, updating, and managing their data integration infrastructure. Full data integration reduces the development and maintenance cycle for data integration projects by simplifying administration and maximizing development resources.

Complete connectivity between any data source and any application ensures that the most relevant, complete and accurate data is integrated and used by the most popular enterprise application software brands, including SAP, Siebel, Oracle, and PeopleSoft.

Flexibility to perform information integration directly on the mainframe. InfoSphere DataStage for Linux on System z provides:

- Leverages existing mainframe resources in order to maximize the value of your IT investments
- Scalability, security, manageability and reliability of the mainframe
- Adds mainframe information integration work load without added z/OS operational costs

In Summary

Wipro will implement a robust Data Cleansing and Conversion functionality to ensure the revised application landscape of MLTC having required data successfully migrated from all applications in scope as well as from Cúram to the DEW.

Wipro believes Data Cleansing and Migration is very critical lot that will ensure success of the overall MLTC program. Wipro has implemented several data migration solutions to its customers, using custom build option as well as solutions using ETL tools. Wipro has executed more than 140+ data migration projects and has gained rich experience by providing migration solutions across customers in Healthcare, Government, Telecom, Technology, Banking, financial, retail domains using ETL based data migration solution. Some of the key highlights of the DM practice are:

- Successful execution of 140+ Data Migration Projects across various Industry domains
- 40+ Data Quality engagements
- More than 1500 ETL Consultants working on projects for various Industry Domains

17. *Operational Readiness Review Task*

- i. *Describe the approach to the Operational Readiness Review.*

For all Wipro/IBM programs, Operational Readiness is performed throughout the Project Life Cycle by producing deliverables and completing tasks. Operational Readiness Review will significantly enhance the Program success by ensuring the End-User environment is production ready. The Wipro/IBM team and MLTC management will work together to develop a readiness program in order to create the desired readiness state. Thereafter, the teams will perform the readiness assessments throughout the Project Life Cycle.

Starting from the initial stage in the CSPMM, the strategy for delivering the End State is shared with the key stakeholders. Key areas of operational change and corresponding potential impacts are identified. With an ORR, usually specific factors are addressed after an initial review of the full system is put into operation. All performance and impact measures will be addressed and documented iteratively. Using the IBM Rationale Suite of Requirements and Change Management Tools (i.e. Team Concert) as well as a dedicated portal-based repository for managing reports and document management, the full ORR lifecycle will be managed and maintained.

Following the creation of the requirements during the Solution Outline, Blueprint, and Micro Design phases of the CSPMM, the teams with the end users appointed to support the MLTC efforts will determine what should be considered end state feasibility. It is at that point when the Operational Readiness Review (ORR) plan is created. The net result is initiating the Configure and Build Stage of the CSPMM. All operational readiness guidelines will be documented concurrently during the Configure and Build stage.

During the Configure and Build as well as Deploy stage, the end state readiness is verified with the end users to ensure full compliance. This enables the Wipro/IBM team or others in the MLTC to identify and resolve project deliverables issues. Testing readiness in the new operating environment with potential adjustments will occur as needed. Once the Configuration and Build stage is initiated, the MLTC staff and clients will be trained based on features deployed to a production environment.

Once the Configuration and Build State of the *SmartPro MedEE* project is initiated, operational modifications will be reviewed and approved by the appropriate parties on an incremental basis (i.e. 1-2x per week). Adjustments may occur to the production environment and transfer responsibility to operating managers at any time assuming all features work and are compliant against the standards determined as part of the ORR.

- ii. Describe the systems, business processes, and procedures included in the ORR to ensure the system is ready for operations.

By nature, the ORR examines the actual system characteristics and the procedures used in the system or end products operation; the goal is to ensure that all system hardware and software as well as personnel, procedures, and user documentation accurately reflect and understand the deployed state of the system.

The following are typical objectives of an ORR:

- Establish system readiness to ensure through examination. Test results, analyses, and operational demonstrations are the byproducts of the examination.

- Confirm that the system meets all the appropriate standards; the system should be able to meet baseline support requirements in all states of operation (normal, contingency, and unplanned)
- Validate that all system documentation meets the required standards and includes all the necessary system configurations to operate as planned.
- Ensure that training processes and procedures are in place to support all aspects of system maintenance, preparation, operation, and recovery.

Adopting the U.S. DHHS Centers for Medicare & Medicaid Services Enterprise Life Cycle (ELC) Operational Readiness Review standards, the Wipro/IBM team intends to deliver a structured ORR that addresses the following:

- Project Information
 - Background Need
 - Goal/Scope/Purpose
 - Stakeholders
- Actual System Architecture Evaluation
 - Address specific actual installed logical and physical design standards for an application. Explicitly identify any differences between the actual and proposed design in the design review
- Data Conversion Plan
 - Address any data conversion issues for each iterative cycle.
- Validation Results
 - Address assessment factors including test cases planned, test cases run, test cases reviewed, test cases passed, test cases failed, test cases to be run, and test cases held. The results will be broken down by severity/impact levels based on resolved and unresolved statuses.
- Operation and Maintenance Management
 - Any documented standards that are applicable for system operations should be reviewed.
- Performance Measures
 - Project specific areas, categories, and indicators that are pertinent to the system operating successfully.

Training and knowledge transfer are an iterative part of each of the phases described within this section.

iii. Describe the methodology that will be used to fulfill the Department's requirement for working with the IV&V Contractor.

Any large-scale enterprise information system deployment requires independent verification and validation. As a program, such as the one being proposed for *SmartPro MedEE* matures,

opportunities for improvement frequently present themselves. Programs that are prepared to capitalize on these opportunities see greater chances for on-time, on-budget success. There are a few things that MLTC leadership can implement to ensure the proposed system works as expected. The Wipro/IBM team has the capabilities to lead such a team on behalf of the MLTC and its IV&V staff. These include:

- Setup a working, regularly meeting Change Control Board (CCB)
- Require transparency between the State, its IV&V contractor, and the Wipro/IBM team
- Infuse a governance structure that allows decisions to be made quickly (within hours versus days or weeks)
- Setup a tight deliverable management process and adhere to mutually agreed upon deadlines.

Throughout this iterative process, adjustments to the program processes, timelines, or requirements are more easily reacted to early in the program. The State and the Wipro/IBM team should understand that the farther along things are in the SDLC, the more difficult and costly changes will be. To that end, the use of an IV&V contractor is instrumental to the independent verification and validation of all system functionality before it is released for public consumption.

The Wipro/IBM team is committed to working with the State's testing team and IV&V designated staff to achieve the vision and goals set forth for the *SmartPro MedEE*. We believe a high degree of involvement by State Staff early on in the Test Program provides two important benefits: 1) reduces risk by identifying and addressing issues at an early state in the process and 2) builds a strong foundation for final stakeholder acceptance of the solution.

Our team recognizes the commitment the State has made in having an IV&V partner involved in testing activities and will outline State Staff involvement as part of the Test Plan. Consideration will be given to prepare materials for State Staff such as an orientation, scope including entry and exit criteria, and schedules so that State Staff are utilized as effectively and productively as possible. Such a symbiotic relationship between The Wipro/IBM team, the MLTC, and the IV&V contractor will take place throughout the entire system development lifecycle.

In addition, there is also a significant amount of input required from the MLTC for performance testing in order to produce results that are realistic, meaningful, and acceptable during IV&V. Our team will work with State Staff and IV&V contractor to complete the following analysis activities:

- Identify scope, which would either consume significant resources (long running), or be performed frequently
- Estimate transaction volume for each in-scope transaction
- Estimate of user counts for specific job functions, as well as average and peak daily load

Based on our experience with performance and load testing, the Wipro/IBM team feels that it is important for the State to provide true and timely input in order to set accurate expectations of system performance so that results are valuable, and that the testing activity itself is successful. The State and the Wipro/IBM team will mutually agree upon reasonable performance measures and the range of acceptance, which will be documented clearly in the System Performance Plan and used as a benchmark for performance testing results. Execution and testing of such measures will be validated by the IV&V contractor.

v. Business Process Reengineering

The Bidder must describe its proposed Business Process Reengineering Methodology, which will be the foundation for the Business Process Reengineering Plan and how it will fulfill the Department's requirements while minimizing the disruption to the organization during the implementation of the EES.

The Business Process Reengineering Methodology must have a set of defined processes designed to assist the Department's workforce and other stakeholders in managing change.

- a. Describe the approach and methodology that will be employed to assess and reengineer the current business processes;
- b. Describe the approach to conducting the Business Process Reengineering Study;
- c. Describe the approach that will be utilized to develop recommendations for business process reengineering as part of the EES design;
- d. Describe how the proposed methodology will measure the results of a change; and
- e. Describe the approach the Bidder recommends for implementation of business process changes associated with the EES in a manner that ensures coordination with training and implementation activities and that ongoing operations are not disrupted.

Successful organizational transformation requires a focused, tightly coupled methodology that incorporates redesign of key processes based on knowledge of the vendor technology capabilities with the application of a systematic approach for managing change across an organization supported by rigorous, disciplined project management.

We propose a top-down approach to taking an organization through the transition from today's current state to a new future state based on Nebraska's overall goals and objectives.

Our process-centric approach, specifically designed to align process and technology, incorporates these key principles in a structured, focused replicable approach. It takes advantage of Cúram-specific workflows and processes based on best practices across multiple clients. The methodology requires identification of key business decisions and other change management issues on the front end of a system deployment, which ensures user engagement and minimizes risks.

This approach focuses on the people side of change that an organization undergoes with the implementation of new case management solution. There is a specific focus on decision making, developing new processes around the technology solutions and providing a mechanism to clearly communicate changes. The BPR team will work closely with the Organizational Change Management Team and Training Team.

Guiding principles include:

- Clear concise understanding of the organization's key business objectives
- Ensuring that the right people are making the right decisions at the right time
- Defining and communicating the future from the top down and implementing organizational changes from the bottom up
- Fully understanding Cúram's potential and capabilities

For clarity of understanding, the change management efforts focus on organization readiness assessment, risk mitigation planning, and organizational preparation by working with the change management and training resources to align efforts around the key efforts to design new processes.

The figure below describes the BPR process that will be used to leverage the *SmartPro MedEE* solution to its full potential.

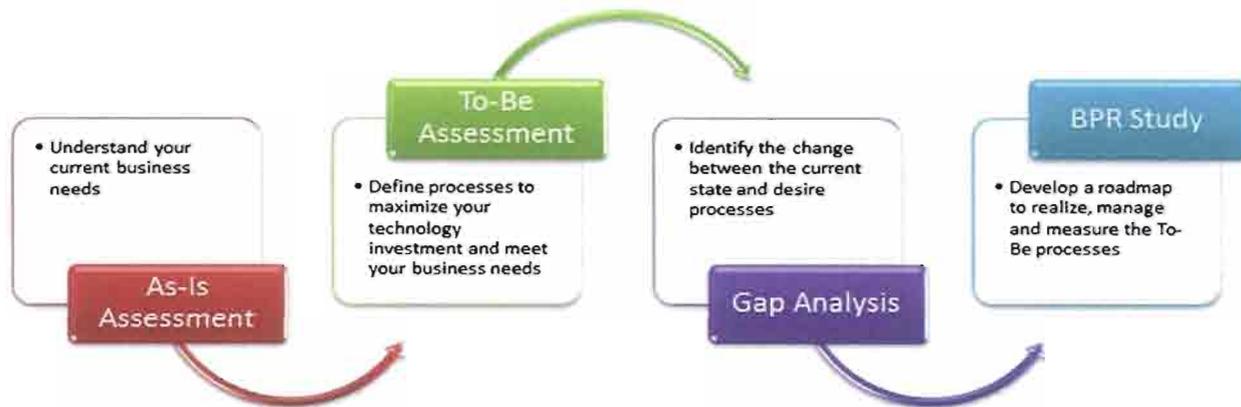

Figure IV-148: Using BPR to Maximize Nebraska's Investment in *SmartPro MedEE*

This section discusses our approach to Business Process Reengineering (BPR), including the tools we will use and how State SMEs and stakeholders will be involved. Based on our experience and knowledge gained from projects of similar size and scope, our team believes BPR activities are an important component in the development of a new application such as the Nebraska *SmartPro MedEE*. Nebraska's existing Nebraska Family Online Client User System (N-FOCUS) Eligibility and Enrollment System is almost twenty years old. It is likely that the current business processes are also dated. Transitioning to a modern, streamlined application can create unique challenges as well as benefits. The purpose of the BPR activities is to define the "To Be" processes. In order for those processes to be successful, we also need to understand what is changing and who is being impacted.

One of the advantages to building *SmartPro MedEE* on an IBM Cúram foundation is the embedded business processes which are configuration within Cúram. This allows the state to examine closely the way other states and government organizations are implementing business processes using Cúram and decide if they To-Be Out of the Box business process is appropriate for Nebraska or needs to be configured differently.

The main objectives of our approach include collaborating with the State to:

- Systematically evaluate current business processes, procedures and interactions with legacy systems
- Define a future vision for the State as it relates to the implementation of *SmartPro MedEE* and identify business practices and processes to meet this vision.
- Identify the gap between current (As-Is) and future (To-Be) processes to understand what steps are necessary to move the organization toward the vision including technology, process, organizational, and people changes.
- Document how practices and procedures will need to change to reach the To-Be vision
- Collaborate across teams to manage the change – Organizational Change Management, System Design and Training.
- Develop a Benefits Realization Plan to measure and monitor the impact of the changes.

As-Is Assessment

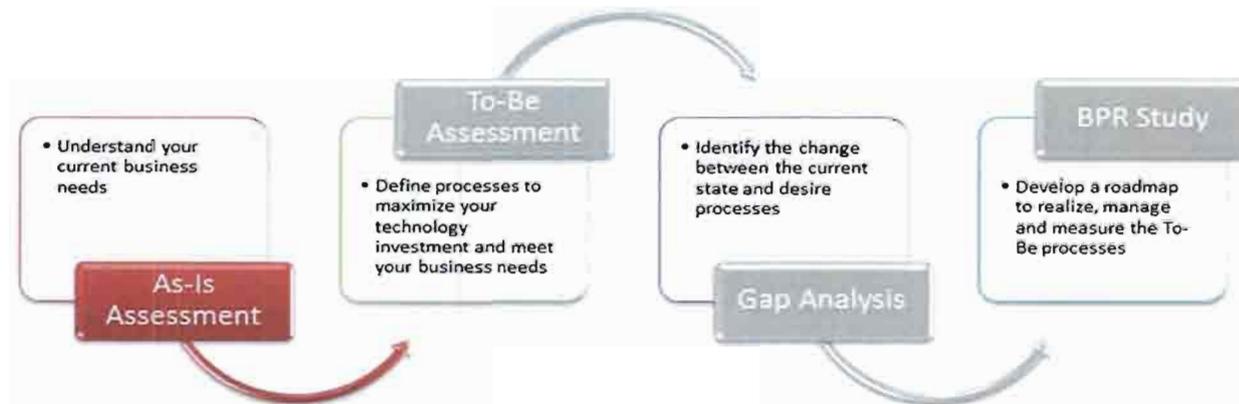

Figure IV-149: As-Is Assessment

The purpose of a high-level As-Is Assessment is to document current business processes for primary functionality and to understand how legacy systems are linked to these processes. Performing an As-Is Assessment accomplishes several objectives including:

- Providing an up-to-date overview of business processes and the relation to legacy systems
- Identifying and documenting key business issues or barriers to change such as legislative mandates, obsolete or ineffective policies, or existing reporting requirements
- Providing support for the business case for change
- Identifying strengths of current processes and opportunities for improvement through the evaluation of existing best practices

The output of the As-Is Assessment will be presented in a Microsoft™ Word document supplemented with Excel tables. The As-Is work product will permit the BPR team to sort and match As-Is data with the To-Be processes and ultimately map to the gaps that are identified. From our experience, we recommend that the team not spend time developing process maps for the As-Is process, since they provide little value to the team. Instead the team focuses on understanding and documenting the current state business needs and processes in templates that will aid the BPR team in the subsequent stages and will serve to communicate the changes to the OCM and Training teams.

Description of As-Is Activities

Review Department Documentation and Walk-throughs. The BPR team will begin by reviewing existing documentation relating to the department's business process and operations. Documents may include policy and procedures, training manuals, previous assessments, process maps or analysis that may help the team better understand the business needs and challenges. The team may also coordinate walk-throughs to observe key processes within the department. This is helpful to understand how business is "really" done.

Review Performance Measures. Understanding what the State measures will help the team understand what is important to the State. It will also provide an objective way of verifying how well the processes are meeting the State's needs. Depending on what is available, this data may also help establish a baseline for the Benefit Realization Plan.

Identify Participants, Schedule Work Sessions, and Focus Groups. Our team will work with leadership to identify the subject matter and business experts who should attend the As-Is work sessions. In addition, our team will work with the State to identify potential candidates for focus group sessions, if required. After the work session and focus group attendees are identified, our team will schedule the As-Is Assessment work sessions and focus group sessions. Our team will email agendas and meeting schedules in advance of the meetings so that individuals will have as much notice and information as possible prior to the work sessions.

Conduct Interviews, Work Sessions and Focus Groups. Collection of As-Is information will occur during a series of interviews and full day work sessions for each business process within a business area. Participants should include the BPR team, department staff, and associated internal stakeholders. Our team will request access to relevant subject matter experts for interviews so that the As-Is understanding is complete and accurate. We anticipate conducting up to 10 individual interviews with department staff, 4 focus group sessions, and 6 hours of As-Is work sessions for each As-Is process. After work sessions have been conducted, additional clarification may be necessary and follow up interviews may be sought as appropriate.

Document High-Level As-Is Processes. Our team will document current eligibility related processes at a high-level using a combination of notes, and excel worksheets that capture inputs, outputs, dependencies, or other relationships among sub-processes and activities. As-Is Process, sub-process, and activity data will be maintained in an Access database with a graphic user interface to permit update and retrieval actions.

Validate As-Is Processes with Business Users. We are aware that the department staff are the ultimate experts and will therefore seek their review of the As-Is documentation before moving on the To-Be Assessment. The validation process is a critical step that should maximize the accuracy of the Gap Analysis and begin to prepare the department for change.

Output of As-Is Activities

The information gathered during As-Is work sessions and interviews will include:

- A Word document that decomposes each eligibility business process into sub-processes and activities. Each process and sub-process will be defined in terms of its inputs and outputs, current associated performance metrics and associated forms and reports
- Excel worksheets that detail the relationships between the activities, decision points, technology and user involvement

The outputs will be used to support subsequent stages and will be incorporated into the Business Reengineering Study.

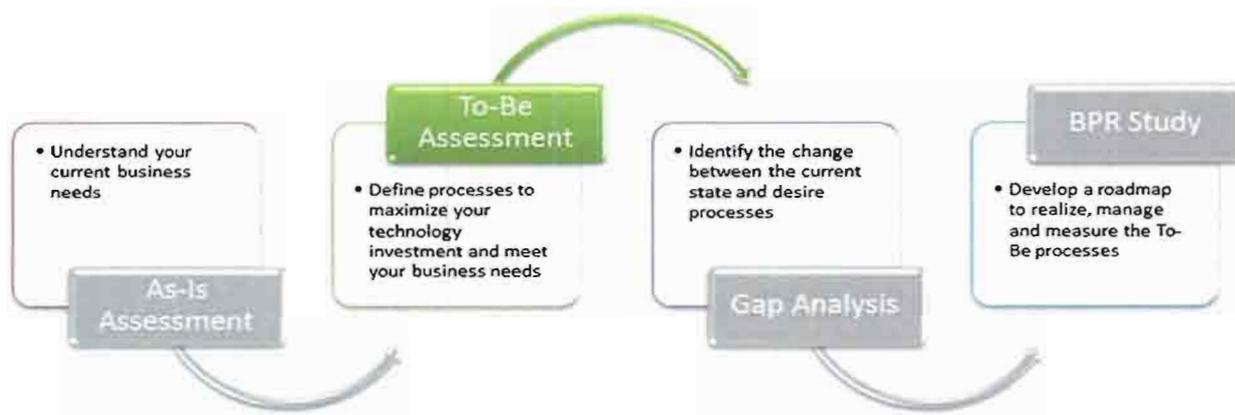

Figure IV-150:To-Be Assessment

After the completion of the As-Is Assessment, the BPR team will begin the To-Be Assessment. The objectives of the To-Be Business Process Assessment are to:

- Establish a future vision that meets the department’s objectives and project goals
- Validate existing requirements and determine how they fit with the vision
- Identify and align the To-Be processes and procedures with the vision
- Eliminate inefficient and redundant business processes

Our team will facilitate a series of To-Be sessions with department staff and stakeholders who participated in the As-Is work sessions and additional SMEs, as needed. Building on the work already started around defining system requirements, our team will help define a vision for the future and then validate these requirements in the context of this vision. To help facilitate this process, our team will begin with Cúram out-of-the-box process maps reflecting industry best practices. Leveraging these maps as the basis of the straw maps used in the To-Be Assessment will save the team time and resources that would otherwise be required to create this information from scratch.

Description of To-Be Activities

Prepare for To-Be Sessions. Our team will develop an initial set of high-level process maps or “straw models” based on Cúram OOTB functionality and our understanding of the State’s business needs. As part of this activity, our team will also:

- Determine agency-wide functional, operational, and technical requirements that may impact the processes
- Assess potential To-Be processes against industry best practices to identify and address potential deficiencies in the processes
- Determine interface points and dependencies with other processes

The “straw model” process maps will be developed in Visio and will incorporate information from the As-Is Assessment and document reviews. Our team will provide the models to key State SMEs

for their review. We will work together with the SMEs to review, validate, and update the models, as necessary, prior to facilitating the To-Be work sessions.

Identify Participants, Schedule Work Sessions and Focus Groups. Recognizing that personnel with the most in-depth working knowledge of existing processes sometimes may not be the most ideal candidates for developing a new vision for an agency, our team will work with department leadership to identify the subject matter and business experts who should attend the To-Be work sessions and those for discrete focus group sessions. Our team will email detailed agendas and meeting schedules in advance of the meetings so that individuals will have as much advance notice as possible.

Conduct Work Sessions and Focus Groups. To-Be working sessions will include a series of up to 5 interviews and 3-5 full day work sessions for each business process within a business area. After working sessions have been conducted, additional clarification may be necessary and follow up interviews may be sought as appropriate.

Using the “straw models” developed during the preparation phase, our team will conduct To-Be sessions to define “future” processes. During the work sessions, our team will work with participants to perform the following tasks:

- Clearly define the To-Be processes and activities
- Map the processes and activities to potential roles
- Determine high-level measurement criteria for each process
- Define process inputs, outputs, handoffs, and dependencies
- Identify policy or procedural changes that may be required to implement To-Be processes
- Identify any perceived barriers to implementing the new redesigned processes

In parallel to the internal working sessions, our team will facilitate up to 3 focus group sessions, each lasting up to 4 hours. The objectives of the focus group sessions will be to verify, gather input, build consensus, and gain buy-in regarding the To-Be processes. The OCM team will be included in the preparation and delivery of the focus groups.

Document To-Be. Our team will document the To-Be Assessment rigorously using a combination of Visio process flow diagrams accompanied by business process and activity documents that define and explain inputs, outputs, dependencies, constraints, or other relationships among sub-process and activities.

Validate To-Be. Our team will review the To-Be process maps and information developed during the redesign. We will facilitate up to 2 validation sessions per functional release, each lasting 4-6 hours. Based on the outcomes of these reviews, our team will incorporate department approved changes and finalize the To-Be process maps. These finalized process maps will constitute the core of the reengineered processes. Supporting documentation will include process flow diagrams and a detailed To-Be deliverable.

To-Be Output

Each documented To-Be process will include the following:

- Conceptual Process Flow: The conceptual process flow in PowerPoint or Word will describe the process at a high-level with pictures, which reflect the major activities that will occur during each step of the process.
- Process Description: Each process contains a high-level overview of the process.
- Sub-process Details: Each sub-process contains a comprehensive description with key information about the sub-process.
- Sub-process Description: Each sub-process contains a description that provides a comprehensive description of the sub-process.
- Sub-process Goals: Each sub-process identifies the goals of the sub-process.
- Sub-process Assumptions/Constraints: Each sub-process identifies assumptions that the team made in developing the system requirements and constraints that affect the requirements. Often, assumptions and constraints result from policy decisions or procedural changes that may be needed to realize an agency's To-Be vision.
- Process and Sub-process Flows: Each process is explained through process flow diagrams using Visio that separate the process into its component parts and illustrate the relationships between these parts. We refer to these as Level 1 and Level 2. For each, we will provide:
- Data Inputs and Outputs: Inputs and outputs are identified for each of the sub-processes. In some cases, these inputs and outputs are documents or electronic alerts. In other cases they refer to specific data elements. Additionally, this section lists interfaces identified in the sub-process.
- Sub-process Dependency: Sub-processes of the process in question as well as other processes and functions, which contain functionality that is essential to the normal flow of the sub-process. These dependencies do not necessarily represent data flow from sub-process to sub-process. Instead, they represent possible triggers into or out of the sub-process.

In addition to the material listed above, our team will store workshop presentations and materials in a project artifact library for future review and use.

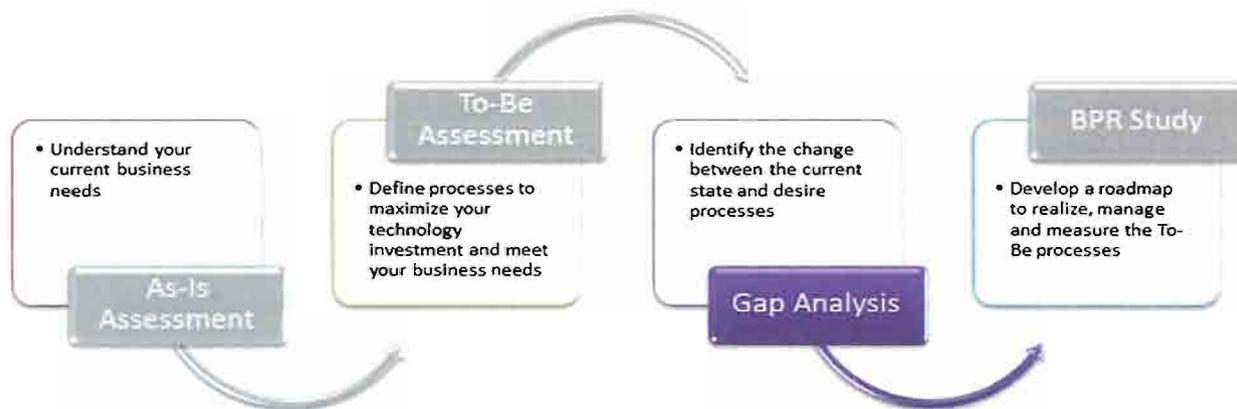

Figure IV-151: Gap Analysis

The Gap Analysis will identify the differences between the As-Is and To-Be Assessments. Gaps will be prioritized and then used to develop recommendations for business and system process improvements for the associated functionality.

Using the information gathered during the As-Is and To-Be Business Assessments, our team will perform a Gap Analysis to identify the differences between current processes (As-Is) and the processes that will be adopted during the implementation of *SmartPro MedEE* (To-Be). The Gap Analysis will serve as the basis for Business Process Reengineering Study. Our approach calls for the documentation of these gaps to occur at the organizational level and focus on the differences in policies and procedures for the major stakeholder groups associated with the organization. The Gap Analysis will include the business and system processes that will need to change to support new business processes, new policies, and the implementation of new technology. The Gap Analysis is a necessary bridge between As-Is and To-Be environments, supporting the finalization of technical and functional requirements.

Members of the Application team will use the Gap Analysis to validate that the system design addresses the changes that must occur to achieve the State's To-Be vision.

Using the documentation from the As-Is and To-Be Assessments, the team will build a table detailing what activities will stop, start or continue with the transition to the new system. This document will provide a clear view of the degree of impact as it relates to each process and to each role. It will be shared with both the OCM and Training teams to help manage and sustain the change. This will feed into the Gap Analysis and be used to create the Business Process Reengineering Study and Recommendations.

Description of Gap Analysis Activities

Prepare for Gap Analysis Sessions. To prepare for the Gap Analysis sessions, our team will analyze and synthesize As-Is and To-Be documentation to a table detailing the activities by process by role that will start, stop or continue with the implementation of *SmartPro MedEE*.

Schedule Gap Analysis Sessions. Our team will work with department leadership to identify the subject matter and business experts who should attend the Gap Analysis sessions. Our team will email detailed agendas and meeting schedules in advance of the meetings so that individuals will have as much advance notice as possible.

Conduct Benefits/Gaps Work Sessions (includes member of Change team to facilitate the Organizational Impact Assessment). Gap Analysis working sessions will include a series of up to five interviews and a full day work session for each business process within a business area. Participants should include the BPR team, department staff, and associated internal Commonwealth stakeholders. The goals of these sessions will be to reach consensus on the gaps between the As-Is environment and the To-Be vision and to work together to develop a strategy for closing the gaps.

While many of the gaps will be closed via the UC system implementation, strategies for addressing organizational, non-systems related processes, procedures and policy gaps will be identified. Given the potential organizational impacts of the recommended changes a Change team Lead will facilitate these sessions to document the organizational impact of implementing the To-Be visions.

In addition, potential benefits that are associated with the To-Be vision will be identified and assessed during these sessions. Our team will focus on identifying measurable/ quantifiable benefits. These benefits may be used by MLTC in future budget requests or to assist in prioritizing improvement opportunities and quick wins.

Document Gaps. Our team will document the Gap Analysis and potential benefits based on the information gathered during the Benefits/Gap work sessions. In addition, information gathered during these sessions will serve as inputs to the Organizational Impact Assessment deliverable.

Validate Gaps and Benefits. Our team will review the Gap Analysis and benefits results with key stakeholders. Based on the outcomes of these reviews, the Wipro/IBM team will incorporate approved changes and finalize the Gap Analysis and potential benefits.

Gap Analysis Output

The Gap Analysis output will be documented in the BPR Assessment and Recommendations deliverable that is defined at the end of this section.

Gap analysis data will be consolidated in a Gap Analysis template similar to the template that appears below. This template will provide a summary off all gap opportunities and needs. Barriers and benefits to closing the gap will also be identified in the template.

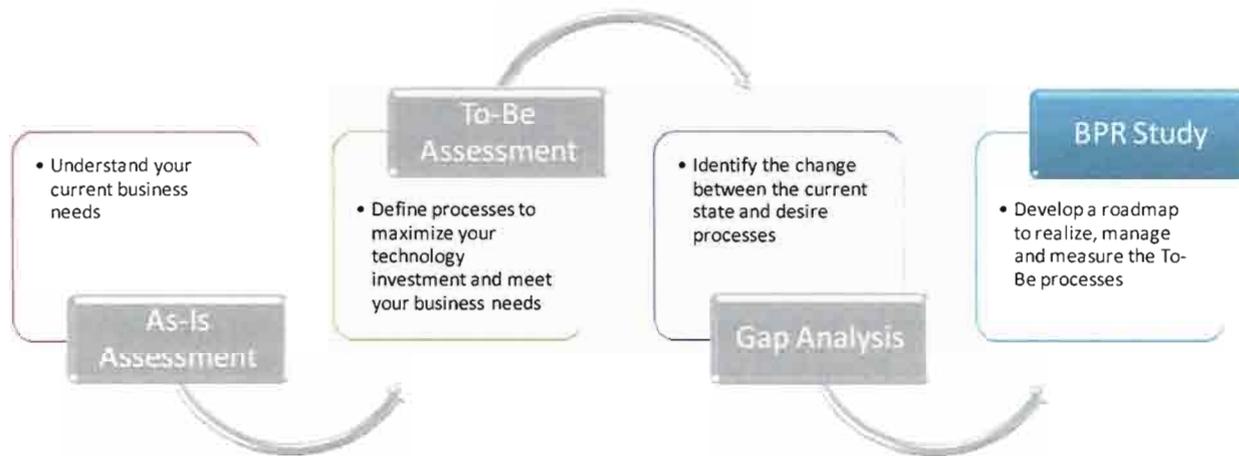

Figure IV-152: BPR Study

The final step in the BPR activities is the development of the Business Process Reengineering Study. The Business Process Reengineering Study will serve as a roadmap for the State to navigate the changes that will result from the BPR activities. This roadmap will provide workflow documentation and will address timing, resource requirements, dependencies, benefits, and constraints. Additionally, it will outline how workflow changes will impact technical staff, program staff, managers and executive staff through identifying duty assignment changes.

The objectives of the Business Process Reengineering Study are to:

- Provide an overview of the workflow documentation for the new processes identified in the Gap Analysis
- Provide a high-level roadmap for the State to understand how the workflow changes will impact current organizational structure to assist in proactively managing change
- Provide the information necessary to manage and sustain the changes
- Define a Benefits Realization Plan to monitor and measure the improvements over time

Description of the Business Process Reengineering Study Activities

Develop detailed workflow documentation. The goal of creating the detailed workflow documentation is to streamline and track the workflow activity based upon work stream and “day-in-the-life” scenarios. The BPR team will document the series of interactions that need to happen to complete the various tasks within each functional release for workers and system users.

Validate Workflows. The BPR team will take into account transitions, variables, work lists, duty assignments, roles, permissions, etc. to develop workflows that are both viable and doable. We will then validate in 2 work sessions, each lasting 6-8 hours.

Revise workflow documentation. We will revise based upon the input from the validation session.

Draft, Submit for Review and Revise Business Process Reengineering Study. Our team will draft an Organizational Recommendations deliverable, submit it for review, and update it accordingly.

Develop the Benefits Realization Plan. Starting with metrics captured in the As-Is Assessment, the team will propose target metrics based on industry benchmarks and Nebraska's business environment. The metrics will be chosen based on how accurately they correspond to the process changes, although availability of data will also be a consideration. The target metrics will include details regarding the method, source and timing for capturing each metric.

Business Process Reengineering Study Output

Particular emphasis will be placed on how to implement the new processes in a manner that will help the State sustain the change. Along with updated workflows, the Business Process Reengineering Study will identify the associated technology, people, and infrastructure recommendations associated with the workflows. These documents are particularly helpful in creating future training modules. This will provide the State with a complete picture of the new practices that will provide staff greater access to information, support decision making and institute more efficient and integrated processes.

The Business Process Reengineering Study will be shared with the OCM team to be used to develop the action plan for managing the organizational changes. It will also be used by the Training team to guide the development of the training plan and documentation. Combined, these teams will provide a complete strategy and action plan for carrying out the recommendations of the Gap Analysis.

BPR and Requirements Definition

During the last To-Be session for each business process, the Application Design team will participate in the To-Be/JAD session to begin to lay the foundation for translating the To-Be processes into detailed system requirements. In this session, the participants will be given an overview of the Joint Application Design approach and the required level of detail to support the requirements definition process.

The initial JAD sessions will begin to identify and classify requirements by type and organize them into meaningful and manageable groups. Establishing different types of requirements will also help team members perform subsequent design and BPR activities.

Our team will then classify requirements into six basic types:

1. Feature
2. Business Rule
3. Decision Table Requirement – included in RequisitePro for reference
4. Actor
5. Use Case
6. Supplementary Specification

Features, Business Rules, Decision Tables, Actors, and Use Cases will be loaded into Rational RequisitePro. Supplementary Specification will be captured in Microsoft Word, Access, and Visio for specific process changes. As the documentation of these requirements is completed, the To-Be processes and associated functional and system requirements will be validated with the State, and communicated to the OCM team. Information gathered during these sessions will provide general requirements, inputs, outputs, necessary data fields, and business rules which will be used to help identify the organizational impacts. A member of the To-Be team will participate in the first full day JAD session.

BPR and Organizational Change Management

Just as the BPR team will work closely to help refine and gather requirements, the BPR team will also be essential to the activities of the Organizational Change Management (OCM) team. The workflows developed by the BPR team will identify existing and changing processes to a level of detail that will allow sufficient understanding assist the prepare the organization for change.

BPR and Training

Implementation is comprised of cultural change management activities, training development and delivery, and site support during go-live. Because the BPR team will have unique knowledge of each of the business processes that are changing, this team will work closely with the Training team to help ensure implementation success.

The BPR team will work closely with the Training team to identify the staff and process impacts that will result from the implementation of *SmartPro MedEE* and identify high risk challenges that are in need of mitigation. This Start, Stop, Continue Report developed by the BPR team will allow the Training team to understand where the largest impacts of implementation will occur, thus allowing for the provision of more concentrated support in these areas.

Our BPR team's knowledge of the extent and nature of the process gaps and how they relate to each of the process within the department will be invaluable in completing training planning and activities. This support will include the identification of who needs training and what type of training will be required. Throughout the collaboration among teams, strong documentation will enable traceability from the current processes through requirements, design, and implementation.

Summary

Our team has many years of experience in successfully transforming health and human services clients through technology change and BPR. Our success has been built on leveraging industry leading tools and best practices and, most importantly, never losing our focus on collaborating with our clients so that they may continue to realize the benefits of BPR.

There is no substitute for proven BPR benefits. For example, in a previous engagement, our team and our client have achieved outstanding results from BPR related activities which culminated in creating new business units, issue workflow standards, and issue procedures. Given the importance of BPR and the potential for capitalizing on improvement opportunities, the State's role in the process is critical. Thus, our approach has been developed with the following assumptions:

- The Nebraska Department of Health and Human Services (Department), Division of Medicaid and Long Term Care (MLTC) executive leadership and management will be available for interviews and follow-up meetings to review BPR analysis and recommendations
- MLTC will contribute at least one full-time BPR team lead to the BPR team to facilitate timely decision making and knowledge transfer
- Subject matter experts will be identified during the project initiation and understand and accept the importance of attending BPR sessions which will be scheduled with as much advance notice as possible

In sum, we fully understand the breadth and importance of projects such as the Nebraska Eligibility and Enrollment Solution project. We also stand ready to serve MLTC and the State by leveraging our knowledge of health and human services, Medicaid and the specifics of the Affordable Care Act and our deep tool set and skills in BPR, the foundation for a modern streamlined solution.

vi. Organizational Change Management

The Bidder must describe its proposed Organizational Change Management Methodology, which will be the foundation for the Organizational Change Management Plan and how it will fulfill the Department's requirements while minimizing the disruption to the organization during the implementation of the EES. This Organizational Change Management Methodology must have a set of defined processes designed to assist the State of Nebraska and other stakeholders in managing change.

Wipro/IBM understands that the *SmartPro MedEE* project will create change for the Department and its key stakeholders. Department staff will have to learn new business processes and new technologies. External stakeholders will have new opportunities for accessing *SmartPro MedEE* via the portal. Wipro/IBM has a proven methodology that has been successfully applied to other system implementation projects such as Utah Medicaid Management Information System (MMIS) to help minimize disruption to the Department and help maximize the benefits from the new system.

In 2013, IBM was recognized as an IDC MarketScape Leader worldwide in organization and change consulting.

In 2008, IBM conducted a survey of over 1000 project managers across the globe to understand the role of organization change management (OCM) in achieving project success. We found that project managers who included OCM as an integral part of project execution doubled their success rate (defined as on-time, on-budget delivery of project objectives) as seen in Figure IV-153. We call these successful project managers "Change Masters."

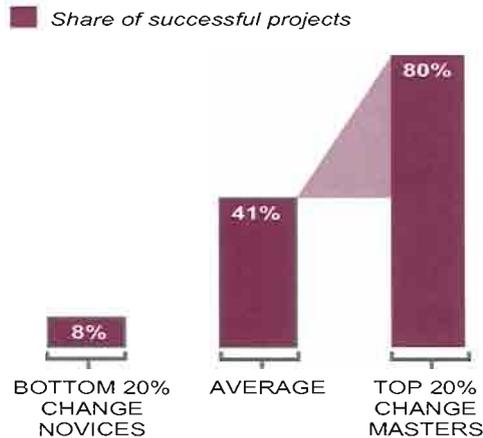

Figure IV-153: Change Masters Achieved Doubled Project Success Rates

Change Masters demonstrated four change-related focus areas to achieve higher success rates as shown in Figure IV-154. Wipro/IBM will leverage all four attributes to help the State of Nebraska *SmartPro MedEE* project team members become “Change Masters.” In the following sections, we will share with you how our approach to OCM will help the Department become “Change Masters” and apply these change-related focus areas to accomplish the *SmartPro MedEE* project goals:

- **Right investment, right impact.** We appreciate that the State recognizes the importance of managing change. We offer detailed plans and recommendations to help you determine the right level of investment of State time and energy to achieve project goals.
- **Better skills, better change.** We teach State staff our approach to OCM. Our approach is built on training and on-the-job mentoring so that the State has the opportunity to layer traditional learning with practice and coaching from an experienced change practitioner.

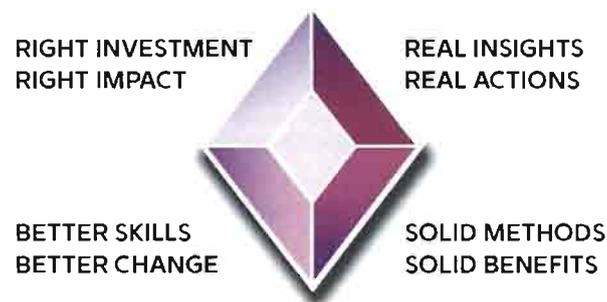

Figure IV-154: Four Attributes to Become “Change Masters”

- **Real insights, real actions.** Our plans are built on a robust understanding of the environment – the opportunities and the challenges – so that we can create the right plans and activities to achieve smooth adoption and approval of the new *SmartPro MedEE* and supporting business processes.
- **Solid methods, solid benefits.** Our Better Change method is maintained by a global community of practitioners who consistently incorporate new tools, templates and approaches and engage in a constant learning and sharing process to keep our skills fresh.

Better Change has been recognized as an industry leader and is the approach used within IBM to train our entire global community of project managers on OCM.

- a. Describe the approach to Organizational Change Management and the methodology that will be employed to assist the Department to envision the EES and document associated business processes;

The Wipro/IBM team will use IBM’s Better Change method as the cornerstone of its OCM efforts. The proven, robust, and extensive tools and techniques that comprise the Better Change method will help the Department realize the full potential of the *SmartPro MedEE* during each phase of the project. Better Change is structured around six enablers (the wedges of the hexagon) that drive toward meeting project goals. These activities range from the strategic to the tactical in focus. By using this method, we will help the Department:

- Gain insights and turn them into actions
- Make good use of method
- Leverage current skills to accomplish change
- Invest wisely in OCM to achieve the desired outcomes

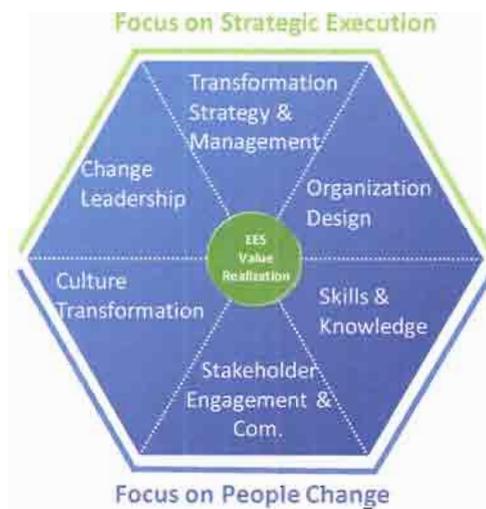

Figure IV-155: IBM's Better Change Method

At the center of the six enablers is the value realization where Wipro/IBM will measure the success of the project.

The enablers are each defined in Table IV-42: Enabler Descriptions.

Table IV-42: Enabler Descriptions

Method Enabler	Definition
Change Leadership	Builds and sustains support among project sponsors and leaders, and provides approaches and tools for governance mechanisms to promote project success.
Transformation Strategy and Management	Works to align the organization towards program objectives, covering relevant stakeholders and contributing initiatives, and managing dependencies and conflicting interests across the organization.

Method Enabler	Definition
Organization Design	Supports the State in aligning their organization with new or changed business processes resulting from system implementation. Addresses governance mechanisms to drive new behaviors supporting business results.
Culture Transformation	Enhance organizational performance by creating a shared vision of SmartPro MedEE implementation goals, designing and deploying interventions that align both the hard-wired (measurements, structures, processes, etc) and soft-wired (mindsets, business practices, behaviors) components, and managing the transition to a new way of working, thinking and behaving.
Communications	The main mechanism, prior to system go live, that establishes awareness and sets expectations among employees to prepare them for the organizational changes. Helps manage stakeholder expectations effectively using a controlled and consistent approach. An iterative process that involves analyzing, planning and implementing actions to build stakeholder support and commitment.
Training and Knowledge Management	Provides a framework to assess and implement required skills and knowledge in a client organization. The OCM team will use this enabler in coordination with the training and knowledge transfer efforts.
Value Realization	Enables the coordination of ideas and effort across program teams to identify, quantify and prioritize benefit opportunities.

Based on our understanding of your goals, we believe the OCM effort to support the new **SmartPro MedEE** effort will be built from all six enablers, as well as value realization. As part of Project Start-Up, we work with you to help you understand the activities and tasks that comprise each enabler, the robust tools and templates already designed, and to customize our plan of action to meet your needs. The activities identified in the following sections are drawn from all six enablers.

The following sections describe how Wipro/IBM will leverage Better Change during each phase of the project. The OCM team will work hand in hand with State staff to design and execute OCM activities that support smooth design, enhancement and adoption of the new **SmartPro MedEE**, and supporting business processes.

b. Describe how the methodology will [assist] in

Wipro/IBM’s approach for OCM utilizing the Better Change method will span the entire project lifecycle and cover key OCM activities including change impact analyses, gap analyses, organizational change readiness assessments, and workforce transition activities.

Each phase of the project demands a different set of OCM activities to support it. During the initial project phases, we focus on building a foundation that sets the strategy for the OCM effort and details the activities we conduct in subsequent phases. Before addressing how we will approach the specific activities described in the RFP, we describe what we will do for each phase of the **SmartPro MedEE** project. In the write-up for Phase 1, we spend additional time laying out processes or other evidence to support the effectiveness of our approach.

Phase 1 – Project Start-Up

Phase 1 is not only focused on project start-up but also on developing dynamic, tailored OCM plans and approaches. To achieve this, we complete a series of key activities to lay a foundation for change

management across the duration of the project to support effective adoption of the new system and new business processes.

The following sections identify how the activities that come out of each Better Change method enabler link to the various OCM activities.

Change Leadership: We begin with the **case for change**. A case for change starts with the answer to questions like:

- Why are we implementing the **SmartPro MedEE** system?
- Why does this implementation matter to me?
- How do we define a successful project?

By defining the critical success factors with **SmartPro MedEE** project leadership and change leaders during project start-up, the OCM team is able to share them across the project team and end users, building a strong case for change and developing a sense of ownership, interest, and even pride in the new system.

Once an understanding of the stakeholders is established, the OCM team designs a change champion network. This network is built from formal and informal leaders who serve as a principal communication mechanism between the project team and the staff impacted by the system implementation. We use the network to gather information, push out information and establish an understanding of the organization's readiness for change.

Transformation Strategy and Management: While the Project Management Office (PMO) is establishing overall project guidance, the OCM team:

- Supports a smooth launch by quickly building relationships with Department project leadership and team members
- Ensures the entire project team understands the case for change
- Reinforces the roles each project team member can play to help ensure successful adoption of the system.

Organization Design: At this stage, the focus is on the project team organization. We work with you to establish integrated OCM team roles and responsibilities. The integrated OCM team consists not only of our consultants, but also of State staff supporting the change management effort. By establishing the OCM roles and responsibilities during project start up, it is clear who must do what and when activities must be completed so that they are executed successfully on a timely basis.

Culture Transformation: We kick off with a Method Adoption Workshop to go through the Better Change methodology, and review tools and templates with State staff. We work with you to identify the specific activities and approach that will be most effective in the State environment and make needed adaptations. By involving State staff in shaping this step, we immediately begin the knowledge transfer.

Change Readiness Assessment: This assessment provides critical understanding of the Department's ability to successfully accept the changes brought about by the NE/EES implementation. This information gathered during this assessment will provide critical insight into the best ways to help manage the changes brought about by the **SmartPro MedEE** project.

Change Management Plan: This plan would act as an overall road map for the OCM efforts throughout the NE/EES project. The plan would identify the overall strategy, scope of work, high level schedule, roles and responsibilities, critical success factors, mitigation plans for organizational change management issues, business process improvement opportunities and stakeholder management activities that will be conducted throughout the project.

Communications Activities: To jump start the communication effort and create a baseline expectation with project stakeholders, we support the PMO in developing a project kickoff presentation. Following quickly behind the kickoff, the OCM team will conduct a communication needs assessment. This assessment identifies the appropriate communication channels for system stakeholders, ensuring that the OCM team and eventually the *SmartPro MedEE* OCM project team members are able to deliver messages that are pertinent and timely.

We also work with you to complete a Stakeholder Assessment and Analysis. The first step to this assessment is to identify both internal and external stakeholders to an appropriate level of detail and relevance. Once these groups are identified and documented, we gather information for this analysis by conducting stakeholder interviews and workshops to determine their key interests, their perception of the system change, their preferred method of communication (and key messages) and identify challenges or important expectations. The OCM team analyzes this information based on how the stakeholders are impacted by the change, what their reaction is to the change, and the degree of support that will be required by each stakeholder group, and it provides the foundation for a communication management plan.

In order to effectively manage the communication efforts, the OCM team develops a communication management plan to establish the overall communication strategy and make it actionable by driving the strategy down to the tactical level. Within the plan, the OCM team captures the overall scope of the communication efforts, the integrated project team's communication roles and responsibilities, the methods and channels for communication delivery, and a high level schedule.

Communication activities are an ongoing effort. Throughout the project lifecycle, the OCM team will develop communications together in order to maximize the knowledge transfer opportunities and to optimize the messaging for the audience. It is important that communications produced throughout the project life cycle carry messages at a strategic, tactical and personal level. Our process to communication development is illustrated in Figure IV-156: Communications Approach.

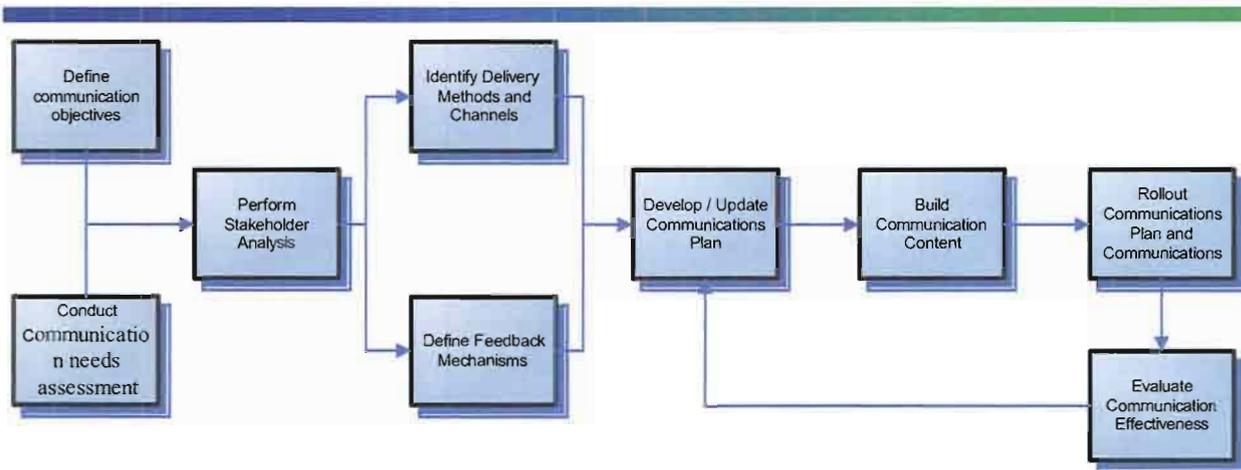

Figure IV-156: Communications Approach

Messaging starts with project sponsors and leadership providing valuable input that helps to make the case for change discussed earlier. Ongoing messaging from the top down with open communication channels that flow both ways are critical for success. By conducting and then acting on the communication needs assessment, the OCM team builds strong communication and feedback channels that branch out across the multiple stakeholder groups.

Part of building this communication network is monitoring the effectiveness of the communications and their delivery methods. As such, the OCM team conducts regular communication effectiveness surveys. The OCM team analyzes the results of these surveys and adjusts the communications and their delivery methods accordingly.

Phase 2 – Requirements Analysis

Once the foundational work has been completed in Phase 1, we move into executing the activities identified in our plans and working closely with the Business and Technical teams to understand how the State perceives change while it learns more about how the system will work.

Change Leadership: Once the Change Champion network has been established, we work regularly with them to keep our fingers on the “pulse” of the organization and provide information to staff. We also make recommendations for project and organizational leaders as to how their engagement helps secure resources, maintain focus and demonstrate commitment to the project.

Transformation Strategy and Management: Throughout the requirements gathering activities of Phase 2, we work with you to complete a change impact analysis. Change impacts are the difference between the “to-be” and “as-is” situations; this documents those changes in a structured and actionable way. The change impact analysis is helpful to understand the degree of change the organization and its stakeholders will need to undergo in order to achieve project goals. The OCM team’s understanding of the change impacts comes through participation in the requirement workshops with the State’s subject matter experts (SMEs) and stakeholders. The OCM team leverages the results of this assessment to further contribute to ongoing stakeholder analysis.

Organization Design: During requirements gathering we learn the organization’s “essential” design element. We begin to understand the difference between how the organization and its stakeholders

conduct business now and how that will change, and can develop initial recommendations on skill sets and business practices that will be essential for project success.

Culture Transformation: Requirements gathering also offers insight into the culture of the organization and current priorities and business practices. This is an important baseline for follow-on activities in later phases to shape new business practices.

Communication: By interacting with the stakeholders and SMEs, the OCM team continues to build on its stakeholder assessment conducted in Phase 1. This may drive changes to the Communications Plan. After updates are made to both plans, the OCM team begins its ongoing communications efforts, sending out messaging to the stakeholders through the communication channels identified in Phase 1 and updated in this phase.

Phase 3 – Design

In order to keep abreast of design changes that may impact the organization and the baseline change impact analysis, the OCM team participates and may help to facilitate design sessions.

Change Leadership: The role of Change Leaders is very important during design. Every project runs the risk that one of its groups will be disappointed when it does not get the design it wants. Change Leaders keep the organization focused on priorities and help those groups understand how they can still be successful even when the design was not their first choice. The OCM team offers talking points and recommendations on communication and engagement so that Change Leaders can keep those groups supportive of project goals.

Transformation Strategy and Management: Governance becomes an essential activity during design. We closely support the PMO through the process of identifying and resolving design issues, escalating for resolution as appropriate, so that the State's final design is closely aligned to its original vision

Organization Design: During Design, we link what we learned during requirements to the system design to understand the key process changes and make recommendations for how the organization should adjust. Recommendations may cover the organizational structure, job or role definition, or governance mechanisms.

Culture Transformation: After the design sessions, the OCM team supports the functional and technical teams with the development of draft user manuals, desktop procedures, and operation guides. As processes are finalized during design, we identify the business practices necessary to support the new system. Through many system implementations, we have learned that staff can easily choose between the “right” thing to do and the “wrong” thing to do; the harder choice is between two rights. We work with you to explore how “rights” can come into conflict in certain circumstances (e.g., the balance between cost efficiency, customer service and achieving process performance goals) and design training to help staff understand the desired business practices.

Communication: The OCM team is heads down during this phase conducting ongoing communications activities, to include sending out a Communication Effectiveness Survey. This survey is sent to a sampling of the stakeholders and establishes a baseline understanding of the efficacy of communications provided to various State staff to this point of the project; by conducting ongoing effectiveness surveys, the OCM team and supporting State resources can tailor the

communications to reach peak value over the lifetime of the project. Any changes identified because of the effectiveness survey are captured in updates to the Communication Plan.

Phase 4 – Development

Change Leadership: During Development, Change Leaders generate excitement and interest in participation during testing. We support the Change Leaders by developing talking points to share key points of the now-completed design and any updates to the timeline.

Transformation Strategy and Management: The Development phase is an excellent opportunity to revisit the change impact analysis so that it accurately reflects the completed design.

Organization Design: Once design is finalized, we finalize a set of recommendations on adjustments to the organization or job and role design to reflect the new way of doing business.

Culture Transformation: Throughout development, the CM team continues to support the functional and technical team with drafting system documentation, including the finalized Operations Guide in order to understand the ongoing change impacts to the organization.

Communication: We continue to refine and adjust communications based on feedback received through the communication effectiveness survey and to manage project communications to reflect accomplishments during this phase. The updated change impact analysis informs ongoing stakeholder communications.

Phase 5 – System Testing

Change Leadership: This is an excellent time for the OCM team to work with the stakeholder groups to understand the ongoing pain points and to energize the Change Champion Network to address the pain points and reinforce the case for change.

Transformation Strategy and Management: The OCM team supports the project testing team by developing test scenarios based on business process and system use cases. The OCM team will leverage its understanding of the State business processes and stakeholders to drive the creation of relevant test scenarios. This knowledge is based on the OCM team's work through the previous phases and the help it provided to the functional and technical teams as user manuals and desktop procedures are finalized.

Organization Design: During both System Testing and User Acceptance Testing (UAT), we look for opportunities to test or pilot organizational changes and identify human resource, labor management or other issues associated with organization design.

Culture Transformation: Both Testing phases are times to engage with the user community, not just as testing participants but also to deliver training on the new business practices. It provides context for the system training to follow in later phases.

Communication: As system testing kicks off, the OCM team ramps up the ongoing communications to the stakeholder groups participating in UAT. These communications are designed to excite the UAT testers about their opportunity to see the system and work with it prior to Go-Live. The communications continue to detail the change impacts and provide this understanding to the end user population. These communications also act as a form of knowledge transfer, helping to prepare

the users for what they will see when they interact with the new system. This circles back to the OCM team's work to help finalize the manuals and desktop procedures; the OCM team leverages these procedures to help build the relevant communications.

Phase 6 – User Acceptance Testing

Change Leadership: We work with Change Leaders to position them to generate enthusiasm and interest in participating in User Acceptance Training (UAT). They have an important role in discussing the results of testing and reinforcing the importance of the user perspective by highlighting changes driven by UAT.

OCM support of the UAT process is a critical factor in setting and understanding the expectations of the stakeholders. During System Testing, the OCM team will help the business and technical teams to create UAT scenarios for UAT and begin messaging activities to involved stakeholders and State personnel. During UAT activities, the OCM team monitors stakeholder feedback and adjusts any planning for future change management work, updating the Change Management Plan if necessary to reflect these changes.

Transformation Strategy and Management: The OCM team works across the stakeholder groups to balance participation and representation on the testing teams. By managing expectations, we help each group feel that they had a meaningful role in shaping the final system.

Organization Design: We continue to work through the implications of recommended organizational changes and prepare for implementation.

Culture Transformation: We continue training the workforce on the desired business practices so that they are ready for system training.

Communication: Based on what we learn during UAT, we share results with the broader stakeholder community to help them understand not only what worked well, but the adjustments the project team is making in order to bring the system in line with State needs. We continue to adjust the Communication Plan.

Ongoing communications continue heavily through this phase, gradually losing focus on testing and focusing instead on the upcoming implementation and go-live of the system. The ultimate goal of these communications is to provide for a successful readiness assessment when it comes to stakeholder readiness.

Phase 7 – Operational Readiness Assessment

Change Leadership: We work closely with Change Leaders to position the organization for the final push to implementation. Using the results from the Operational Readiness Assessment, we leverage their leadership to move the organization forward to close any readiness gaps.

Transformation Strategy and Management: The essential activity during this phase is the Operational Readiness Assessment itself. Leveraging templates we used on other projects, we tailor an approach that starts with the results of the change impact analysis (so we understand the magnitude of change for the affected groups) and then looks at readiness for the people, processes, the technology and other identified important resources. The Assessment itself crosses the Business, Technical and OCM teams. Examples of the kinds of questions we seek to answer are:

- Do staff have the information they need?
- Were the new processes communicated and trained on? Are job aids easily available?
- Is a support network in place? Are super users deployed across the organization and easily accessible? Is the help desk protocol well-defined and communicated?
- Have any necessary computer upgrades been completed?
- Can the IT network handle anticipated changes?

Based on the outcome of the readiness assessment, the OCM team quickly identifies and executes change interventions designed to address readiness weaknesses.

Organization Design: We work with the organization to identify and address any remaining challenges to implementing organizational design recommendations.

Culture Transformation: Part of our readiness assessment is an evaluation of the organization's readiness to adopt the new business practices. We recommend and support implementation of a set of adoptability and performance metrics to understand if we are "moving the needle" following implementation.

Communication: The OCM team focuses their ongoing communication efforts during this phase on understanding how ready the stakeholders are for the system to be implemented. As such, the OCM team folds their Communications Effectiveness Survey into the overall Project's Readiness Assessment. By understanding how effective the communications have been to date – and again, tuning communication to address the challenges of getting ready for a go-live - the OCM team understands stakeholders' feelings regarding the system implementation. The analysis of the communications effectiveness assessment drives updates to the Communications Plan.

Phase 8 – Implementation

Change Leadership: When learning a new system or a new skill, we naturally get slower before we get faster and begin to see the benefits. We work with Change Leaders so that they can help the organization understand that this is a normal learning evolution and to keep staff on track practicing their new skills so that they reach desired levels of performance.

Transformation Strategy and Management: One main focus for the OCM team is the team's support of the PMO to finalize the Transition Plan. While the majority of the Transition Plan focuses on the turnover of the system, it is imperative that OCM activities and communications continue on beyond the implementation and transition phases.

Organization Design: We support implementation of organizational changes and make recommendations to address issues and challenges as they arise.

Culture Transformation: Using the performance indicators established during Phase 7, we measure if we are "moving the needle" with regard to adopting new business practices and achieving performance.

Communication: The Operational Readiness Assessment from Phase 7 drives refinement of communication during the Implementation. We support an increased level of ongoing communication throughout the implementation phase, focused on providing stakeholders with go live information and further knowledge transfer and training opportunities.

i. **Assessing the impact of change upon jobs, roles, workflows and skill requirements needed to ensure successful deployment;**

Within the OCM phase approach described above, the OCM team will conduct a Change Impact Analysis aimed at assessing how the changes resulting from the *SmartPro MedEE* implementation will impact jobs, roles, workflows, and skills. Starting in the Requirements Definition phase, the OCM team will work closely with the Business teams to understand the current processes and the changes resulting from the future *SmartPro MedEE* processes. This analysis will allow the State to understand the degree of change the organization will need to undergo in order to realize the benefits of the system. In order to do this assessment, the OCM team will:

- Identify the change impacts by participating in the requirements sessions and subsequent design sessions. The team will work with the Business teams and State SMEs to fully understand the nature of the change. It will be critical to involve the needed stakeholders to accurately identify the scope and extent of changes.
- Document the changes according to the type of change, including change to jobs, roles, workflows, and skills. This documentation will be shared with other aspects of the project, including training, to help in the development of needed training, knowledge transfer, and testing scenarios.
- Develop Change Impact Action Plan that identifies the specific activities that should be done to manage the changes to the staff resources. The OCM team will work with each affected organization to ensure that the needed actions take place to meet the roll-out of NE/EES functionality, processes, and workflow.

ii. **Performing the Business Process Gap Analysis;**

The OCM team will work closely with the BPR team to identify and manage any process gaps. As described in Section IV.b.v, the BPR team will develop stop/start/continue sheets to identify how business processes will change as a result of *SmartPro MedEE* implementation. The OCM team will take that information and conduct a change impact assessment to determine how the process gaps will affect the people and organization. For example, will it necessitate changes to job roles, organization structures, governance, and/or skills. The OCM team will coordinate this analysis with the Training team in cases where new skills and training are needed.

The OCM team will develop recommendations for addressing the change impacts resulting from the BPR efforts. At a minimum, the recommendations include communication with the workforce to tell them how the processes are changing and how their jobs will change as a result.

iii. **Performing organizational readiness assessments; and**

The OCM team will conduct an organizational change readiness assessment to understand the ability of the organization to successfully achieve the changes brought about by the NE/EES implementation. In particular the change readiness assessment is a 'health check' that identifies, evaluates, and assesses the readiness of the Department and its key stakeholders to change. It gathers information on the current state, identifying actual versus desired characteristics to the organization's capability to change, gathering information on the risks, impact areas and resistance issues. The assessment gauges the level of awareness, understanding, and commitment to the NE/EES project and helps identify actions needed to manage stakeholder expectations.

The OCM team would conduct the change readiness assessment at the beginning of the program during the Start-up Phase to establish a baseline. The change readiness recommendations will be implemented during the life of the project with an additional assessment repeated prior to go-live in order to ensure readiness.

iv. Planning and conducting workforce transition activities

A critical activity in the Organization Design enabler is transition management to ensure that the organizations, functions, and people move in a planned manner from the current structure to the new, NE/EES structure. Successful transition is achieved by defining the transition strategy, planning the activities needed to implement the agreed strategy, developing an integrated plan with milestones and interdependencies, aligning resources to support these activities (and those of business-as-usual), and managing progress while implementing risk mitigation activities where required.

The OCM team will develop the transition management plan in two phases: defining the strategy and then developing a detailed plan to include tasks, duration, due date, resources and dependencies between the tasks. The transition activities will involve both internal and external stakeholders and will rely heavily on communications about the NE/EES project and the changes taking place.

c. Describe identification of any potential organizational issues anticipated with the implementation of the EES and describe how these will be addressed through its Organizational Change Management Methodology;

Throughout the project, the OCM team will continuously look to anticipate potential organizational issues arising from the NE/EES implementation. At project start-up, the OCM team will develop the Change Readiness Assessment that will provide critical understanding of the Department's ability to successfully accept the changes brought about by the *SmartPro MedEE* implementation. This understanding will allow the team to anticipate issues that may occur. The Change Management Plan will then outline the overall strategy and individual actions or efforts that will be used to address and mitigate these potential organizational issues. As an integrated part of the overall Wipro/IBM team, the OCM team will continuously evaluate and mitigate any issues that arise during the lifecycle of the project.

d. Describe the plans to evaluate the changes necessary to the Department's business processes in order to benefit from the EES being proposed;

The OCM team will work closely with the BPR team during the requirements analysis and design phases of the project to ensure that the benefits from the new *SmartPro MedEE* system will be enabled through needed business process changes. For example, we have found on other Medicaid system implementations, that individuals are very attached to handling paper and paper-based processes. Since most, if not all, paper-based processes will need to change in order to realize the benefits from a system like *SmartPro MedEE*, the OCM team will not only identify those needed process changes and also ensure that the individuals are ready and able to successfully do their jobs using the new system-enabled processes.

Through its Change Impact Analysis methodology described in section 4.2.6.2.1 above, the OCM team will fully assess the needed business process changes as well as understand the impact these changes will have on the people, organization, and workflows. This analysis will be used as the foundation for the Change Impact Action Plan that identifies the specific activities that should be done to manage the needed business process changes.

- i. **How will business processes benefit from workflow, business rules engine and/or content management be identified;**

Within the JAD sessions and captured in the Business Process Reengineering Study, the integrated project team will identify new business rules and workflows that will enable maximum benefit from the new *SmartPro MedEE* business processes.

The OCM team's focus during the as-is assessment process is to identify potential organizational issues and outline the steps needed to ensure the workforce is able to use the new business processes. The team will also help identify the right subject matter experts and decision makers are involved in the efforts to ensure the optimum workflow and business rule decisions are made. Communications will be a key element of these efforts so the workforce is aware of the changes and how it will improve the business processes.

- ii. **How will recommendations be made regarding changes to these business processes; and**

The future state processes developed during the to-be assessment phase of the business process reengineering efforts will be reviewed and validated with key stakeholder groups. The resulting recommendations will be included in the straw models developed in support of the to-be assessment. The OCM team will help ensure that the right stakeholders are involved in both the validation and approval processes by incorporating the results of its stakeholder analysis into the effort.

In addition, as outlined in 4.2.6.4, and in conjunction with the BPR team, a Change Impact Analysis will be validated with key subject matter experts and then be presented to project leadership to show the impacts of the business process changes on the people, organization, and workflows. Presenting these change impacts to relevant stakeholders will allow for useful dialogue between the State and the OCM team and will guide the plans for successful adoption of new business processes.

- iii. **How will the Contractor's organization and staff be used to implement these recommendations;**

The OCM team will be used to help communicate change findings and facilitate change recommendations through an active dialogue with relevant stakeholders. The OCM team, prior to go live, will establish awareness and set expectations among employees to prepare them for the organizational changes. Wipro/IBM will ensure that stakeholders' expectations are managed effectively using a controlled and consistent approach. It is an iterative process that involves analyzing, planning and implementing actions to build stakeholder support and commitment. This approach falls under the Stakeholder Engagement and Communications Strategy enabler.

- e. **Describe the staffing organization and how it will provide assistance to the stakeholders with regard to the identification and definition of their functional requirements;**

The identification and definition of functional requirements will be done by the Business Analysts during the as-to be assessment and the to-be assessment. This will be led by the business process reengineering efforts. The participants will follow the business process reengineering methodology

for identifying and defining functional requirements. The OCM team will participate during this process to identify key stakeholders and make sure they are included in the functional requirements identification and definition process. The Stakeholder Assessment and Analysis begun during the Project Start-up Phase will help drive the participation in this process. The OCM team will also ensure an appropriate level of communication with stakeholders about the functional requirements process.

f. Describe how the Organizational Change Management tasks integrate with Requirements Gathering, Business Process Gap Analysis and Training;

The OCM resources will be involved in the JAD sessions and the documentation developed from these sessions will be shared with the OCM team. A key result of the JAD sessions is to identify potential job changes and organizational pain points. In addition, the OCM team will integrate with the training team to identify areas where skills development and training is needed to help prepare the workforce to use the new processes and technology.

g. Describe how the proposed methodology will measure the results of a change

The OCM team will apply the value realization enabler to measure the results of change. The proposed methodology will measure the results of the *SmartPro MedEE* project through the amount of value provided by changes in such areas as business process, workflow, and user interface. Value realization enables the coordination of ideas and effort across the various *SmartPro MedEE* project teams to identify, quantify, and prioritize benefit opportunities. Value realization facilitates the development of a business case which is updated throughout the project life-cycle and which drives project decision making. Value realization assists in identifying benefit owners and engaging them in the project to develop and implement the plans necessary to realize and track value opportunities. The value realization process originates with identification of intended project values. It establishes a business case to document and quantify the benefits, costs, schedules, and assumptions required to implement the *SmartPro MedEE* project.

The OCM team will also be involved in value tracking, which goes past the project's implementation. The process should be focused on learning from experience and identifying new benefit opportunities to be enrolled in the value realization process. Value tracking occurs so that the client can confirm that the overall project is a success. Value tracking helps make the process of changing more concrete and target driven, which helps client organizations to make decisions and move on. It reduces the emotional influence which often stymies decision-making and value achievement.

In addition to measuring the overall result of implementing *SmartPro MedEE*, the OCM team will employ ongoing tools and techniques to measure the results of its OCM activities. These efforts will be included throughout the project phases and will take the form of ongoing communication effectiveness surveys and change readiness validations.

vii. Training

Describe our proposed Training Strategy, which will be the foundation for the Training Plan and how it will fulfill the Department's requirements while minimizing the disruption to the organization during the implementation of the EES

The Wipro/IBM team provides a blended training solution for the State of Nebraska *SmartPro MedEE* users and the Department's project staff involved with the rollout. A holistic training solution will be designed such that the required knowledge of the new solution will be an essential component the State of Nebraska Department's overall organizational environment.

The program includes training for 400 employees that perform Medicaid eligibility related duties throughout the State of Nebraska identified in Section I. Training of the RFP. The curricula for *SmartPro MedEE* users will be role based and the role will determine how training will be delivered to the user.

To appropriately target training, the Wipro/IBM team will work with the Department to define the number of employees who require training, by local office location and job category. Solution users will receive training on all aspects of functionality, features and benefits learning how to perform tasks efficiently within the new system in order to mitigate risks associated with inability to effectively service clients due to a lack of understanding of the new system.

To minimize the impact on the end users' day-to-day activities, role-based training and a variety of delivery methods will be used with targeted users. The Wipro/IBM team will design, develop and deliver a role-based end user training curriculum with input from Department staff. Training will be delivered using a blend of delivery methods.

To support the introduction of the new *SmartPro MedEE* solution into the Department's overall organizational environment, items such as ongoing availability of leading-edge training materials, skill competency lists, job role descriptions, and job evaluation criteria will be used to support this objective.

Our Qualifications

The State will benefit from Wipro/IBM's leadership in designing and implementing training solutions. We are very proud of numerous industry awards and recognitions from organizations such as Brandon Hall Training Research, Chief Learning Officer (CLO) magazine, and the American Society for Training and Development. IBM was named on TrainingIndustry.com's list of Top 20 IT Training Companies for the fourth consecutive year and has held a place in Training magazine's "Training Top 10 Hall of Fame" since 2008. IDC global market intelligence firm recognized IBM as the largest technical trainer in the world.

Figure IV-157: Industry Awards and Recognition

IBM has over 75 years of experience in training and is the world's largest training provider with over 3,000 skilled learning consultants and practitioners and over 10 content development facilities around the world. Our instructional design professionals possess deep experience designing and delivering blended training for complex implementations to large, geographically dispersed audiences. In the past three years alone, we developed and delivered hundreds of ILT, WBT and Webinar courses and over 165,000 hours of training to clients within the public sector (Army, Navy, Department of Energy, Veterans Administration, Customs and Border Protection, Michigan State University).

We practice what we preach and provide extensive technical, soft skills and project management training to our employees. IBM consistently invests in employee development as consultants and experts in their fields. One way IBM does this is by creating an environment conducive to learning opportunities and career growth. The IBM e-Learning portal hosts thousands of courses which teach everything from project management to technical solutions. An average of two weeks of technical or professional training per year is built into work schedules to foster learning. Skills development programs provided by IBM include regular attendance at industry and technical conferences, and long term and short term development plans that include project-specific goals, professional mentoring, and professional certification. As a result, IBM delivers the most capable and qualified personnel to our customer engagements and that same quality will be brought to the State's project.

Training Strategy

- a. Describe the proposed Training Strategy based on its understanding project goals, the Contractor's proposed solution, and the Contractor's own experience with comparable EES projects. The Bidder must propose a Training Strategy that is the basis for the Training Plan deliverable. The Training

Strategy must demonstrate that the Contractor has a clear and comprehensive understanding of the State of Nebraska’s training requirements, the training-related tasks that are needed to support this project, and the Contractor and Department roles in those tasks.

Wipro/IBM will develop a training strategy for the *SmartPro MedEE* deployment by applying IBM’s proven and award-winning methods and tools to design and deliver a comprehensive blended solution and end user learning experience that maximizes student retention and reduces time to competency.

IBM’s training methodology is based on the well-established ADDIE (Analysis, Design, Development, Implement and Evaluate) ISD (Instructional Systems Design) approach. Figure IV-158 shows the ISD phases and representative tasks that are performed in each phase. The tasks listed under each of the phases are representative and not all-inclusive.

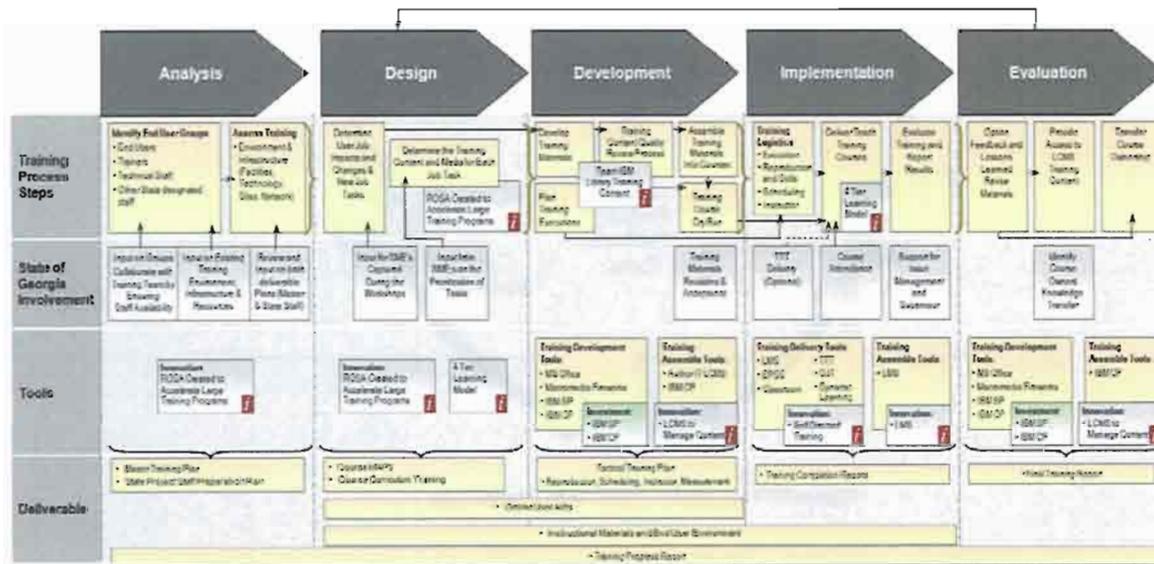

Figure IV-158: IBM's Training Methodology

IBM’s Rollout Strategy Analysis (ROSA) for cognitive and procedural task analysis and IBM’s Four-Tier Learning Model for media and instructional delivery selection are also proven methods that enhance the precision of the ISD process to help us achieve optimal results for the State of Nebraska’s EES implementation and are discussed in further detail in Section 4.2.7.2 – Proposed Training Methods.

We apply our training design process expertise along with thorough knowledge of courseware, industry standards, and adult learning principles to create programs to meet the widest range of learning such as visual, aural, verbal, physical, social, and intrapersonal. Our role-based curriculum approach will provide the State of Nebraska EES users with the training they need, when they need it, and in a manner that is least disruptive to their ongoing job responsibilities.

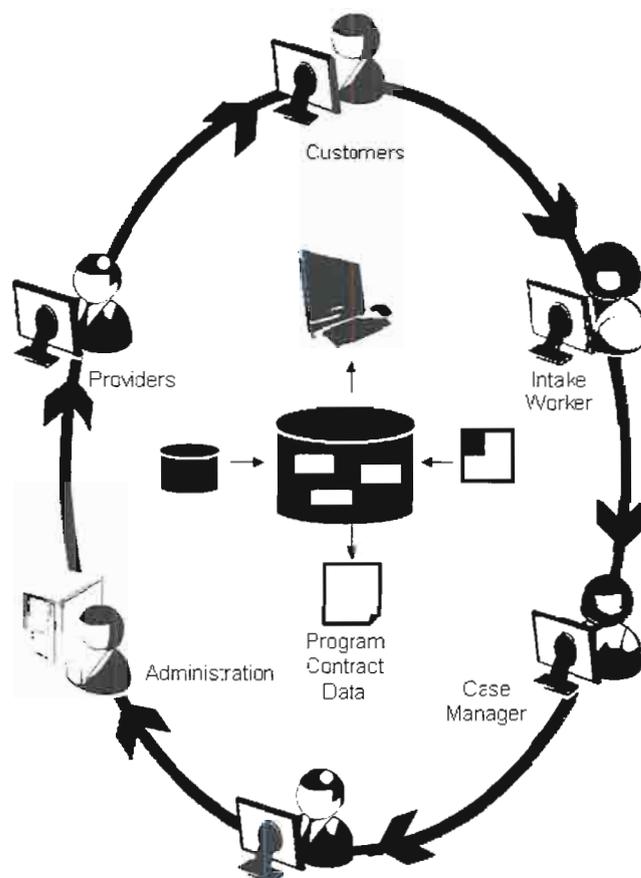

Figure IV-159: IBM's Training Methodology

Our experience in supporting numerous system implementations has resulted in several key observations about how best to prepare end users. We will incorporate the following into our training design as appropriate.

- Focus conceptual learning on business process and the desired outcomes – While learning to execute a task is important, adult learners need to know why it is important to do things in a new way and to understand their role in the overall business process.
- Provide on-the-job guidance for executing tasks – In class, end users will learn how to access and use the documentation they will have available back on the job. In addition to hands-on practice in class using a training database and exercises to gain confidence with EES, they also become familiar with the tools they will have later to guide them.
- Teach “a day in the life” – Adults want training to focus on their specific job roles and tasks, and they want exercises and practice using data that is representative of what they will use back on the job. This is the best way for them to transition what they learn in the classroom to what they do on the job. For this reason, our training design will concentrate on what end users will be expected to do in their specific jobs and the types of scenarios they will typically face.

The IBM team has successfully applied these insights on many successful case management information system implementations, including Colorado’s child welfare information management

system, Colorado’s Benefits Management System (CBMS), Ohio’s child welfare system, Tennessee’s eligibility determination system, Tennessee’s child welfare system, and California’s Case Management, Information and Payroll System II (CMIPS II).

Proposed Training Methods

b. Describe the proposed methods to be used to develop and deliver training to end users;

IBM will utilize its cutting edge ROSA and Four Tier Learning Model methodologies to develop and deliver innovative training to solution users

IBM’s ROSA is our method and process for instructional systems design used to enhance our ability to identify and map recommended training and support strategies, design learning that is targeted, useable, and blended, select the most appropriate learning strategies and delivery formats, prioritize training and performance support needs, and provide the right learning content for each job role using the best delivery approach. IBM’s ROSA has been successfully used at the Federal Emergency Management Agency (FEMA), U.S. Navy, U.S. Air Force, and Centers for Medicare and Medicaid Services (CMS). Recognizing that there may be multiple courses and training interventions required, the Training Design Document explains who, what, when, how, and why of each course and intervention. *(IBM’s ROSA is discussed in more detail in section 4 Training Plan.)*

IBM’s award-winning blended Four-Tier Learning Model has had proven effectiveness in the design and development of learning solutions. Each Department employee receives elements of each of the four tiers to create a comprehensive learning experience that maximizes student retention and reduces time to competency. The blended IBM Four-Tier Learning Model replaces or supplements traditional learning strategies and learning theory with real, applied “blended solutions” that match the type and level of learning experience required with the most appropriate training strategies and supports and establishes Industry Standard and Best Practices. In this regard, IBM may be considered and is viewed as a leader in blended solution design and development. Because the IBM Four-Tier Learning Model incorporates a large choice of learning interventions, Instructional Designers are able to analyze the organization requirements to determine the most effective solution using any number of these interventions to best meet the business, learner, and performance objectives. IBM’s Four-Tier Learning Model is depicted in Figure IV-160.

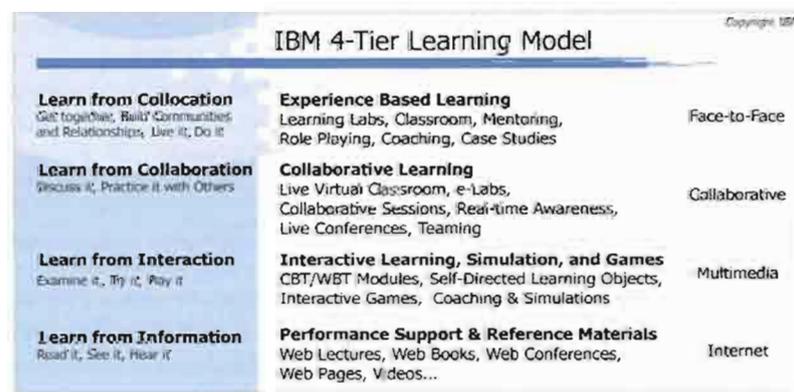

Figure IV-160: IBM’s Four-Tier Learning Model

IBM's enhancements to the ISD model yield a more robust training development approach for State of Nebraska's EES, the benefits of which are listed in Table IV-43.

Table IV-43: Benefit to the DCH's IES Program

ISD Method Phase(s)	Key Features	Benefits to the DCH's IES Program
Analysis	Analyze Learning Needs/Audience and Environment	Perform learning needs analysis by systematically determining goals, identifying discrepancies between actual and desired conditions, and establishing priorities for action. (IBM's ROSA and ISD Model)
Design	Advise on Learning Solutions	Provide advice and guidance on the various learning system solutions and options appropriate for closing critical skill gaps. Apply knowledge of current learning software, systems, trends, system standards, and independent learning systems vendors and products. (IBM's ROSA and ISD Model)
Design	Develop Learning Objectives and Course Structure	Create clear, testable objectives that serve as the primary guide in determining what you include in the content, whether the solution produces knowledge or performance, how the effectiveness of the solution is measured, and the media selected to deliver the solution. (IBM's ROSA and ISD Model)
Design	Apply Adult Learning Principles and Theories	Apply adult learning principles to create the learning experience. Perform according to key elements of effective adult learning including respecting the learner's: need to know why they should learn a subject or skill; need to share in directing their learning; need to bring their own experiences to the learning. (IBM's Four-Tier Learning Model and ISD Model)
Development	Apply Learning Facilitation Techniques	Apply learning facilitation techniques for a specified curriculum area in which the facilitator has specialized subject matter knowledge and/or practical experience. (IBM's Four-Tier Learning Model and ISD Model)
Development	Apply Principles of e-Learning and ILT Development	Follow these principles for developing e-learning and instructor led training, as appropriate to each: (1) Apply technical writing and creative writing principles to write the events of instruction that are included in the design of the course. (2) Apply creative writing strategies to write components that motivate students. (3) Write components and sequences using and adhering to the navigation design standards of the instruction. (4) Apply creative writing and test their knowledge whenever they want a progress check. (IBM's Four-Tier Learning Model and ISD Model)
Development	Apply Principles of e-Learning Design	Apply creative and theoretical concepts to design the primary components of e-learning. Apply principles in the design of learner interfaces that minimizes memory burden, minimizes errors, minimizes effort, and promotes features without interfering with learning the target skills. Design content structure and sequencing by defining what happens, how it happens, and when it happens. Design navigation that provides critical services, such as the ability to preview and personally assess what can be learned; determine how much has been accomplished and how much remains to be

ISD Method Phase(s)	Key Features	Benefits to the DCH's IES Program
		learned. Design interactivity that causes learners to think and tests their knowledge whenever they might like a progress check. (IBM's Four-Tier Learning Model and ISD Model)
Implementation	Analyze Learning Delivery Operational Plans	Collect the learning delivery data; analyze tracking reports; provide client with regular updates focusing on exceptions; and provide recommendations. (ISD Model)
Evaluation	Analyze Learning and Expertise Measurements	Work with appropriate executives to develop and analyze learning and expertise measurements procedures by determining what learning and expertise information is necessary to support business goal attainment. Periodically review measurements to ensure current relevance. Adjust measurements as necessary. (ISD Model)
Evaluation	Apply Learning Effectiveness Measurement (LEM)	The IBM Learning Effectiveness Measurement (LEM) methodology is a way of tying learning to business needs. Understand the LEM business strategy as it relates to engagements involving delivery of education. Understand and advise on the measurements associated with training and learning effectiveness. (IBM LEM)

Training Strategy Achieves Outcomes

- c. Describe how the proposed Training Strategy will achieve the expected training outcomes detailed in this RFP;

The Wipro/IBM team understands that learning is not one-time event. Learning is something that happens over time, on the job, during the course of normal work duties. Our training approach and suite of integrated training products are designed to address this reality. We design our training in modules that will allow users to build an understanding of the *SmartPro MedEE* solution over time. We deliver these modules in a variety of training products designed to facilitate the transition to the EES before, during, and after classroom training to encourage staff to become independent learners on the job.

Figure IV-161: Learning is Not a One-Time Event

Figure IV-161 illustrates a staff's typical learning curve and the kinds of training they receive as they become familiar with and effective using *SmartPro MedEE*. We have learned over many implementations that providing just-in-time training prior to implementation is critical but that inundating workers with too much information at the outset is counterproductive. Our approach supports learning experiences, within the context of day-to-day work activities where performance support has the most impact. Our philosophy also recognizes that adults are practical learners and busy people. Our training is based on practical, relevant performance objectives. We will guide the Department through a process to determine measurable performance objectives. These objectives will accurately reflect the skills workers need to master in order to be successful in the roles they fill in their counties. Our goal is to provide just enough skill-based instruction and user assistance, just in time.

Training Plan

- d. Describe how the Training Plan allows for a variety of pre-existing staff skills and minimizes the amount of time staff are away from the job;

The Contractor shall develop a Training Plan deliverable that addresses how the training needs of the EES users will be met, including but not limited to:

1. Different user groups;
2. Each user group's training needs;
3. The types of training proposed for each group;
4. The proposed delivery mechanisms;
5. The proposed training topics;
6. The proposed duration; and
7. Any prerequisites that need to be satisfied for users to be able to participate in training.

The Training Plan should provide training based on Department staff training needs including:

1. Instructor Led (ILT);
2. Web-based Training (WBT);
3. Computer-based Training (CBT); and
4. On-line Help, On-screen tips and Training Aids.

Plan Overview

During the Analysis Phase of the ADDIE method (described in Section 1 – Training Strategy) , the Wipro/IBM team develops the Master Training Plan (MTP). This plan serves as the blueprint for the overall *SmartPro MedEE* deployment training program. The MTP is developed in conjunction with the assigned Department Project Staff to help ensure that all EES requirements are fully and adequately addressed. The MTP answers at a high level the key training questions of who needs to be trained, when they need to be trained, where they will be trained, how they are trained, and why the training is required. In the subsequent Design phase of the ADDIE method, the answers to these questions and other elements of the MTP are further elaborated.

Conduct a training needs analysis. The first step is to know the intended end users of the solution. We use descriptions of job roles provided to us by the Department, to perform a training needs analysis for the diverse training audience/groups within the Department's offices. A needs analysis describes end users' skills, training requirements, and training content for job groups. In collaboration with the Department we analyze each job group and determine instructional needs for each role. This effort allows us to articulate course objectives that are job-duty specific and relevant to the end user.

Build the plan. The MTP is used primarily by the Department and the Wipro/IBM training lead to coordinate their user training activities. It also is a useful reference for all training developers and project stakeholders over the life the project. The MTP describes the approach to training the end users of the *SmartPro MedEE* solution. It describes the details of the training design, development, and delivery efforts in preparation for the implementation of the EES in accordance with the project schedule.

IBM's ROSA process is a key component for ensuring that the most appropriate training strategies and training support are provided in a format appropriate for each job role. During the ROSA process we identify each job role and the related processes and tasks performed by people in their day-to-day jobs.

IBM's ROSA informs the learning needs analysis by systematically determining goals, identifying discrepancies between actual and desired conditions, and establishing priorities for action. The needs analysis enables the MTP to accurately reflect users' learning needs and the roadmap for meeting those needs.

Using the ROSA tool, Wipro/IBM provides advice and guidance on the various learning system solutions and options appropriate for closing critical skill gaps. Knowledge of current learning software, systems, trends, system standards, and independent learning systems vendors and products is applied to inform the MTP and provide the most appropriate solution.

With ROSA, Wipro/IBM creates clear, testable objectives that serve as the primary guide in determining what to include in the content, whether the solution produces knowledge or performance, how the effectiveness of the solution is measured, and the media selected to deliver the solution. Figure IV-162 illustrates the inputs, major activities, and outputs of IBM's ROSA.

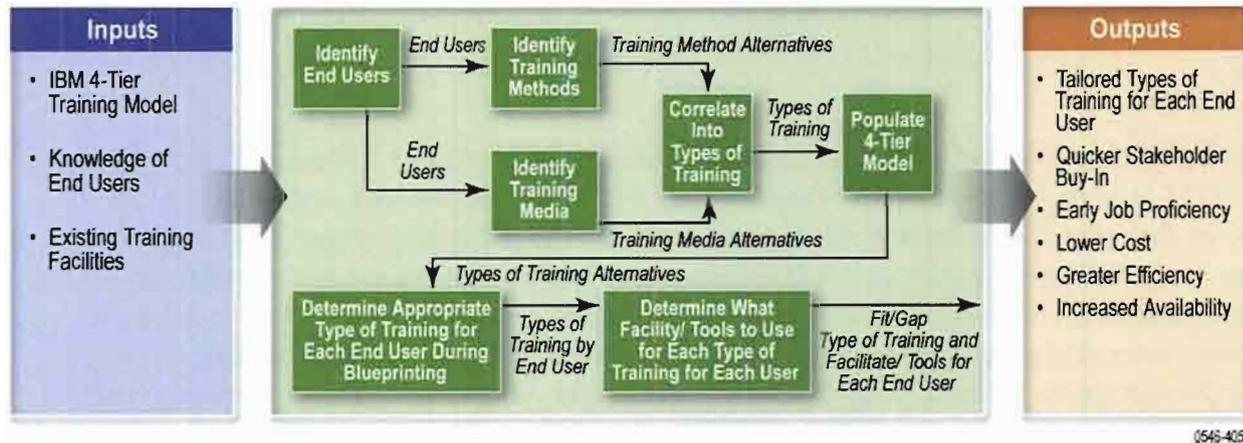

Figure IV-162: IBM's ROSA Approach Aligns Right Training to Right End User Group

To gather input for the ROSA tool, we lead collaborative workshops with the Department's project representatives to define and articulate the details of training curriculum design, development, delivery, and evaluation. The final plan will include the following sections:

- Plan overview
- Training methodology
- Roles and responsibilities
- Training work plan
- Target audiences/job role groups
- Multi-modal training delivery approach
- Curriculum and instructional materials
- Sandbox / training environment strategy
- Descriptions of planned training effectiveness evaluations and metrics
- Training schedule and logistics
- Personnel required to attend team training
- Communication strategy / plan
- Issue resolution process

Training Materials

The training materials will be maintained to reflect the latest version of the *SmartPro MedEE* and the changes resulting from evaluations and use during testing and implementation, subject to a training

materials release plan agreed upon by both the State of Nebraska and Wipro/IBM. On-line Help and Screen tips will be the help and screen tips that come with the IBM Cúram off -the-shelf application. The Wipro/IBM training plan does not include customizing these materials.

The Wipro/IBM team will design and deliver the following training materials:

Table IV-44: Training Materials

Instructional Material	Target Audiences	Benefits to the EES Program
Instructor Guides	Department Instructors/Trainers	Detail the steps, best practices and tips for delivering the Instructor-Led training Used by Department instructors to deliver on-going (sustainment) training
System User's Manual	Department Staff/End Users	Documents system procedures, screens, reports, forms and letters Non-technical orientation Emphasizes how EES features and functions support person-centered service delivery and program collaboration Explains how the system is used to support and implement Department policies
Online Job Aids	Department Staff/End Users; Clients	Online storage for easy retrieval and maintenance Quick access to commonly performed procedures Quick access to commonly referenced information Documents client procedures Can be printed
User tips	Department Staff/End Users (Recent Trainees)	Short messages with reminders about short-cuts, features, and other relevant information to promote end-user adoption and use of the EES
Client Quick Reference Guides	Department Staff/End Users	Quick easy access to commonly used EES functional areas

Training Delivery

The Wipro/IBM team will coordinate the delivery of training to support the *SmartPro MedEE* Implementation approach and schedule. End users will complete role-based curricula comprised of a mix of training methods designed to optimize learning and minimize disruption to the end users ability to meet their day-to-day job duties. The methods of instruction include:

Table IV-45: Training Delivery Methods

Method	Description	Recommended Uses
Web-Based Training (WBT)	Self-paced training, posted by State of Nebraska staff to the State of	Prerequisite training

Method	Description	Recommended Uses
	Nebraska's Learning Management System or a State of Nebraska web site and completed online	Foundation training Delivery to large, geographically dispersed audiences Just-in-time training Refresher training
Instructor-Led Training (ILT)	Training delivered by an instructor in person	Advanced or complex training Hands-on training in a live system In person discussion and collaboration with the instructor and other students
Online training materials	Job aids, user manuals and other documentation posted online by Department staff to a State of Nebraska web site	Just-in-time reference material Easy retrieval by end users and clients

Face-to-Face training will be the primary method of instructor-led training. This method is best for delivering advanced training concepts and where discussion and practice in the system are critical. Wipro/IBM will conduct a maximum of (7) classes, which consists of (8) hours sessions of instruction per class with a combined total of (64) hours with a maximum of 15 students per class, using training equipment provided by Wipro/IBM and facilities provided by the State of Nebraska. Wipro/IBM will be delivering the training from a central location. State of Nebraska employees will travel to that location to attend training if necessary.

Computer-Based Training Overview Modules

Wipro/IBM will develop Computer-Based Training (CBT) modules to provide a self-paced instruction that will serve as the single source of training for some roles and be combined with Instructor Led training for other roles.

The CBT overview modules will be Shareable Content Object Reference Model (SCORM) 1.2 compliant, so that that content can be launched and tracked from the State of Nebraska's LINKS Learning Management System (LMS) and be utilized as Web Based Training instruction. The CBT modules will be designed such that it will require students to achieve a mastery score on the student assessments of 95% or higher before being given credit for completing the course. If the student does not pass, the courseware will allow them to retake the assessment as many times as needed.

Web-based CBT. A Web-based CBT is a key component of our training solution. It can be available from Department workstations that have access to the LINK LMS taken whenever time allows, as often as desired, and reviewed as needed. The CBT course can be used to train existing staff during the rollout of a release and is always available thereafter for training new hires or existing staff who have new responsibilities. It can be provided to end users for whom classroom training is not necessary or practical.

The Wipro/IBM team provides up to eighteen total seat hours of Web-based CBT. The modules and lessons included are determined during the Analysis and Design phases of ADDIE and described in the training curriculum.

Our CBT provides the following features:

- *Task demonstrations*, enabling a learner to observe a task before practicing it
- *Software task simulations*, including step-by-step simulations that guide a new user through a procedure, and task simulations that require the user to perform the sequence of steps with minimal guidance
- *Knowledge checks*, which keep the users engaged in learning and assess their retention of key points
- *Pre-tests and post-tests* that keep the users engaged in learning and assess their retention of key points

By leveraging our instructional design expertise and employing leading simulation technology, we will produce a learning tool that will closely resemble the EES operational environment. This environmental fidelity will enhance the efficacy of the end-user learning experience.

The Training Menu Example figure contains an image of an IBM-developed Computer-Based Training course menu for the State of Ohio, which shows the modular, task-based design of the lessons.

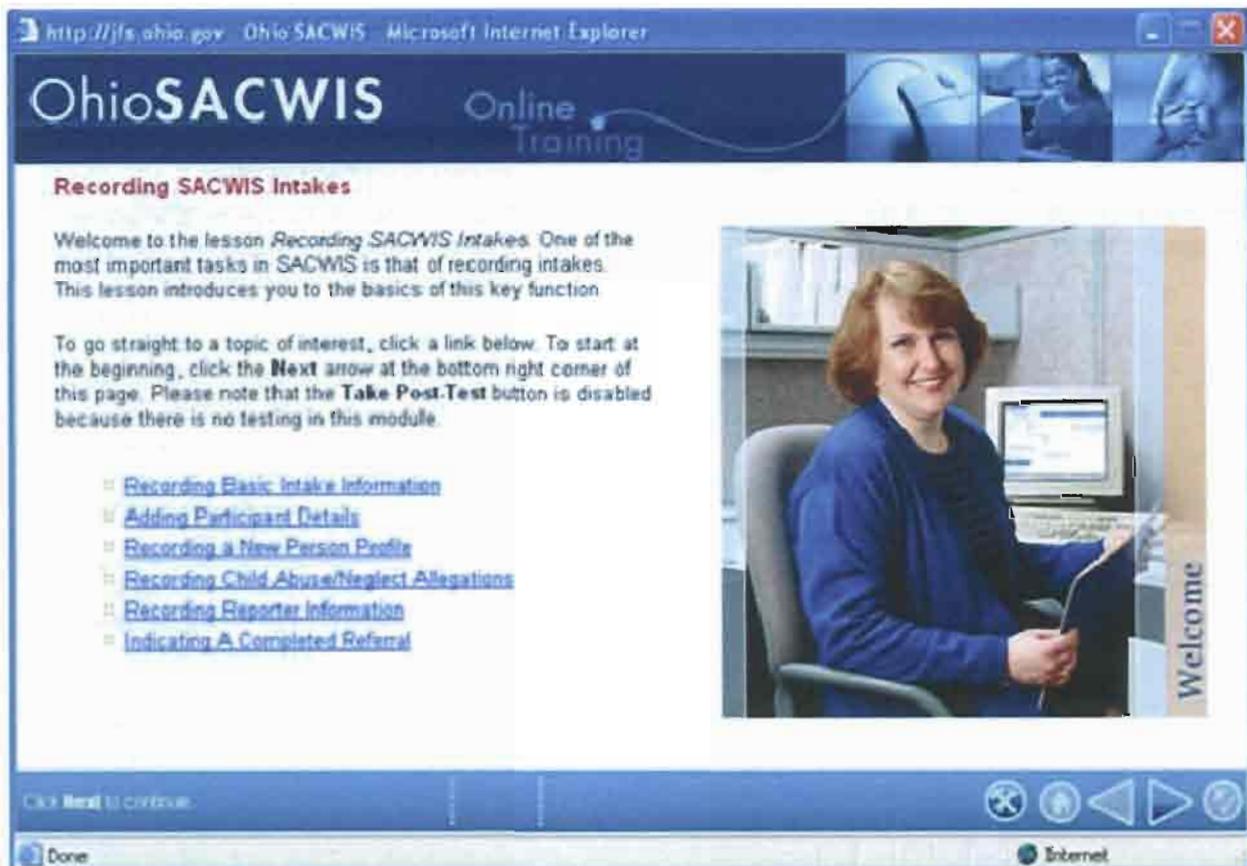

Figure IV-163: Training Menu Example

The Interactive Simulation Example in Figure IV-163 contains an image of an IBM-developed Computer-Based Training simulation for the State of Ohio. Simulations enable users to practice key system functions in a “safe” environment and receive performance feedback as they achieve learning objectives.

The Training environment is used during classroom-based training exercises and as a Sandbox for end users to practice their skills, test their knowledge, and gain confidence using the system under conditions as close as possible to being on the job, without the fear of the consequences of making mistakes on a live system.

Instructional Materials Development and Delivery

Wipro/IBM will furnish training materials, including training plans, agendas, slide presentations, training manuals, Computer-Based Training modules, , and quick reference guides to the State of Nebraska for review, feedback, and comments prior to commencing training. Wipro/IBM will provide master electronic copies to the Department project team, with copy and distribution rights, for all final materials.

Training Staffing Model

f. Describe the Training Staffing model and the skill sets of the training development and delivery teams;

The core of Wipro/IBM’s staffing approach – attract, retain, motivate and develop – enables us to deliver trained, motivated people for the State of Nebraska Department training tasks. The success of the *SmartPro MedEE* Training program is directly related to the ability to deploy, and retain a highly skilled workforce.

Wipro/IBM and its teammates employ a continuous comprehensive integrated resources management model for provisioning, retaining the workforce to support the State of Nebraska as shown in Figure IV-164.

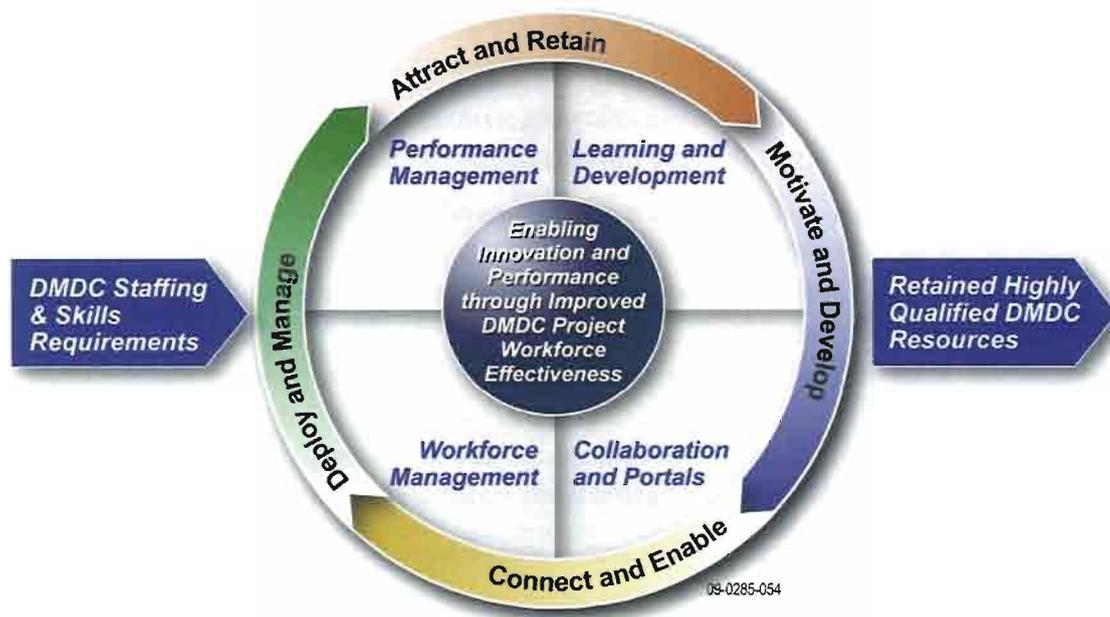

Figure IV-164: Team Wipro/IBM’s Integrated Continuous Resource Management Model

Though this integrated model, we are able to manage the talent lifecycle to:

- Create an agile workforce
- Fit the right skills and qualification to the job
- Foster innovation
- Strengthen employee competencies and depth of expertise
- Forecast and identify talent and skills
- Quickly deploy personnel

Maintaining 95% Competency Rate

- g. Describe how the Contractor will assess their training materials and training delivery staff to achieve and maintain a 95% competency rate for each course delivered by training delivery site;

Our primary goal is to deliver effective training. A goal of the Wipro/IBM team is to provide training effectiveness. During the Analysis and Design phases of ADDIE, we develop performance objectives relevant to the skills workers need to be successful using the *SmartPro MedEE*. We implement training evaluation measurement tools to evaluate the effectiveness of training both instructor-led and CBT.

While we work collaboratively with the State of Nebraska project members to define performance objectives for classroom training, we incorporate activities that allow instructors to check the progress and proficiency of the students during class and to offer additional instruction or clarifications where needed. For the Web-based CBT, we use the performance objectives to create pre-tests and post-tests, or knowledge checks, as part of the lessons. The Web-based CBT modules will be designed such that it will require students to achieve a mastery score on the student assessments of 95% or higher before being given credit for completing the course. If the student does not pass, the courseware will allow them to retake the assessment as many times as needed.

Additionally, the Wipro/IBM team develops the following training evaluation tools, which are implemented as online surveys on a platform provided by the Department:

- An evaluation that measures the worker's perceptions of the effectiveness of training, to be completed by the worker at the end of classroom training
- A form that indicates whether the worker successfully completed the self-paced exercises assigned during Day 2 of training
- An evaluation of the trainer's perceptions of training, to be completed at the end of each class
- An evaluation that examines how well workers retained the material and how well they can perform key tasks (as identified in the agreed upon learning objectives)

These evaluations and reports allow us to identify trends and opportunities for improving the training program.

Collecting and Reporting on Training Activities

- h. Describe how the Contractor will collect and report information on training activities on a throughout the system implementation training effort, including progress to schedule (classes scheduled v. classes actually held, total planned to be trained v. number actually trained); number and category of staff trained; and material covered; and

During the Evaluation phase of the ADDIE ISD method, the Wipro/IBM team will implement online training evaluations, conducted via an online survey tool and platform provided by the Department, and report on the activities identified in the Training Evaluation Test Plan. The Wipro/IBM team will follow proven methodologies for managing, delivering, tracking, and reporting metrics for training development and delivery activities and outcomes, including utilizing Dr. Donald Kirkpatrick's Four-Levels of Learning Evaluation: Reaction, Learning, Behavior, and Results.

After training is completed the Wipro/IBM team will submit a Final Training Report which will contain:

- Evidence that planned training sessions were held, or an explanation why they were not, attendance statistics, and other summary information
- An analysis of the difference between the pre and post training knowledge level and of trained staff using the system to satisfy daily responsibilities
- Evaluation of the readiness of trained staff to make best use of the new system
- Evaluation of impact on job performance and organizational training impact
- Recommendation and plan for closing significant knowledge gaps

In addition to the report, the Wipro/IBM team performs the following activities in conjunction with assigned State of Nebraska project staff:

- Identify and document training issues; collaborate on and track resolutions
- Plan, schedule and conduct meetings with the State to collaborate on recommended changes to instructional materials, improvements to the training approach, and curriculum
- Collaborate with the Department in the update and maintenance of curriculum and materials through the warranty period

Sample Training Course Map and Syllabus

- i. Provide a sample course map, training syllabus and courseware that demonstrates the quality of the current Bidder's training materials in the proposal.

The Wipro/IBM team has provided a sample Training Course Map and Syllabus that can be found in Exhibits and Samples 3.

viii. Knowledge Transfer

- a. Describe the Knowledge Transfer Strategy based on its understanding of State of Nebraska's project goals, the Contractor's proposed solution, and the Contractor's own experience with comparable EES projects;

Our team understands that the Department values the ability to be self-sufficient if required. Our Knowledge Transfer Plan is based on the foundational concept that the Wipro/IBM team is partnered with the Department's team to provide the consumers of Nebraska's Medicaid and Long Term Care services with a 21st century customer experience. With this in mind, we understand that our best avenue to success is to ensure that Department staff has as much knowledge as possible of our *SmartPro MedEE* solution. This knowledge makes us all better, as we are able to see the inside of the box to optimize our decision-making, which results in improved outcomes.

Wipro has established an enterprise wide Knowledge Management practice that provides an environment of continuous learning and productivity improvements to its employees. Knowledge Management (KM) is now a business process creating intellectual capital for Wipro.

Wipro as an organization is completely driven by strong people and quality processes such as People Capability Maturity Model, Six Sigma and CMMI. The Wipro KM Initiative has a strong leverage on our quality initiatives with involvement and commitment at the top management level.

The KM organization uses repeatable methodologies to continuously improve our knowledge-transfer skills. The diagram below provides an overview of our Knowledge Transfer methodology:

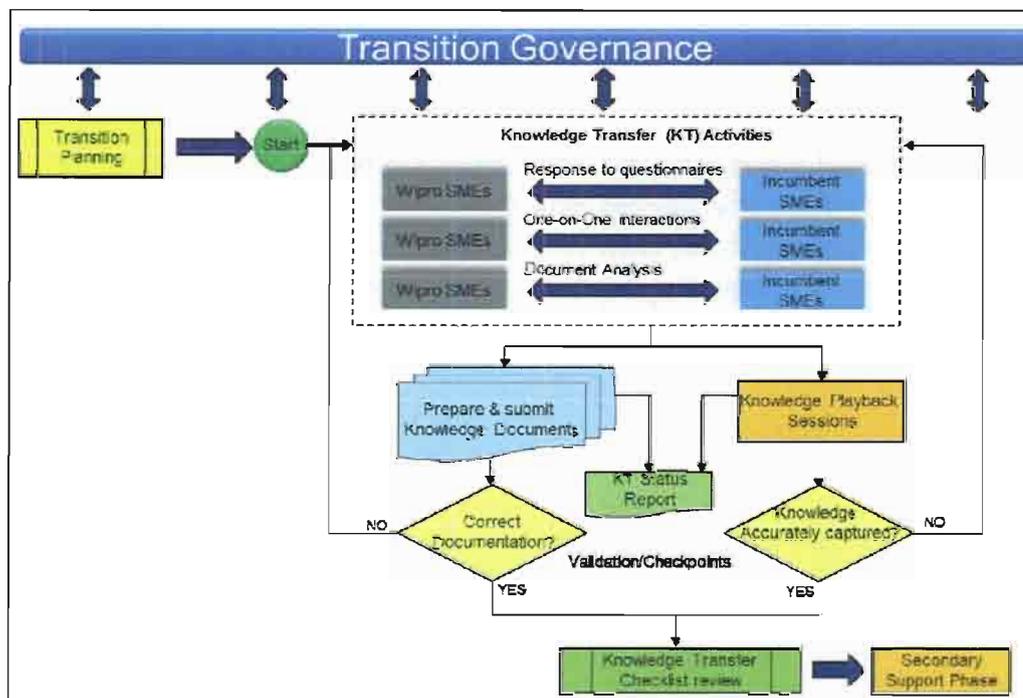

Figure IV-165: Overview of Approach to Knowledge Acquisition

The knowledge acquisition process is facilitated using the following methods:

- One-on-One interactions with SMEs through classroom sessions
- Computer-based training
- Lunch-and-learns
- Offsite classroom training
- Onsite classroom training
- Day-to-day conversations as MLTC and Wipro/IBM staff interacting daily and in close proximity to each other in a co-located environment
- Further, IBM has over ten years of experience in working with IBM Cúram customers on knowledge transfer. This knowledge transfer approach has enabled us to successfully start up new systems integrators with their first IBM Cúram implementations. At one point, each of our SI partners, was a new integration partner. We have also worked closely with the various customers to help them achieve self-sufficiency in implementing and enhancing IBM Cúram. Our methodology relies on classroom training for Business Analysts and Technical Architects and Developers and on project mentoring and consistent knowledge transfer. Our team will integrate key Nebraska staff into the project team, having them work alongside the project team in all phases of the implementation. An excellent example of the self-sufficiency and knowledge transfer approach of IBM Cúram is North Carolina where the state provides over 60% of the staffing on the project. Further, the North Carolina NCFast project director serves as the overall project director, coordinating the activities of the engaged SI, state staff and IBM Cúram.

b. Describe the methods to be used to develop and deliver knowledge transfer to State of Nebraska users;

As listed above, methods to be used to deliver knowledge transfer to the State include:

One-on-One interactions with SMEs through classroom sessions

Classroom training is taught by Wipro/IBM account staff that are intimately familiar with the *SmartPro MedEE* solution *and* have a working knowledge of the Department environment. This combination of subject matter and environmental knowledge allows our staff to tailor training to MLTC user groups.

Computer-based training

Computer-based training is created by account staff and supported by the Knowledge Management community. This training is customized to fit the needs of the Department and may include working demonstrations with voice over narration to describe the on-screen activities. This type of training may be especially helpful for individuals that have limited time to dedicate to classroom training. At the State's direction, this computer-based training can be create in or uploaded to the State's Learning Management System (LMS).

Lunch-and-Learns

Lunch-and-Learn training sessions are informal group meets that occur monthly or as mutually agreed upon with the Department and Wipro/IBM staff. These valuable sessions allow the "student" and the trainer to interact and dialog in a way that fosters open communication, give-and-take dialog and discussions that may be very wide or focused and or technical, depending on audience.

Offsite classroom training

Offsite classroom training involves Department staff attending sessions at an IBM or other facility and perhaps with other Cúram users from other parts of the country. These sessions are extremely valuable in that they allow the Department to interact with others, getting ideas about how to use the *SmartPro MedEE* solution and or even better policy to improve program operations and outcomes.

Onsite classroom training

Similar to offsite classroom training, onsite classroom training allows the Department staff to set aside focused and dedicated time to learn about a particular aspect of the *SmartPro MedEE* solution. These training sessions may include rules, workflow, business process and technical training topics.

Day-to-day conversations

The Wipro/IBM team intends to take full advantage of our co-located facilities to interact casually with the Department to affect knowledge transfer. The Department will find that our communication style is friendly, open and collaborative.

- c. Describe how the proposed Knowledge Transfer Strategy will achieve the expected knowledge outcomes detailed in this RFP;

The key to our knowledge transfer process is our collaborative approach with the client. The knowledge transfer strategy achieves expected outcomes by providing thought leadership with a sound and practical approach by tailoring the previously mentioned methods to the needs of each individual on the State's team. The Wipro/IBM team is ready and waiting to help the Department to become fully capable of assuming ownership of the *SmartPro MedEE* application, if and when the State chooses to do so.

To assess knowledge transfer effectiveness, the Wipro/IBM team will define subject areas, proficiency rating scores for each subject area and proficiency testing methods. Subject areas closely correlate with business process areas, as well as technical architecture and information architecture areas. This categorization of knowledge areas allows us to take a very deliberate and methodological approach to knowledge transfer. This approach ensures that we are providing knowledge transfer from the enterprise perspective, and factoring in all systems and processes required to achieve expected outcomes.

- d. Describe how the Knowledge Transfer Plan allows for a variety of staff skills and minimizes the amount of time staff are away from the job;

The Wipro/IBM Knowledge Transfer Plan allows for tailoring of the knowledge transition process to the individual. The Wipro/IBM team works with the Department to access the environment and customize our plan to meet your needs. As previously mentioned, some of the different types knowledge transition activities that can be used to reduce staff time away from their jobs includes informal lunch-and-learn training sessions and computer-based training activities that allow staff to accumulate knowledge when it is convenient.

- e. Describe the approach to knowledge transfer that will be put into place to not only ensure but to measure and report the knowledge transferred;

For measuring the knowledge retention and ensuring that it is in line with the account’s need, the Wipro/IBM team has created a KM Measurement Framework comprising five key indices:

- **Engagement Index** – measures unique users of knowledge assets
- **KM Users Index** – measures overall users of knowledge assets
- **Usage Index** – measures level of usage of knowledge assets
- **KM Contribution Index** – measures overall rate of addition to Wipro/IBM’s knowledge capital
- **Collaboration Index** – measures level of collaboration across the organization, including through social media

A KM Dashboard based on the above five indices is published monthly to the top management and account teams. The indices and their trends are shown for the entire organization as well as for each business unit in this dashboard. In addition, KM effectiveness is measured as a standard part of metrics at individual project level where productivity improvements and reuse percentages are measured. The table below provides more information regarding a Wipro client that enjoyed success with our Knowledge Transfer/Management framework.

Case Study 1: Wipro KM helps to Collaborate, Share, Easy on-boarding and retains robust Knowledge retention

Client	A leading Global bank with a global service delivery model
Business Situation	Account team wanted a provision to share knowledge and ideas across teams spread over different locations in order to enhance performance and higher customer satisfaction. There was a need for a central level platform for storing and managing all the account related information like account org chart, know your management, account induction / learning which could be accessed by all. A learning framework for new joiners was required to complete compulsory learning on the projects within a stipulated time.
How KM Helped	SHINE The KM team gathered specific requirements from the account team and proposed the ODC KM portal and SHINE (<i>Seek, Hands on, Interact, Network and Enrich</i>) framework to address their collaboration and learning requirements. Customer mandated learning’s were conducted through the SHINE framework. A new joiner took mandated courses through the framework and a mentee was assisted by a mentor (SME), as assigned by the Project Manager All these initiatives enabled a quick on-boarding KEDB KEDB (Known Error Database) portals for several projects were launched in SharePoint platform for faster resolution of issues.
Business Impact	SHINE Framework: <ul style="list-style-type: none"> • Helped the account to ensure faster on boarding to the projects. • Increased the resource availability on time as planned.

	<ul style="list-style-type: none">• As the framework is completely workflow based, mentors / SMEs bandwidth was made available for other productive activities.• Ensured proper report availability for the client and top management teams <p>ODC Portal:</p> <ul style="list-style-type: none">• Single point access to all account related information• Secure mechanism for storing account information• Project specific knowledge captured effectively• Project level measurement made easy through online Project RAG status <p>KEDB:</p> <ul style="list-style-type: none">• Significant defect reduction• Secure mechanism for storing account information
--	--

f. Describe in detail an overview of how the Bidder proposes to approach knowledge transfer for EES;

The Wipro/IBM team proposes to approach the transfer of knowledge for the *SmartPro MedEE* by first calibrating our expectations with those of the Department. This calibration activity is then documented and becomes an artifact that is managed within the project's configuration tool. As knowledge transfer requirements change, the Knowledge Transfer Plan is updated to reflect the new requirements.

As part of our Business Process Management methodology, we capture the As-Is and To-Be processes, as well as any knowledge transfer requirements associated with these processes. We also capture metadata about these processes including the suggesting knowledge transfer activities and timeframes. These knowledge transfer requirements are managed as part of the overall requirements management planning and processes.

g. Describe the knowledge-base and how it will be maintained to serves as a single "point of truth" for business rules; and

The Department will use the *SmartPro MedEE* solution as the central repository for business rules. The *SmartPro MedEE* application contains the business rules associated with eligibility determination, as well as other related business process. The presentation of these rules is very graphical in nature, allowing Department staff to easily understand the form and function of the rule and how to build and maintain rules on their own, if required. This approach to providing access to the business rules simplifies the process of obtaining access to the needed information.

h. Describe the methods which will be used to provide system documentation to the State of Nebraska and the methods which will be utilized to maintain the documentation.

System documentation is available in many forms, including documentation available on the IBM Cúram web site, as well as documentation that is specific to the Nebraska *SmartPro MedEE* implementation, created by Wipro/IBM staff and then uploaded to the Hyland document management system.

Our SDLC is utilized to ensure that all items under configuration management (including system documentation) is accurately considered as changes are made to the system throughout the life of the

project. As business process, technical and information architecture requirements change, these changes require updates to specific artifacts, including systems documentation. The required updates are managed under configuration through the development life cycle, and are implemented into a “production” environment at the appropriate time during the project, to facilitate and ensure that users have the information readily at hand to do the work.

ix. Reporting

The Bidder must describe in detail its proposed Reporting tool and how it will be used for the creation of operational and ad-hoc reports.

- a. Describes the mechanisms and methodologies that shall be built into the EES to allow the State of Nebraska to extract relevant information and build reports according to their specifications.
- b. Describe the Reporting Tool being proposed for all operational and ad-hoc reporting;
- c. Describe the tool’s scalability, ease of use, and features;
- d. Describe in detail the conversion strategy that will be used to convert historical Eligibility and Enrollment System reports into either a canned report or a newly developed report; and
- e. Describe the report tool training and knowledge transfer planned for State of Nebraska staff.

The Wipro/IBM team uses the Cognos and InfoSphere suite of tools to provide easy-to-use reporting capabilities to the State. The Cognos tool set includes Cognos Query Studio, Cognos Event Studio, Cognos Analysis Studio and Cognos Metrics Manager, The InfoSphere solution set includes DataStage which is used to Extract, Transform and Load all of the data required for reporting and analysis. These tools work together seamlessly and are accompanied by excellent support from the Wipro/IBM account team. The following section describe our reporting capabilities, including extracting data from the EES, transforming and loading the data into the *SmartPro MedEE* data warehouse and to creating user friendly reports with the web-based reporting tool.

Data Marts

The IBM/Wipro team creates data marts which hold data required for reporting and analysis. IBM InfoSphere DataStage® extracts, transforms and loads the data contained in the *SmartPro MedEE* application to the data warehouse. The Wipro/IBM team models the data mart so that the most complex transformations, summary tables etc. are created at the data mart level itself. These data marts are scalable and allow data from other sources to be integrated to meet additional reporting requirements.

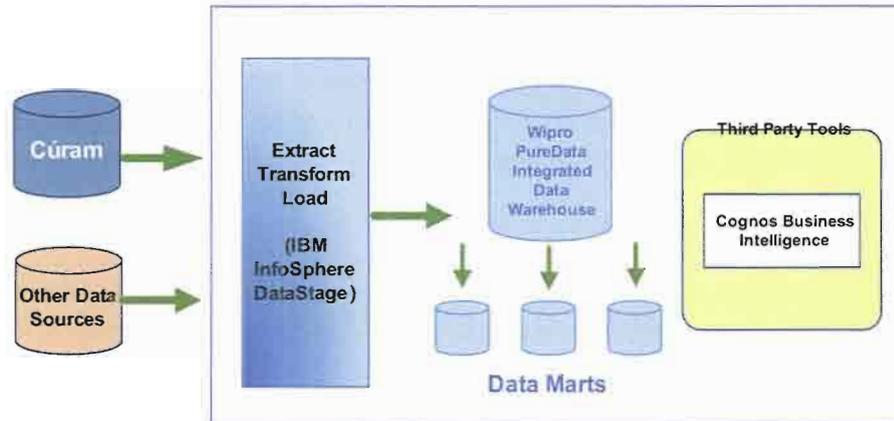

Figure IV-166: Reporting Architecture (High Level)

The *SmartPro MedEE* Business Intelligence (BI) environment, which is implemented on its own set of dedicated Virtual Machines, is supported by physical resources dedicated to BI engine Cúram. Master Data Management and other capabilities are supported on separate Virtual Machines and so will not be affected by the performance of the BI environment. Additionally, *SmartPro MedEE* will include a unified single BI gateway supporting artifacts like metadata and data lineage to give a better understanding of the underlying BI ecosystem. It will enable integrating other BI tools to get a single tool agnostic view of State's BI platform. Based on our understanding of the current N-FOCUS system, we know that there are a couple of data warehouses/BI systems that have already been built with other technology. If required, the existing BI artifacts can be integrated into the proposed portal environment to create a centralized BI repository.

The proposed environment will also fulfill the other key BI requirements like delivering reports in various formats for e.g., PDF, Excel, etc. The BI environment also supports versioning of reports, which is a standard Cognos (proposed BI platform) feature. Cognos also includes the functionality to provide automated report delivery mechanism. The data warehouse architecture is portrayed in the

figure below.

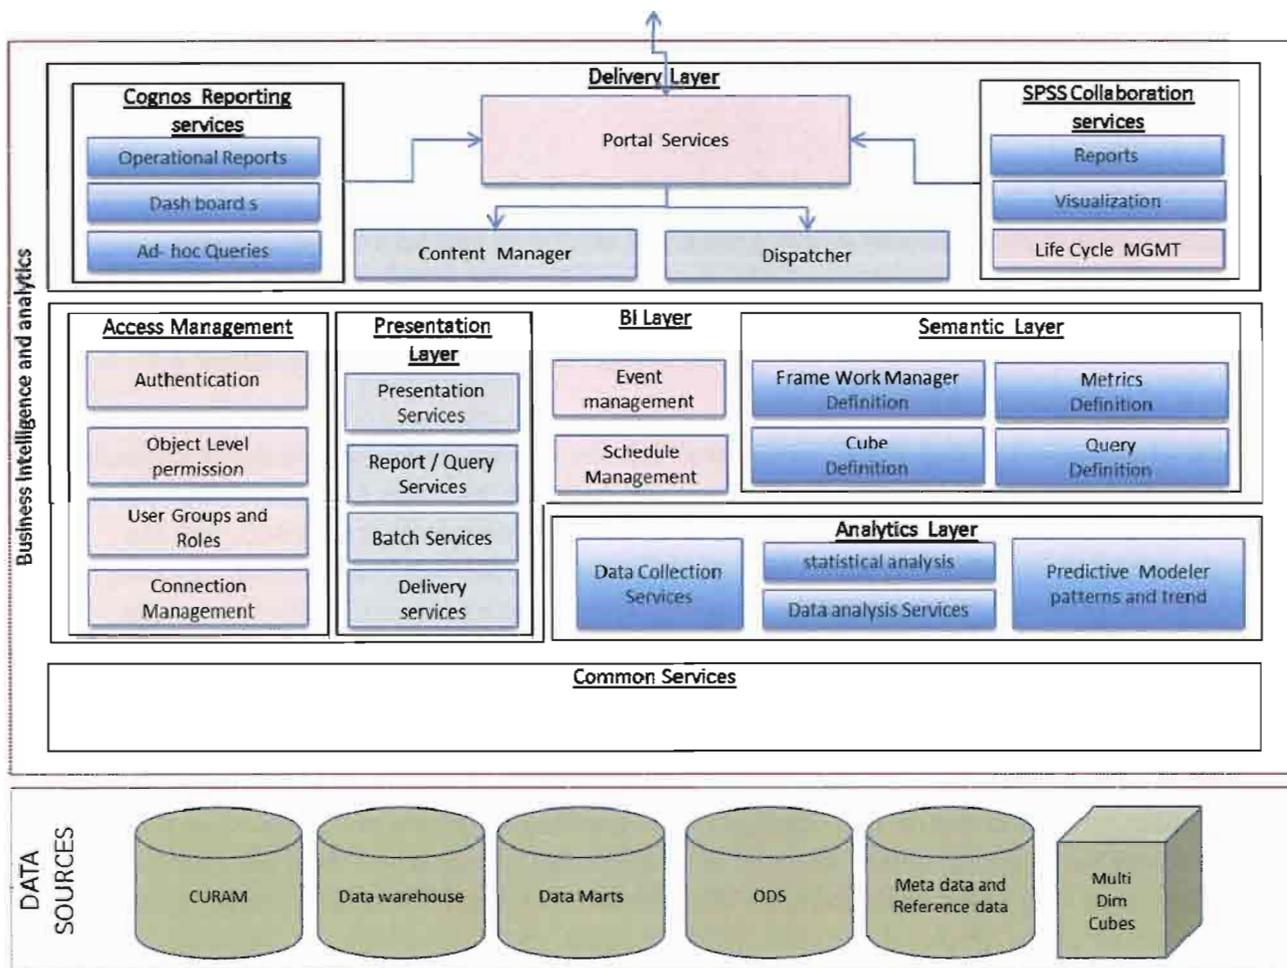

Figure IV-167: Information Delivery Architecture (Detailed)

A multi layered Semantic layer will be built using Framework Manager to abstract the technology complexity and bring more meaningful business terms for the measured KPIs. This Semantic layer brings a greater ease of use and understanding for the end-user community. The same semantic model will be reused and published in the portal for the power users and ad-hoc reporting needs.

The framework model will be designed with data source as the data mart. Multiple Framework manager models /packages will be built to support the business areas:

- Program Reporting
- Member Reporting
- Utilization Reporting
- Program Integrity Reporting
- Management reports

It is highly recommended to train the user community on the new BI tool (Cognos) from the initial stages of the project to manage the learning curve. Also the Wipro/IBM team will showcase wireframes and incorporate early feedback from State *SmartPro MedEE* BI users for them to get

familiar with the user interface (UI), as well as incorporate their feedback in the design and the re-development of reports. This will also provide a greater advantage in terms of quick realization of investment as well as easy and smooth adoption of the new environment.

Report delivery

The reporting/analytical product for producing reports will be the Cognos Reporting environment.

The Cognos Reporting environment allows a variety of users with various experience levels to produce reports, which can be used to make business decisions. The initial scope of the reporting practice will be using two components (Query and Report). Future stages will start incorporating the use of the other components (Analysis, Event, and Metric) as requirements dictate. Below is a description of each component.

Cognos Connection is the Web portal for Cognos . It is the starting point to access the functionality of Cognos . The portal is used to publish, find, manage, organize, and view business intelligence content, such as reports, scorecards, and agents. If you have the necessary permissions, you can access the various studios from the portal and use the portal for content administration, including scheduling and distributing reports, and creating jobs. Users view reports in Cognos Viewer, the report viewer. System administrators also use the portal to administer servers, optimize performance, and set access permissions. Within the Department user community, Cognos Connection is used by administrators and self service reporting users. Otherwise Cognos reports will be viewed through intranet.

Query Studio is the reporting tool for creating simple queries and reports in Cognos. Casual or novice users can use Query Studio to create ad hoc reports that answer simple business questions. Query Studio is an easy-to-use reporting tool. With minimal steps, users can author basic reports, change the report layout, filter and sort data, add formatting, and create charts. When you use Query Studio, you interact directly with visible data. This studio will be used by the Department's business/operational staff and any external users.

Cognos Query Studio enables users to build custom ad hoc reports to share with other Cognos users. Also, IBM® Cognos® Real-time Monitoring is an operational business intelligence solution designed to provide easy access to consistent data so you can react quickly to revenue and cost-saving opportunities. Cognos Real-time Monitoring features self-service, interactive dashboards with operational key performance indicator (KPI) measures for frontline business users, executives, managers and analysts. Cognos Real-time Monitoring features include:

- Self-service query, reporting and analysis from virtually any data source.
- Business-defined alerts about sudden issues that need attention.
- Patented memory-based data store for continuous data integration.
- Real-time data navigation that can help you investigate the root cause of an issue
- Drag-and-drop dashboard environment that enables you to add real-time, formatted information to your historical business intelligence.

Report Studio is the professional reporting tool for Cognos. It is used to author more complex reports. Report Studio offers greater flexibility in calculating and formatting results. Report authors can open Query Studio reports to create more advanced reports. Report Studio is a report authoring

tool that professional report authors and developers use to create sophisticated and managed reports. Use Report Studio for reports that are intended for a wide audience, exist long enough to require maintenance for changing requirements and data, and require detailed control over the appearance. Report Studio provides powerful functionality, such as bursting, prompts, and advanced charting, and provides many ways to customize reports. When you use Report Studio, data is not visible. You must run the report to view current data. Within State EES, the IT staff and some advanced Operations staff will use this studio.

Analysis Studio is the analysis tool for Cognos. Use it to explore, analyze, and compare Dimensional (cubes) data. Analysis Studio helps you answer business questions by finding meaningful information in large data sources. Managers and business analysts use Analysis Studio to explore and manipulate data so that they can analyze their business. Users can quickly analyze critical corporate data from any angle to understand why business events occur, and then make effective decisions. With analysis, it is possible to see trends and highlight exceptions that may not be evident with other types of reporting. Analysis Studio users can explore large volumes of dimensional data. When you use Analysis Studio, you interact directly with visible data.

Metric Studio provides a customized score carding environment to monitor and analyze business metrics required to support the Department's mission. Cognos Metrics Studio allows users to translate organization's strategy into relevant, measurable goals that align each employee's actions and accountability with a strategic plan. The score card environment of Metric Studio allows the Department to quickly identify performance within each business function. Metric Studio allows the Department to track performance against agreed-upon targets and indicates the current status so that decision makers at every level of the organization can react and plan. With Metric Studio, MLTC staff are self-sufficient and can readily and objectively measure how the organization is progressing against strategy. Staff can set priorities for actions and understand how decisions affect the performance of the Department operations.

Event Studio is the event management tool for Cognos. Use it to notify decision-makers in your organization of events as they happen, so that they can make timely and effective decisions. Event Studio ensures that critical information is detected quickly and delivered to key stakeholders in your business. You can create and manage processes that monitor data and perform tasks when the data meets predefined thresholds. By using Event Studio, decision-makers in your organization can be notified of business events as they happen so that they can make timely and effective decisions. Use Event Studio to create agents that monitor status changes, priority customers, or any other condition that is important to your business. When an agent detects an event, tasks are performed, such as ending an email, adding information to the portal, and running reports.

Required Security is built in the reporting layer so that only those users authorized to view the reports are given the access. Separate level of security will be implemented per the various categories of reports based on user's admin details, hierarchical level of the users etc.

Security is built in the reporting layer so that authorized users can only view reports they are authorized to access. Separate levels of security will be implemented per the various categories of reports based on user's admin details, the hierarchical level of the users etc. Please refer to our security considerations section for more details on security architecture. Both data level and report level security will be enabled.

Security includes both authentication and authorization, as described in figure below.

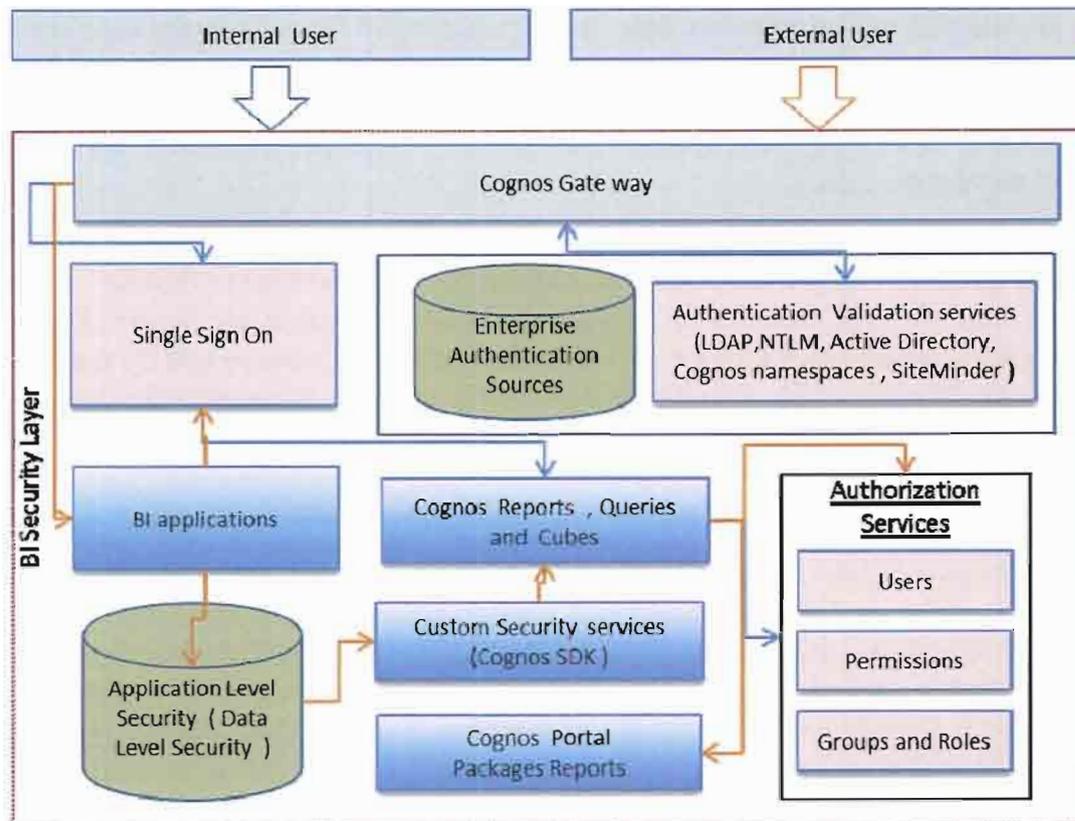

Figure IV-168: Cognos Security Architecture

Authentication is the process of securely validating a user's identity, and is generally associated with "logging on."

Internal users will be authenticated utilizing the State's LDAP system. This will ensure ISF compliance and enable SSO. The Portal Gateway protects the Cognos Portal URLs.

The Wipro/IBM team stores external user's authentication within each individual reporting application's custom security using data base / row level restrictions. To be able to authenticate external users a "view" of the stored external users user id will be available for Cognos to authenticate against. The "view" will require System Development Kit (SDK) development. The SDK provides the necessary Cognos and authentication source code to map internal groups and roles to the portal package, report studio and report run security.

The authentication login page will be available through each application to ensure ISF compliance based on each custom application's processes. Once authenticated, the user will be directed to a new Cognos Reporting environment portal URL created specifically for SDK routing which will require the SDK to send through the security namespace that will be used based on the application it is being routed from.

Authorization is the act of determining what capabilities and access an Authenticated User will be granted. Authorization will be role based. There are many levels of authorization.

User Type

This distinguishes the Cognos Reporting environment license user type:

- Consumer/ report user – can view, filter, schedule, notify, and drill pre-authored reports
- Author – consumer role plus can use Query Studio
- Analysis – consumer role plus can use Analysis Studio
- Manger – consumer role plus can use Metric Studio
- Remote Recipient – view reports from MMIS custom websites
- Object

This will state what specific objects the person through their role can view. This is accomplished within Cognos Reporting environment's security setup. For example, this would include reports that would be managed through public folder security and data elements that would be managed through the metadata/package security.

Content

Content security is down to the data 'value' level and will be managed within Cognos Reporting environment's security. For example, if a Provider can only see data related to their Provider ID, this would be accomplished through filters at the metadata, group, role, or user level, depending on the detailed requirements.

Vital Trust Data

Corporate Information Security Framework mandates certain levels of security based on the type of data content. For example, higher levels of security are applied to Vital Trust data versus General data. Each application has processes around the display and storage of their Vital Trust data based on the ISF compliance rules. Since these security rules are controlled within each application (based on the data), a security script will be written within the Cognos Reporting environment to recognize these rules i.e. who can see full text, masked text, or no text.

Data Visualization

The Wipro/IBM team proposes to use IBM® Cognos® Visualizer as it integrates easily with the Cognos BI and provides high impact visuals that deliver a quick knowledge transfer. The visualization engine leverages data from the data marts and DW. The different ways in which the data can be displayed for the State's users include the following.

- Geographical data (e.g. Utilization by Region) – Map
- Data over time , ratio data, comparison of linear data – Chart
- Trends, Outliers (e.g. Exception cases in Fraud etc) – Combination of line and bar graphs, control limits, etc.
- Snapshot data, single values (i.e. KPIs) – Gauge
- Multidimensional data - OLAP
- Other graph types for data presentation, including:
 - Pie chart
 - Side-by-side bar charts
 - Single and multiple line charts

- Tree graphs
- Probability plots
- Trend lines
- 3 dimensional graphs
- Parallel coordinates
- Control limits

Other common-use graphical presentation methods allowing drill down capabilities wherever required and possible.

The Wipro/IBM team will analyze the chart types; including swatch, value, parallel coordinate, box and whisker, gauge, histogram, thermometer, control limits, trend charts (and more) will fit in for data visualization in various dashboards and reports to quickly analyze various KPIs as well as allow the users to analyze the root causes of performance from different perspectives. Some other factors which will be considered include

- Correctly identifying KPIs suitable to be depicted in each dashboard and end users requirements from the dashboards.
- Multi-metric display: EES users are able to simultaneously see many metrics in an easy to understand visual formats and aggregate displays combining KPIs as well as allowing trends and connections to be easily spotted
- Interactive Exploration with drill down, rotation, zoom etc capabilities to focus on specific data points/patterns.
- Integration with Cognos BI platform

Visual Aesthetics and layout and Clarity : Logical and Fluent order and proper placements of controls, and various drill down options.

Management reports will be enabled by leveraging the pre-populated KPI's provided through the data model. The business requirements are grouped under business oriented subject areas .These will serve as the main entry point to enable reporting for business users.

The proposed BI environment will have appropriate operational, tactical and strategic KPIs to enable the below reporting requirements.

- Program Reporting, including a branch report
- Member Reporting, including County, Region and worker
- Utilization Reporting
- Program Integrity Reporting
- Business Intelligence Reporting

The State's requirements will be grouped under the subject areas. The KPIs will leverage the structured data dictionary that defines the business terms and phrases used in healthcare industry and the inter-relationships among those terms and phrases. A semantic layer enables some of the following key benefits.

- Represents the data requirements of a health plan
- Standardizes enterprise business terminology

- Is a business entry point to the data models
- Clarifies misunderstandings among lines of business and improves business-to-IT communications
- Is expressed in plain business language
- Is organized by subject areas
- Can be used as inputs and outputs of process and activity definitions.

Business terms and KPIs will be leveraged to be modeled into subject areas to enable business friendly ad-hoc reporting of data elements loaded from the Cúram database <RPT001, RPT029>

Subject areas help to group key health plan indicators and answer relevant business queries. They can also be leveraged for usage in dashboards, reporting applications and ad-hoc reporting. The subject areas provide an entry point from business to the physical implementation. Management reporting require reporting leveraging both subject area specific KPIs and also cross-subject area KPIs.

The Wipro/IBM team proposes to conduct workshops to identify KPIs across relevant business processes and finalize a comprehensive KPI list which will be leveraged across all management reporting. This is also expected to unearth/resolve discrepancies in terms of KPI nomenclature and interpretation across different business groups.

Supervisor Workspace provides supervisors and managers with dashboards to manage the cases (including households which are Integrated Cases) within their span of control that includes cases with issues. Cases for review will appear in their task list.

SmartPro MedEE, through Cúram Case Audit, supports configurable QC sampling, that enables the Department to sample by region or other grouping construct, perform random sampling, perform stratification sampling, and to sample by a wide variety of other criteria. Cúram Case Audit ultimately enables a user to configure an SQL statement, through a configurable field, which can select a list of cases using any filtering clause possible in SQL. Sample size, month or year of sample, can be used as filters through the above mechanism.

The **SmartPro MedEE** provides a mechanism to create the universe from which the system pulls samples. The universe will be the complete list of eligibility cases in the system. The sampling logic described above will return a sample list of case IDs.

The **SmartPro MedEE** solution, through Cúram Case Audit, supports a user role known as an "Audit Coordinator". An authorized audit coordinator can manually add cases to or remove cases from the sample. Comments can be provided to explain why changes are being made to the sample.

A history of case audits completed is maintained in the EES. Modification will be required to support the result categorizations listed here.

The Federal and State reporting is enabled through the data sharing architecture which will generate feeds in the required standard/formats. Federal and State reporting includes the ability to generate data and reports needed to apply for and demonstrate appropriate use of federal grant funding sources and will document the appropriate benefit programs, projects or other categories impacted by system or human actions to support claims for federal matching funds. The EES will also be able to differentiate funding source based on MLTC-specified criteria. The Cognos reporting also

includes HUB application status reporting, including pending reports based on citizenship. All information subject to the privacy act will be safeguarded and data will be encrypted before submission.

A metadata driven reusable extract routines will be built as a part of the State/federal reporting. All the reporting criteria for each external agency will be stored in this metadata repository. This approach will enable State to easily adhere to the State and Federal data requirement changes. The ETL extraction routines will use this metadata to build appropriate data sets and the same will be stored in a designated location in various formats including but not limited xls, csvs, etc.

The final list of reports required will be finalized during the initial planning and scoping phase. In addition, some reports are produced from within the Cúram application itself. One of these reports includes the Mass change processing report, which is performed via Cúram batch jobs that produce control and error reports as part of their standard processing.

c. Describe the tool's scalability, ease of use, and features;

User Interface

The User interface includes a simple, intuitive interface that is customizable. The User interface system has an open, extensible architecture that allows integrating almost any electronic resource via a portlet / web services. Basic Functionality that the user interface layer will cater to includes

- Processing of user-entered information
- Interaction with authentication and affiliation services
- Validation of input
- Submitting requests
- Retrieving and formatting results
- Directing UI process flow and display of pages or portlet components based on conditions such as data, clicks on hyperlinks, errors, user's privileges, etc.
- Establishment of UI sessions and storage and retrieval of session data

The environment is enabled with various delivery capabilities like query results exporting to various formats e.g. excel / pdf / HTML/ XML Report delivery can be enabled through email, printer or saving it to a predefined folder with data and time identified. Reports are generated on frequencies as per business requirements and the Wipro/IBM team will provide user manual explaining non-IT users how they can schedule new reports or re-schedule existing reports. The solution is built to scale to futuristic BI delivery needs like mobile based dashboards, office integration.

The *SmartPro MedEE* document management interface associates all documents and reports received with the appropriate case or case participant (person) so that they can accessed directly from the case file and be shared across programs and agencies with anyone with appropriate authority to view the case.

To generate an inventory of current and available reports, Cognos includes standard auditing features as well as an IBM Cognos SDK application that provides additional auditing, including Role Auditing, folders, reports, queries, etc.

Current Sampling methodology will be studied and Wipro/IBM's BI and Domain experts will provide recommendations on best sampling

d. Describe in detail the conversion strategy that will be used to convert historical Eligibility and Enrollment System reports into either a canned report or a newly developed report; and

The Wipro/IBM team will make sure that the existing reports, metadata and documentation is studied properly, a thorough assessment and gap analysis (with expected reporting BI functionality) is done and then the reports are designed and developed using Cognos .

The Wipro/IBM team proposes its report conversion approach that addresses the difficulties faced by both the functional as well as technical users. The major steps that will be involved in The Wipro/IBM team's approach to the existing reports conversion/migration are as follows

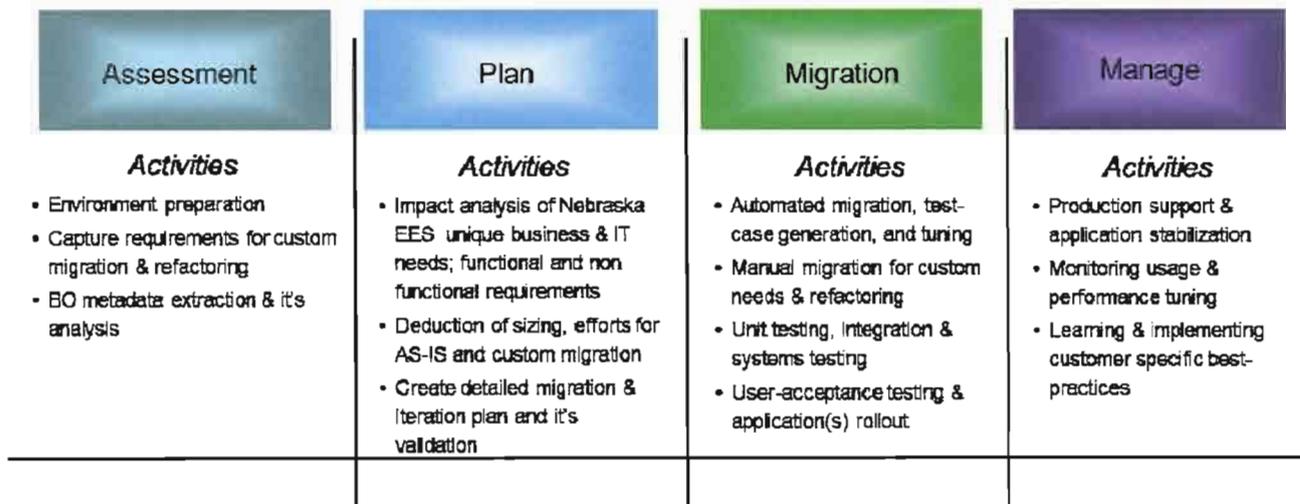

Figure IV-169: Salient Points of Report Migration Solution Phase and Components

Report Migration Approach

The Wipro/IBM team's development and implementation teams will go through two cycles of design, coding, unit testing, system testing, user acceptance testing and code deployment.

The advantages of an incremental delivery methodology are:

Frequent deliveries allowing users to work on the new reports as soon as they are developed

Business is able to see quickly the kind of end reports they will get and get used to the same and also provide feedback early in the project lifecycle.

Report Migration Testing Approach

As part of the testing that will be conducted within each increment, the Wipro/IBM team proposes to validate the following:

Technical Testing: This will primarily be a technology driven testing within which the testing team will validate the data that is displayed on the reports against the data that is available in the source tables. The testing team will validate record counts, data types, validity of aggregations, etc.

Functional Testing: This will be a business/functionality driven testing within which the testing team will validate the integrity of the data that has been loaded in by executing key functional pieces within the target environment.

Cutover Strategy

Cutover refers to the process of switching over from the current set of reports to the new reports developed in Cognos. Cutover from one tool-set to another often is prone to risks especially in such a scenario where the tool is already serving a purpose in production.

The different cutover strategies include:

- *Parallel Run:* This is an option in which both systems are maintained side by side
- *Cold Cutover:* In this option, the existing tools are pulled out and the new tools are plugged in
- *Pilot Runs:* A small section of the user group is exposed to the new tool and based on feedback received and the stability of the system, it is rolled out to the larger audience.
- *Report Migration Approach* (that is which reports will be covered in which iteration) and The cutover strategy to be implemented will be finalized during the Project Planning Phase.

e. **Describe the report tool training and knowledge transfer planned for State of Nebraska staff.**

The Wipro/IBM team will develop a robust training solution that will be aligned with the learning needs of the various target groups. Custom training programs will be created to meet State BI users specific training requirement.

The key aspects considered for finalizing the BI training solution will be as follows:

- *Training planned before and during User acceptance Testing* – Training will be provided weeks before and during the User Acceptance Testing so that business users spend optimal time from their day-to-day activities and whatever training they receive can leverage and test during the UAT period
- *Training road maps for users* – There will be role based training road maps designed for the business users, Power users and Data Administrators.
- *Instructor Led Training (ILT) approach* – Training will be delivered to the users in classrooms/space provided in State’s Office to equip them with the required knowledge and skills to use the new system.
- *Training materials* - The training materials to be used by the instructors to deliver the training will be designed and developed by Wipro/IBM team.
- *Self-Paced Learning approach* – In addition to classroom training, *Self Paced Training content* will be designed to provide an overview and reinforce key takeaways from the classroom in a self-paced mode.
- *Recap and Quiz* – Quizzes might be designed for each class room session and web based training to check the understanding of the users.
- *Training aides* – Work Instructions, Job Aids and Quick Reference guides will be created for various target groups to support the users during training

x. Documentation

a. Describe how standards to be applied for the development of documentation will be identified.

The Contractor shall establish and utilize documentation update procedures, including Meeting Status Reports to ensure that the EES documentation remains current at all times. The Contractor is responsible for the design, drafting and maintenance of all Department approved EES documentation deliverables. The Contractor is required to upload and maintain project, system, and operations documentation in the State of Nebraska Document Repository. The Contractor must provide a complete copy of all system documentation prior to going live. At a minimum, the Contractor must provide the following documentation deliverables:

- a. Data Dictionary;
- b. COTS Manufacturers' Documentation;
- c. COTS User Manuals;
- d. Technical Operations Manual;
- e. System Administration Manuals;
- f. System Standards; and
- g. Standard Operating Procedures.

The Bidder must provide a narrative overview of how the proposed solution will meet the Documentation requirements. Please provide specific details of the proposed approach to meeting the State of Nebraska's requirements. Also, include a sample of documentation in your proposal.

Describe how standards to be applied for the development of documentation will be identified.

The documented knowledge base will undergo continuous updates, changes, distribution and relevance checks throughout the lifecycle of the engagement. This requires documented procedures to be established to define necessary controls applicable throughout lifecycle of a document. There are six key control areas that will be established as per ISO-9001 standard:

Control Area	Description
Document Approval	Documents must be approved by authorized personnel for adequacy prior to issue. This will involve review of technical content of the document. It will also involve review of the document for compliance with applicable standards and templates agreed. As a rule, document approval will involve at least two stage reviews by Subject Matter Expert and a compliance review to ensure required standards are met.
Review and Update of Document –	Documents will be reviewed and updated as necessary and will be re approved as per controls defined above. The review will ensure currency and applicability of the updates to the document incrementally and the document as a whole.
Change and Status of Document	Any changes to the document will be identified and a traceability of the change will be maintained. This control will also reflect type of change to the document. This requires that the current revision status in terms of published date and version number to be identifiable.
Relevance and Availability at Point of Use	This control mandates that relevant versions of the document are available at their point of use. The versions distributed and the access control of users of document will be factored into the system. Controls for external users of document (e.g. sub contractors, other functions) will also be controlled appropriately in

	the system.
External Documents	Documents of external origin that are relevant to the quality system, and so content and Standards will also be subject to the same controls as internally generated documents. This includes distribution controls.
Obsolete Documents	This control requires that organization must prevent unintended use of obsolete versions of documents. Such obsolete versions of documents will not be retained in the Document Management System unless specifically required by the business needs. Controls will be established to identify obsolete versions of documents if they are retained for any reason.

Describe how document specification templates will be used to establish agreed-upon outlines for each document type;

Wipro/IBM will produce Deliverable Expectation Documents (DED) for each deliverable. These DEDs describe the format and content of each deliverable and will be provided to the Department for approval. Each DED will contain:

Cover letter;

- Table of Contents with a brief description of the content of each section;
- Anticipated number of pages; and
- Identification of appendices/exhibits

The Department will review each DED and provide feedback that will be incorporated into the final deliverable. The DED will contain a feedback section for review comments. MLTC will provide comments within a mutually agreed timeframe and as described in the attached Work Plan.

Describe how documentation to be produced by the process will be identified

Documentation produced by the process will be identified using a Master Document Control Number (MDCN). The MDCN will be linked and cross-referenced to requirements contained within the Rational Team Concert (RTC) requirements repository.

Describe how design, content and publication of documentation will be consistent and standardized

Documentation will be controlled by Wipro/IBM staff responsible for document quality control. These individuals are responsible for identifying errors in the document. Initially, the document is reviewed by team peers and leadership to ensure content is in the right template is relevant, clear and communicates the appropriate message to the intended audience. The document is then reviewed by an editor to ensure that the document conforms to appropriate style guide and that the document contents are syntactically and grammatically correct.

Document publishing consistency is enabled with the use of RTC. RTC provides for automated workflow and approval processes to automate documentation reviews. Using this automation, the Wipro/IBM team promotes consistency in the document publishing processing.

Describe how documentation will be kept current and that errors are found and corrected

Once documentation is created, it is kept current through a document configuration management process facilitated by RTC. During the Operations and Maintenance phase of the project, these

documents are associated with requirements, and are managed in the configuration of artifacts required to be created, updated or deleted as a result of the functional and non-functional changes that are included within the scope of a given project. Additionally, if errors are found with the documentation unrelated to a project, MLTC *SmartPro MedEE* Help Desk will be contacted to log the problem using the ticketing system. The Wipro/IBM team then updates the documentation using the ticketing system workflow.

Describe how documentation will be stored in the State of Nebraska's Document Repository and available to authorized staff

Interfaces are built to connect the RTC with the State of Nebraska's Document Repository, allowing authorized staff access. Integration of the State's Onbase DMS with RTC expediting using Content Management Interoperability Standards (CMIS) standards. The CMIS standards include predefined messaging protocols that simplify the creation of these interfaces.

The Wipro/IBM team works with the Department to define roles and authorization levels appropriate for each team member.

Provide samples of current EES document in the proposal.

The *SmartPro MedEE* solution contains multiple product documents that describe the solution, in total. For example, documentation for IBM Cúram is made available via a web site, which is updated regularly to include any and all product changes. Documentation includes content to support the full design and development lifecycle as well as ongoing operations and maintenance. Available documentation includes installation guides, configuration guides organized by functional components, security guides, business guides to assist business analysts with out-of-the-box functionality, and much more.

Due to the length of the documents, and for the sake of readability, these documents are referenced in Exhibits and Samples 4.

xi. Implementation

- Describe in detail your recommendation for a single or multi-phase EES implementation. The description must include the reasoning behind the recommendation, and the benefits of the Bidder's recommendation over the other implementation phase option.

The Wipro/IBM team proposes a single phased implementation for the *SmartPro MedEE* solution. We realize multi-phase implementations are very common and can mitigate some risks that are unavoidable in a single phased implementation. Typically, multi-phased implementations are based on one of three approaches; delineation by functionality, geography or user groups. After reviewing the pros and cons of each implementation approach, we concluded that a multi-phased implementation would increase the risk without yielding additional value to the Department.

Risk discussed included cost management, data quality, the need for unnecessary interfaces and user controls, unstable parallel system management, and decreased staff satisfaction due to parallel process and increased errors. The end goal is to reduce the overall cost of ownership, manage risk

and ensure satisfaction. Therefore, the single phase implementation approach of *SmartPro MedEE* is our recommendation to the Department.

Functionality – Most eligibility and entitlement platforms on the commercially available market are multi-application, multi-vendor. To integrate the application requirements to be one cohesive solution requires concurrent development for a portal, rules engine, business process management function, enterprise content management, and analytics platform. The *SmartPro MedEE* lends itself to a single phased implementation because our proposed application has most of these features built into a single platform. For those features that are not native to the *SmartPro MedEE*, adapters and integration points using SOA compliant enterprise applications compliment the solution. The cost risk of custom development is significantly minimized.

Another implication is that it does not make sense to separate the functionality. *SmartPro MedEE* does not require implementation of functionality in pieces, it is deployed as a single product. Any attempt to delineate phases by functionality would be artificial and not yield a benefit for the Department. This approach also requires the ability to separate out discrete functional components in the existing legacy system, N-FOCUS. It is unclear whether this is even an option given that N-FOCUS is a twenty year old solution and supports multiple programs in addition to Medicaid. The risk this would pose to all the programs involved is too great to entertain delineation by functionality as a viable option.

The other important consideration is that *SmartPro MedEE* is limited to Medicaid. For clients looking for a solution that crosses multiple program areas, we would recommend a multi-phased approach. Some of the decision points to consider for a single or multi-phased implementation are include geography and population profile, expected duration of the project, and user types.

Geography – Some clients phase their implementations based on geography. This is particularly relevant for clients with very large populations, a large number of regional offices requiring training, a diverse mix of automation needs, or when the geographies present additional uniqueness's such as rural and urban communities. The rural implementations may introduce additional challenges. Based on those challenges, services may be delivered differently.

Nebraska's population is not large enough to require a phased roll out. Although the Department does support rural and urban communities, there was nothing included in the RFP to indicate that there are disparate communities in the State of Nebraska requiring special consideration.

Project Duration - Many implementations are complex, involving multiple business areas and programs. These projects frequently span two or more years for the implementation phase. In these situations, it may be politically necessary to show a quick win or phased implementation effort. For example, North Carolina NC Fast quickly stood up a citizen self service portal to show an immediate return on their investment. Since Our Team is proposing a one year implementation timeline, we do not believe a quick win or phased approach is appropriate.

User Types – the last potential delineation is user types. Since *SmartPro MedEE* is a portal based solution, it lends itself to easily supporting multiple user types such as: case managers, community based organizations, employers, citizens/residents, service providers and healthcare providers. In some instances, it is recommended to roll out the solution to internal agency user groups and citizens in the first phase. Afterwards, the second phase would focus on employers or service

providers. None of these apply to the Department. The user types are limited both in total number and in type.

The Wipro/IBM team appreciates the need to control risk and we have proposed a solution and an approach to minimize the risk while maximizing the value of the functionality and architecture of *SmartPro MedEE*. In the instance of the Department’s implementation of an Eligibility and Enrollment solution, adopting a multi-phased approach will increase cost, increase time and increase risk through the introduction of unnecessary complexity. For this reason, our team recommends and has provided a project plan to support a single phased approach.

Provide a description of a previous implementation or a current implementation project underway where the Bidder’s implementation recommendation can be supported.

An example is included with response to the following RFP requirement regarding a recommendation for a Pilot. For the State of Nebraska, we are not recommending a Pilot, due to the size and complexity factors discussed below.

Provide a recommendation whether to include a Pilot EES. The Pilot recommendation should describe the value gained, duration, and parameters for a pilot.

The Wipro/IBM team’s implementation approach does not include a pilot phase. The cost of implementing a pilot, while helpful to identify requirement gaps, will only increase the operational overhead. Additionally, the time to get the production environment to market will increase significantly because all efforts will be spent on a Non-production environment. The Wipro/IBM team's understanding of the EES system requirements mimics that of implementation completed in many other states by us or business partners we work with. Our goal is be considerate of the State’s finances and rigorous delivery schedule. However, since *SmartPro MedEE* leverages IBM Cúram, the users and project team will be able to see the application and how it will look in Nebraska from Day one of the project. We are not starting with a blank whiteboard but with the leading COTS application specifically designed to meet the needs of Health and Human Services organizations.

Table IV-47: Risk Analysis of a Single-Phased Implementation Approach

Risk	Single Implementation	Regional
Scale risks		
Cannot train all users in an optimal window, close to their personal implementation date	- Need to train all users in a single time window. Need a very focused training plan as provided by our proposed approach	Can split training by wave. However, for each region, the problem remains the same, in terms of having all their users have to take time away in their window.
Cannot do manual correction of data being migrated in a short cut-over window.	- Need to migrate all data in a short window (typically one weekend). Need a very focused data migration plan as provided by our proposed approach	Can do any manual correction of data integrity or mismatch issues in waves, as each region’s data is migrated.
Cutover may fail, and reversion to old system may be required. All data	- More people use the new system so more data per day to be re-entered.	Only data from one region needs to be rolled back. However, roll back after first wave probably

Risk	Single Implementation	Regional
Scale risks		
captured in new system must be re-entered into old system.		not feasible.
Unique risks		
Rules may be implemented differently in old and new systems.	+ No issue, only one system.	Clients in different regions treated differently, or need to ensure all rules are implemented identically.
Phased roll-out may take longer than planned.	+ No issue, only one roll-out.	Need to freeze all changes during rollout period or implement changes in both systems.
Need to be able to search for clients across both operational systems to ensure a 'new' client is not on the other system.	+ Only one system – no synchronization needed.	Need workaround to ensure clients found regardless of which system manages their case. Two-way data synchronization would be challenging.
Clients could move to a different region, using a different system.	+ Not possible.	Need workaround to ensure smooth transfer.
Interfaced systems need to 'see' a single system.	+ There is only one system.	Additional temporary software needed to split and merge interface data.

Below are key facts associated with a successful implementation in which the single-phased implementation was used. As described in the table below, this client user base included 500 internal and 65,000 external users, with characteristics similar to those of the Nebraska EES, in terms of the aging N-FOCUS system significant historical data to convert.

Table IV-48: A Cúram Single-Implementation Example – Key Facts

Attribute	Implementation Data
Client Project	Project Harry, South Australia Workcover
Users	Project Harry involved 500 internal and 65,000 external worker's compensation users.
Transactions	1 million workers compensation claims (Cúram integrated cases)
Fraud Cases	90,000 fraud cases, disputes and reviews (Cúram issue cases)
Medical Certificates	2.7 million medical certificates
Historical Transactions	36 million historical financial transactions with a total value exceeding AUD 20 billion
Key Challenges	Tightly coupled, aging legacy system Volume (640 million records across 3 systems) and quality of data Why the selected approach was used Phased rollout by function or geography would require changes to a

	'fragile' legacy system One time data migration minimized risk of data integrity issues
Success Factors	Disciplined project management including tight scope management by both IBM and the client – well managed change control Significant focus on staff training and familiarization prior to go-live

When considering options for implementing complex applications, a single implementation approach is often viewed as a less desirable choice. Training logistics, size of the data cut-over, enterprise-wide impact of any 'glitches' are all good reasons for preferring other approaches. In the case of Nebraska; however, the nature of the current system prevents a functional based rollout, and provides significant risk to manage the modifications required to support a regional rollout, and the size of the user community effectively makes even a region based rollout a large implementation. Given these facts, the Wipro/IBM team is recommending a single implementation approach for the State of Nebraska.

We have demonstrated with Cúram projects in other geographies that a single implementation can be very successful. From our experience with Project Harry as well as experience with very large single implementations in the financial and insurance sectors we have identified the following factors that will contribute to a successful rollout:

Table IV-49: Success Factors Contributing to a Successful Rollout

Key Success Area	Attributes of a Success Implementation
Project Management	Implement rigorous project management oversight of the organizational change and cutover processes. Start well ahead of the planned cutover with a very detailed cutover plan (the plan should have detail down to hours and sometimes minutes in the final days). The implementation strategy and design should be an activity that is initiated at the start of the project, and be one of the factors that is considered when evaluating application design and scope change decisions.
Data Conversion	The data conversion strategy needs to be developed early in the project, including selection of the method and tools required to adequately cleanse and test the data and data conversion process. Ample time needs to be given to testing the final data cutover plan well in advance of the actual implementation date.
Implementation Planning	Project Harry implemented a full dress-rehearsal two weeks prior to the actual cutover date. In this dress rehearsal, the new application was implemented over a weekend, including full data conversion. All users then signed onto the system and processed applications in a 'production' environment for two days. At the end of the two day rehearsal, the new system was backed out and the legacy system restored. While the two days of work needed to be re-done in the legacy system, the benefits of this approach were significant. It proved that the system could be cut-over in the time required. It allowed all users to test run the new system in a 'live' environment identifying potential gaps in training or business processes, or system defects. It also provided insight into potential performance issues. Items that were discovered were then remedied prior to the actual cutover date.

Evaluate the Use of a Pilot	Implement a true pilot with a limited number of users, and provide enough time between pilot evaluation and system go-live to respond and remediate any issues that are identified.
Other Key Factors	Appropriate pre-approved budget and resource allocation to ensure success. Establish a 'war-room'; a control center for the implementation process

Summary

Given the difficulty of modifying the current system, due to its complexity and tightly cohesive nature, the risks inherent in having two systems live at the same time outweigh the additional risks of a single transition. These risks can be mitigated by a detailed plan with planning and testing starting very early in the project plan.

xii. Post Implementation Support

The EES Contractor must provide EES hosting, Disaster Recovery services and a dedicated Service Desk and Application Support Help Desk. The Service Desk will provide the single point of contact for systems related issues. The Application Support Help Desk, to be staffed during business hours (to be determined by the State of Nebraska), will provide support for issues related to the systems business functionality which need to be escalated for investigation and resolution. Both the Service Desk and Application Support Help Desk must be integrated into the internal support structures within the State of Nebraska. The Service Desk, the Application Support Help Desk, and associated staff must be physically located in the continental United States.

Once the solution is implemented in the production environment, Wipro/IBM will provide warranty support/Post Implementation Support for all services for a period of 180 days. Warranty support will cover fixing any of the application defects for requirements against which any of the solution components are developed. Nebraska will ensure that maximum features/functionality of the system will be used in the warranty phase to ensure the stability of the solution implemented. During the warranty phase, Wipro/IBM will fix the defects which occur due to implementation of any requirement in scope. For product defects, the Wipro/IBM team will work with the appropriate vendor to correct the defect as part of the product warranty program.

Wipro will provide *SmartPro MedEE* hosting, Disaster Recovery services and a dedicated Service Desk and Application Support Help Desk as part of the maintenance and support. The Service Desk will provide the single point of contact for systems related issues. The Application Support Help Desk, to be staffed during business hours (to be determined by the State of Nebraska), will provide support for issues related to the systems business functionality which need to be escalated for investigation and resolution. Both the Service Desk and Application Support Help Desk are integrated into the internal support structures within the State of Nebraska. The Service Desk, the Application Support Help Desk, and associated staff will be physically located in Omaha, Nebraska.

1. System Hosting

1. The EES Contractor will be responsible for hosting all systems during the DDI Period and must provide approach and costs for Infrastructure as a Service (IaaS) and Platform as a Service (PaaS) for all environments. The EES must be hosted in a Tier IV data center with the provision of disaster recovery

during the DDI Period. The Contractor shall provide, or utilize as applicable, the following hosted services by environment type. The Bidder is to propose, specify, implement and support as many environments or instances within each environment type as necessary to fully support the design, construction, delivery, operation and ongoing maintenance of the system as per this RFP. These environments are deliverables and are therefore required to be approved by the Department.

Sandbox: The sandbox environment is intended primarily for learning and experimentation of system features rather than for testing alterations to existing functionality. It isolates configuration changes and outright experimentation from the other environments within the systems landscape. Sandboxing protects "live" servers and their data, tested source code distributions, and other collections of code, data and/or content from changes that could be damaging. The Sandbox should replicate the minimal functionality needed to accurately test the functionality or configuration being exercised. This will be hosted by the Contractor in its facilities in the continental United States.

Configuration/Development: This environment will consist of the servers necessary to implement all the servers including Database, Application, Portal and other technical layers of the system stack. The environment will be used to support the daily software build cycle and to execute unit test to verify the continuous integration of the code base throughout the development cycle. This will be hosted by the Contractor in its facilities in the continental United States.

Testing: At scheduled intervals, specific builds of the code base will be placed into a "testing environment." This environment will be overseen by the testing team who will use it to verify functionality that has been implemented. This will be hosted by the Contractor in its facilities in the continental United States.

Quality Assurance: This environment will be used to assess compliance to requirements, risk of release, and performance capacity. This environment may be a scaled replication of the production environment to minimize errors caused by incompatibility. This will be hosted by the Contractor in its facilities in the continental United States.

Production: This environment should scale to accommodate the proposed and future capacity of the system and will be built for flexibility, scalability and redundancy. This will be hosted with the Contractor, or potentially collocated with other mission critical MLTC applications with another provider. This will be hosted by the Contractor in its facilities in the continental United States.

Training: This separate and stable environment, must mirror production or as specified by the State of Nebraska, for use to train staff and other system users. The environment must have a minimum daily refresh capability to allow Trainers to delete practice and assessment data. This will be hosted by the Contractor in its facilities in the continental United States.

Disaster Recovery: All required environments to support the ongoing operation of the production system in the event of a disaster or outage condition at the selected computing center(s).

Each environment should be on a logically and/or physically separate sub-network to safeguard access to configuration, data, and code. The EES Contractor will maintain tight control over the configuration of all code through the use of a source control tool. This tool will provide the Development team with the ability to check out code for editing in developer workstation sandboxes and to maintain a common code repository. At the end of the implementation of the EES, the State of Nebraska will have access to all environments.

The EES Contractor will provide a System Maintenance, Support and System Transition Plan for transitioning the production environment to the State of Nebraska's Data Center if desired by the State.

All Environments are implemented as Workloads of one or more Virtual Machines, executing on one of two identical IBM PureApplication Server Appliances dedicated to the *SmartPro MedEE*. During normal (non-disaster) operations, some Environments are assigned to the Primary Server and Data Center, others to the Secondary Server and Data Center. Either of the two servers is capable of hosting all Environments simultaneously by itself, though with reduced capacity for the non-Production Environments.

Both Data Centers are located within the continental United States: the primary in Omaha Nebraska, the secondary in Tempe Arizona. The figure below portrays the hosting environment – two PureApp appliances – one each for primary and disaster recovery (DR). Each of these PureApp appliances is virtualized to easily accommodate the environments required to support the *SmartPro MedEE* solution.

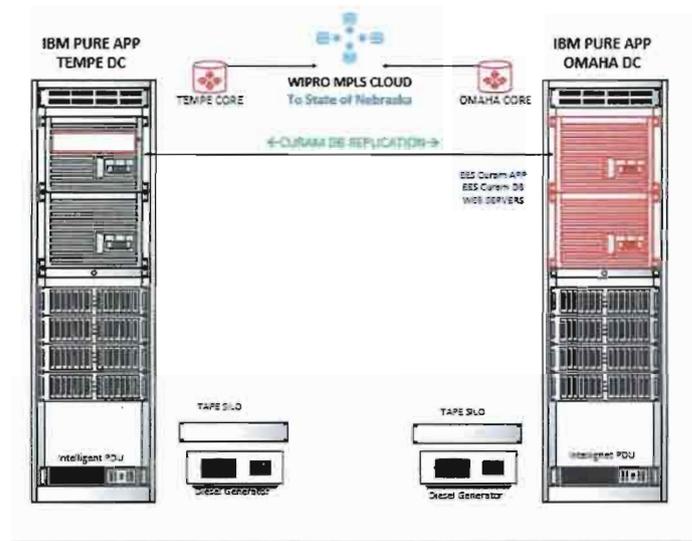

Figure IV-170: SmartPro MedEE PureApp Appliance

All Environments are independent collections of one or more coordinated Virtual Machines, and are logically isolated from each other. VLAN separation is used to isolate the Production and Disaster Recovery Environments from the Development Environments. All public-facing environments (e.g. Production and Disaster Recovery) are also layered in Firewalled tiers, with the Web Servers executing in a formal DMZ while Application and Database Tiers operate in a protected Zone.

IBM Rational Team Composer will be used to implement a centralized repository for change and configuration management, including source code control. The RTC tool implements string Configuration Management, and supports checkout, check-in, locking, and other common configuration and version management metaphors. With RTC, the entire configuration, including hardware, software, scripts, programs, rules and workflow are under configuration management.

The Wipro/IBM team will develop a Transition Plan for Transitioning the Production Environment to the State, should it so desire.

2. Equipment Summary

The proposed infrastructure and systems will be housed in a purpose-built and dedicated physical environment. It is imperative that the proposed infrastructure and systems provide the highest level of control and responsiveness in meeting the State of Nebraska's business needs. The Primary Data Center (PDC) shall be configured at the Tier IV – Fault Tolerant Site Infrastructure Level (as defined by the Uptime Institute).

The PDC will provide processing power, control data traffic, and will house and manage all participant and program data. The PDC will at a minimum house:

- a) Web Server(s);
- b) Application Server(s);
- c) Integration Server(s);
- d) Portal Server(s);
- e) Database Server(s);
- f) Analytics Server(s);
- g) Report Server(s); and
- h) Storage Area Network (SAN).

Wipro will install one (1) PureApp appliance in Omaha and one (1) PureApp appliance at our disaster recovery site. The PureApp appliance integrates all of the of the servers listed above using virtualization and includes 50gb of storage in each PureApp appliance.

The PureApp appliances are contained within Wipro Data Center Services (DCS) data centers. Wipro Data Center Services is the only end-to-end IT Infrastructure Management solution company that offers large and mid-market customers an Enterprise Delivery Model to expertly manage the burden of vital daily operations so our customers can focus on their strategic goals. DCS operates world-class global data centers and offer extensive expertise with every computing platform, including iSeries, Windows, UNIX and Linux servers, Mainframe, Cloud (iStructure), as well as networking, security and storage systems.

Wipro Data Center Services manages its customers' systems in world-class, purpose built data centers that are fully redundant, fault tolerant, highly secure, and include hardware, software and data communications equipment. Our geographically dispersed data centers total more than 430,000 square feet. Our data centers undergo SSAE16 audits, and are PCI certified. (Wipro Data Center Services manages six data centers within the continental United States and one in Meerbusch, Germany).

3. Network

The Contractor is expected to provide highly redundant connectivity to the State of Nebraska Data Center facilities located in Lincoln, NE for all communications between the systems at Contractor's facility and those at the State of Nebraska. All users will be using the existing network infrastructure and functionality of the State of Nebraska's WAN. The Contractor is expected to leverage the State of Nebraska's WAN and the Internet to provide connectivity to all State of Nebraska workers.

Wipro Data Center Services backbone, datacenters, and Core Point of Presence (POPs) located in carrier neutral facilities provide for over 100 different carriers and telecommunications providers to facilitate interconnection with customer networks. The figure below depicts the network LAN design for the data center.

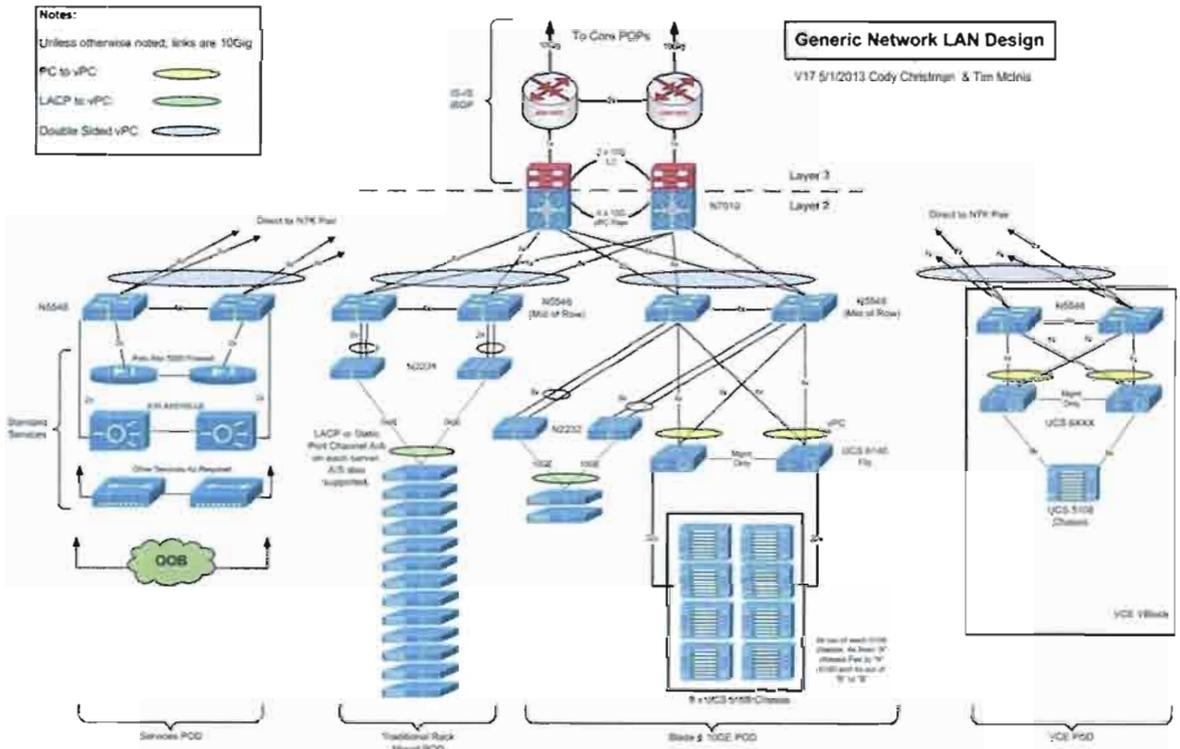

Figure IV-171: DCS Network LAN Design is Fault-Tolerant and Highly Available

A component of the **SmartPro MedEE** system will be engineering a 3-tier, fully redundant network between the Nebraska State office and the Omaha and Tempe data centers. In the The Wipro/IBM team solution design, we utilize existing ‘network’ connectivity to the Internet from both of the Wipro data centers, as well as dedicated connections to the State offices for both employees and contractors to utilize VPN (SVNP) connections to the various EES environments. We have planned for a dedicated circuit connection to the State data center, which we will connect to the Wipro MPLS cloud so that we can utilize our global network to ensure we are always able to route information, regardless of single circuit or connection issues. The solution also includes data center – data center bandwidth to accommodate database/systems replication between the Omaha Production (PROD) and Tempe DR data center environments. That bandwidth will also account for the ability to create a change of network connectivity service between environment solution endpoints further alleviating the ‘single point of failure’ possibility.

The network solution encompasses the ability for State employees to access **SmartPro MedEE** from the State offices, as well as via the State VPN network, while keeping the EES system access for enrollees accessible from the Internet, in a separate scheme. McAfee and Palo Alto IDS solutions are utilized to protect from network attacks, while segmenting the network traffic to the various data centers, where the systems reside. The next layer will encompass internal LAN switches and load balancers (where required) to ensure optimal system performance and segmentation. The final layer will encompass local switching and redundant connections to each of the EES systems.

4. IT Service Desk

The EES Contractor will be responsible for providing a professional IT Service Desk to be physically located in the continental United States. The IT Service Desk will enable the central management of service delivery and provides the functions and oversight of Contractor’s support services including:

- a) Incident Management;
- b) Problem Management;
- c) Change Management; and
- d) Service Requests.

Wipro has adopted the industry accepted framework of ITIL v3 as the service management framework to deliver IT infrastructure services. The ITIL v3 framework will be utilized for defining various processes for delivering IT services to the State of Nebraska. The ITIL v3 framework provides comprehensive guidance on the IT Service Management (“ITSM”) framework which approaches service management from a service lifecycle perspective. Wipro has used this framework to deliver and manage reliable, effective and efficient IT services to various customers across industry verticals. Wipro’s infrastructure services are certified to conform to ISO20000 standards and this is a testimony of the reliability and consistency of IT services provided by Wipro. This ensures that the State receives IT services that assists in meeting its business objectives. The key processes that Wipro will deploy include those listed in the table below.

Table IV-50: Wipro Key Process to Support Highly Mature Service Delivery Capabilities

Availability Management	Change management	Capacity Management
Configuration Management	Incident Management	Major Incident Management
Problem Management	Release Management	Service Request Management
Event Management	Service Catalog Management	Access Management

Incident Management

The Wipro/IBM team will define and implement the Incident Management process for the State. This will begin with the activity of assessing the current process followed by documentation of gaps (if any) and review the findings with the State. Post review, the The Wipro/IBM team process consultant will begin the definition and implementation of the process.

Key aspects that will be reviewed while analysis, definition and implementation is undertaken include:

- Clear defined owners and their accountability (RACI Matrix)
- Process standardized for use across all towers (Infrastructure and Application)
- Relationship to other service management processes
- Escalation Matrix (both Hierarchical and Functional)
- Prioritization of incidents based on their effect on business processes

Key activities of Incident Management are listed below and will fulfill the requirements of the State of Nebraska:

- Tracking of Incidents (Initiation -> Resolution -> Closure)

- Notification of status and resolution to stakeholders
- Initiate request to Problem Management for RCA
- Closure of Incident only post user / business confirmation
- Escalation of tickets functionally for quick resolution
- Major Incident Management process
- Implementation of work-around or solution in accordance to change management process

Major Incident Management

A major incident definition is an event, which has significant impact or urgency for the business and demands a response beyond the routine incident management process.

As part of the analysis that the The Wipro/IBM team consultants will perform for incident management, the Major Incident Management (“MIM”) process will also be analyzed and information would be documented on what services the State classifies as major Incident (MI) scope.

The Major Incident Management process is linked as part of the incident management process. In the event an incident is flagged to a MI status, the Incident Manager or the corresponding role would be the owner of the issue until the status is solved; an acceptable workaround is implemented; or the business decision changes to state that situation of MI is no longer justified.

Problem Management

The Wipro/IBM team will define and implement the Problem Management process for the State. The process definition will ensure that the requirements of the State are met.

Key aspects that will be reviewed while analysis, definition and implementation is undertaken include:

- Clear defined owners and their accountability (RACI Matrix)
- Process standardized for use across all towers (Infrastructure and Application)
- Relationship to other service management processes
- Escalation Matrix (both Hierarchical and Functional)
- The figure below illustrates an overview of our proposed Problem Management Process

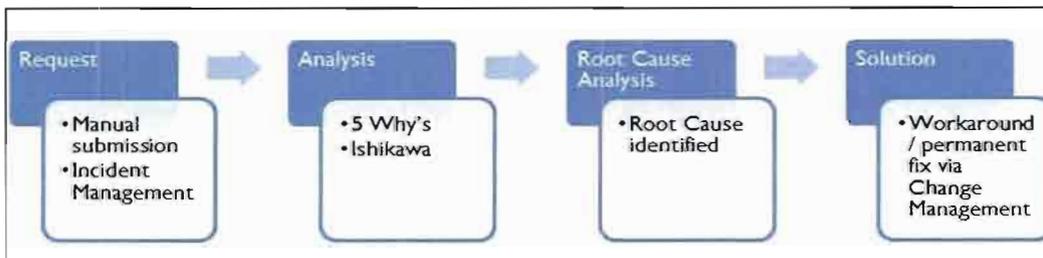

Figure IV-1.7.2: Problem Management Process Overview

Service Request Management

The Wipro/IBM team defines the process and the relationships of service request management for the State. The defined process will include:

- Coordinating mobilization of resources required to fulfill the service request
- Provide timely responses
- Management and oversee the implementation of service request
- Service request reporting

Touch points and key activities in the service request management process would be:

- Service Requests can be logged either manually by the Service Desk function or through various integration methods that has been proposed to the State.
- Service Request (“SR”) classification can be performed manually by the Service Desk function or by the requestor. The classification can also be automated based on the services selected in the Service Catalogue.
- Classification will determine to which group the SR needs to be automatically assigned and the Priority that needs to be tagged to the SR.
- Updates by e-mail can be sent to users (requestors) from the tool that has been proposed to the State. Standard notifications are sent to the users on click of a button and these notifications are tracked as part of the work log.

Service support management represents a core support center that handles and manages the resolution of Incidents, Problems and Changes. This set of services manages events as they occur, and assures escalation, ownership and closure of these events. The Service Desk should follow best practices based on ITIL v3 standards.

IT Service Desk approach should structure the engagement into four distinct stages:

- a) Stage 1: Service Initiation - This stage covers all initiation activities.
- b) Stage 2: Service Transition - This stage describes a process of transitioning the Service Desk into a full production environment.
- c) Stage 3: Service Operations - This stage is the full systems support of the Maintenance and Operations Phase, where the Contractor has assumed full operational responsibilities.
- d) Stage 4: Service Re-Transition - Upon written notification, if the State of Nebraska elects to assume operational responsibility for the Service Desk, this represents the stage where the Contractor will transfer knowledge and collateral to the State or a designated Service Provider.

During the above four staged approach, the following activities shall be addressed during Service Operations:

- a) PRODUCTION SUPPORT: Supporting production, addressing system interruptions focusing on identifying and fixing system faults quickly or crafting workarounds enabling later root cause analysis and problem remediation.
- b) MAINTENANCE SUPPORT: Making changes to existing functionality and features that are necessary to continue proper system operation. This includes routine maintenance, root cause analysis, applying change requirements, software upgrades, business need changes, rule changes, infrastructure policy impacts, and corrective, adaptive or perfective maintenance, as appropriate.
- c) ENHANCEMENT SUPPORT ANALYSIS: Analyzing the functional and non-functional requirements for adding new functionality/features to the EES on prioritized requests from the user community. This includes interpreting any rules changes and other critical business needs from a technical and logistical standpoint.
- d) USER SUPPORT: Providing application-specific support coordinated through the IT Service staff as well as conducting system research and inquiries.
- e) HELPDESK PLATFORM: The IT Service Desk shall utilize a dedicated implementation of industry standard service desk software suite to be hosted and used by the State of Nebraska.
- f) DATABASE SUPPORT: This includes both DB support as well as refactoring the EES to enhance database efficiency in storage and query response time and coordinating with system administrators to enable ideal hardware.

Wipro service desk has been established for over 20 years, all four stages and more are incorporated into our standard service desk approach.

Support Model Description

The Wipro/IBM team has proposed a solution framework based upon the overall landscape assessment, specific objectives and success criteria of scalability, innovation, improving customer satisfaction, lowering operating costs, improving service levels, and providing higher reliability. Keeping the above design principles in mind, The Wipro/IBM team has developed a solution which meets the key objectives of the design principles.

Table IV-51: Support Model Design Principles

Design Principle	Description
Economies of Scale	Role rationalization: Consolidation of Incident and Problem Managers, Leads across Service Desks.
Process standardization	Incident and Problem Manager: End to End ticket ownership Knowledge Manager: Utilization and update of Knowledge Base. Operating Level Agreement: Defining OLA for incident resolution
Reduced Cost/Incident	Improve Automation : Self Help / Heal solution
Continuous Improvement	RCA (Fault Tree Analysis): Year on Year Increase Chat Support Count: The Wipro/IBM team will bring experience on implementing defined chat scripts and executable files for improving chat effectiveness.
Least disruption to existing services	Transition As-Is : Two six sigma projects – CTI consolidation and FLR / Incident Management measurement ○ Phase I - Increase in productivity from the current state Phase II - Reduction in effort due to consolidation of Service desks FLR improvement - Calls resolved by Service Desk in an optimized time
Quality and Six Sigma	Quality: team includes Quality Analyst throughout the contract term to implement Service Improvement Programs based on CIP / Lean / Six Sigma
Delivery measurement	Service Levels and KPI: Service Levels and KPI for each delivery component which will be common Level 1.5 team will provide the lever to rationalize tasks at Level two and Level 3 improving Service Desk resolution

The following are the key silos and roles considered for the Service Desk consolidation roadmap. These role designations exceed typical delivery roles, such as SDM, Leads, L2, etc.

Table IV-52: Wipro's Infrastructure and Key Role Mapping to Support Outstanding Service

Element	Key Roles for Accomplishing
Infrastructure	Wipro Infrastructure Management Group
Technology	Tools SME Automation Engineer – Scripts

Element	Key Roles for Accomplishing
People	L1.5 skills desktop trained engineers Voice Coach- soft skill training Training Manager – Synergy with apps team
Operations	Incident Manager - IM / SRM process Problem Manager – Trend analysis SQA – Six Sigma and Lean project
Process	Wipro process framework which ITIL V3 aligned as deemed best fit for the State of Nebraska

The proposed Wipro Operational Model includes the entire life-cycle, from receiving an incident (by email, phone and web) by the Service Desk to its resolution. The Wipro Service Desk will provide a holistic approach wherein the Level 1.5 team will be an integral part of the Service Desk in order to ensure on-time resolution of typical issues.

- **Contact Medium:** Phone, Email, Web, and Chat.
- **Call Routing:** Toll free numbers are provided to all countries for the end-user. Wipro Service Desk agents will log onto Wipro ACD for call distribution.
- **Ticketing:** The Service Desk will use the proposed iGCC Remedy ticketing platform to log tickets and escalate tickets to the various resolver groups. The incident and escalation process and mechanism shall be designed and modified based on joint consultation between the State of Nebraska and Wipro. The Service Desk will follow the Execution Process Document (“EPD”) as will be defined during the transition.
- **Performance:** All reports will be generated related to the tickets and calls via the Remedy and Wipro ACD. While the frequency of the tickets will be monthly the Wipro operational team will monitor the performance of the team on a daily basis.
- **Knowledge Management:** Wipro will utilize the Remedy KM Module as the common repository of knowledge which will be accessed by the Service Desk agents.
- **Economies of Scale:** Incident Manager, Knowledge Manager and Voice Coach are the resources which are shared across the various towers for ensuring a high quality of service and continuous improvement.

5. Software Configuration Management

Software Configuration Management includes the identification and maintenance of System software components and the relationships and dependencies among them. These activities include:

- Automatic capture and storage of IT Service to Application, Application-to-Component and Component-to-Component relationships; and
- Maintenance of the history of those relationships and any transformation required to appropriately manage and document (e.g., source control, version control, profiles, security plans) configuration changes affecting the application and its processing environment.

Code Migration includes promoting new and modified code, configuration, and scripts, in support of new and existing applications through development, test, and production. These activities include:

- c) Migrate code from development to test on an agreed upon basis;
- d) Track migration status and notification;
- e) Identify and resolve issues with the services delivery team and development teams;
- f) Develop and document recommended operations and administration procedures related to code migration; and
- g) Develop and document test-to-production turnover requirements and instructions for each project or release.

The Wipro/IBM team uses Rational Team Concert to manage changes to the configuration of the SmartPro MedEE solution. Rational Team Concert is used to capture relationships between applications and associated code, maintain history of the relationships, migrate code from one environment to another.

The Wipro/IBM uses RTC throughout all phases of the DDI and into the Maintenance and Operations Phase. With this end-to-end use of RTC, the development team is able to know, through the use of the tool, when there are conflicts between maintenance and development teams.

The Wipro/IBM team will develop and document recommended operations and administration procedures related to code migration. We will also develop and document test to production turnover requirements and instructions for each project and release.

6. Change and Release Mgmt

Change and Release Management activities include services required to appropriately manage and document (e.g., impact analysis, version control, library management, turnover management, build management, parallel development) changes to the application and any of the constituent components being developed. Change and Release Management also includes services required to appropriately manage and document changes to the underlying application development environment components. These include the following:

- a) Library Management the classification, control, and storage of the physical components of the application;
- b) Version Control the maintenance, tracking, and auditing of modifications to an application's components over time, facilitating the restoration of an application to prior development stages; and
- c) Turnover Management the automated promotion of software changes across different phases of the life cycle (e.g., development, unit test, systems test, and production), including management of the approval process, production turnover, and software migration control.

The EES shall utilize a centralized solution to automate and control the software change and release management process.

- a) This software change and release management process will control migration patterns (i.e., how a given set of code moves from one environment to another); and
- b) This software configuration management process will control versioning, access controls, data quality, etc., for each environment.

The Wipro/IBM team considers Change Management a key component in delivering a quality system, on time, and within budget. We follow a formal, documented Change Management Process to ensure that changes to a project are managed and handled appropriately. Our change

Management Process assumes the establishment of a Change Control Board committee. This committee is constituted of project stakeholders from both the Wipro/IBM team and the customer state agency. The Change Control Board is the authority and final decision maker regarding the acceptance or denial of all changes introduced to a project.

In accordance with our Change Management Process, all changes are submitted as formal Change Requests and are reviewed internally by the Project Manager who investigates the request and determines a remedy that provides a recommended solution. The project's Change Control Board is presented with the investigation documentation and determines the feasibility of the change request and the risk to the project.

Based on the nature of the change, the cost is added to the Change Request and submitted to the State for approval. When approved, the change will be added to the work plan schedule and tracked through completion.

7. Data Retention and Archiving

The EES should be designed to support multiple layers of data backup protection using a combination of both disk based and tape based technologies to meet the EES Backup and Recovery (BU/R) requirements. The EES should leverage SAN replication and mirroring technologies to provide online, disk based system data protection. The EES should utilize SAN-based; block level data replication to protect both critical Database and Application components. Mission critical system components will also be mirrored synchronously to provide fast access to critical functions in the event of failure. In the event of catastrophic system failure at the primary site, clients can be redirected to the secondary site via DNS to utilize redundant systems present at the secondary site. Clients will then be able to retrieve application from replicated sources that will be up to date based on the last completed replication cycle.

Additionally, database replication should also be utilized to synchronize data between both primary and secondary databases. Finally, another layer of protection should be designed to provide traditional, versioned system data backup to tape storage. The implementation team shall create new backup job policies specific to the EES. All EES database and application backup policies will utilize recommended schedules, and all policies will include at least one weekly full backup plus daily incremental backups to ensure data integrity and prevent data loss. Data on all tapes will also be encrypted to ensure security in the event tapes are taken to an offsite storage facility.

The backup solution shall utilize on-line backup methodologies where possible that would enable quick backup and restore. Tape and off-site backups should be used to comply with long-term retention and meet the Nebraska Secretary of State Records Retention standards.

Documentation of all B/UR related processes and procedures will be generated during the course of the project, will be validated during system test, and will be presented t at project close. Additionally, processes and procedures that mandate routine testing and restoration of system backup data will also be developed. In this manner, the effectiveness and health of the proposed System B/UR solution will be continually validated.

Data backup, retention and Disaster Recovery are integral to any enterprise level solution. The Wipro/IBM team employs an extremely rigid and verifiable process of daily, weekly and monthly data/environment backups. State of the art LTO5/6 tape libraries are used to backup many hundreds of Terabytes in our data centers. For the EES system, the solution utilizes both data replication between data centers and local tape backups of specific systems, each night. Retention of daily tapes will be held onsite at the local data center for the first 7 calendar days after use. They are then taken to an offsite retention facility and stored for the remainder of the duration that is required to adhere to Federal, State, local or customer requested data retention policies/guidelines. The

offsite tapes can be recalled 24/7/365, in the event the required data to be restored cannot be obtained on tapes stored at the data center.

The *SmartPro MedEE* production database, restore point logs as well the AIX OS server environment settings will be replicated and/or synchronized and verified many times a day via the hardware appliances utilized in our solution. Additionally, the local tape silos will accommodate complete system backups of each of the systems in each of the respective data centers.

Since all of the required storage for this solution will be included in the compute appliance, there will be no external connectivity to SAN frames (although available) or other devices, allowing extremely fast and efficient local disk access. Furthermore, the intelligence build in to the IBM PURE APP systems allows each of the server compute instances to be self aware and repositories of the various Production Web, App, DB, etc. systems will synchronize to the appliance in the DR center, providing the ability to gain sub 60 minute disaster recovery in the alternate data center site.

The entire network routing between data centers is accomplished via IP layer-three network communication, which by default requires DNS routing. During the build of the EES system all servers, interfaces and system routable components will be coded with DNS names, and not specific IP addresses, that can easily be understood via the multiple DNS servers that reside in our network. This will obviously be verified during systems implementation, and verified during the first annual disaster recovery drill, post 'go-live'. As part of the DR test and the developed enterprise support run book, adjustments will be constantly made to the processes and policies to ensure full adherence and specific outcomes in the support and management of the EES solution.

8. System Performance Monitoring and Reporting

SYSTEM PERFORMANCE MONITORING AND REPORTING

- a) **PERFORMANCE MONITORING:** Operational performance monitoring begins with the tracking of each and every service request via a ticket tracking tool capable of capturing and providing detailed information regarding the Contractor's efforts associated with resolving each specific request. The Contractor must ensure that all data collected is accessible by appropriate stakeholders to ensure an "open book" approach to problem management and performance monitoring.
- b) **PERFORMANCE REPORTING:** The Contractor's Service Delivery Manager is responsible for presenting the Monthly Performance Status deliverable against the SLR expectations. The monthly report will include monthly progress for each support area as well as a rolling trend chart. Any deviations from expected performance will be reviewed and discussed with agreements toward corrective action plans defined jointly with the appropriate State of Nebraska management. Continued failure to meet or exceed committed targets should result in escalation of issues.
- c) **MONITORING TOOLS:** The Contractor should propose one or more monitoring tool(s) to proactively monitor the performance of key infrastructure components of the EES. These tools should provide a flexible, well-rounded solution for monitoring server and network health. These should also monitor basic services and database connectivity, and perform advanced monitoring of Web-based applications through customizable monitoring scripts. These tools should have extensively customizable dashboards to provide availability and response time on devices, URLs, WAN links and services; besides providing health and performance statics of the servers, network devices, services and applications. These tools should utilize a combination of ICMP, SNMP, and WMI protocols that enables them to monitor almost

any networked device. Automatic alerting and reporting in multiple formats including email, SMS text messages, and application pop-up windows should also be available.

Event Recognition and management will be provided to restore normal service operations as quickly as possible to minimize the impact on business operations, thus ensuring the best possible levels of service quality and availability are maintained.

Problem management will be provided to minimize the adverse impact of incidents and problems on business caused by errors within the IT infrastructure and to prevent recurrence of incidents related to these errors.

Physical and logical problems use the same problem management procedure within Wipro, as defined in the diagram below.

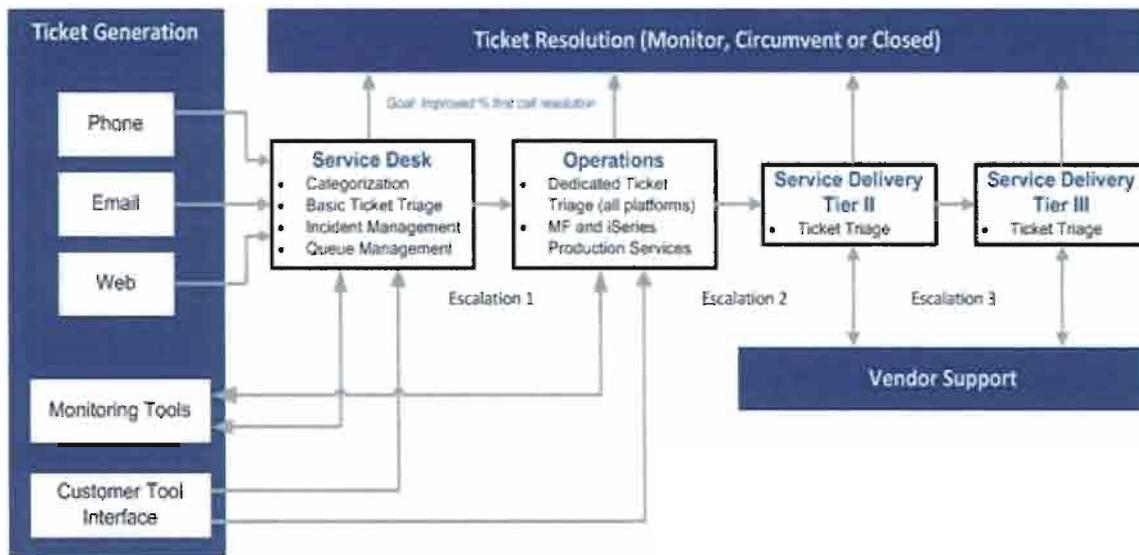

Figure IV-173: Wipro's Mature Ticket Escalation Process

Any chronic or recurring problem initializes Wipro's service improvement process to correct a deficiency in our service not achieving expected service levels. When a deficiency appears requiring actions beyond our problem management process, a team of Wipro employees with appropriate skills is convened to develop a service improvement plan. Once the plan is developed, it is presented to the State and internal Wipro management for approval. The plan is implemented along with appropriate measures.

Results from the plan implementation are compared to service levels – this process is repeated until service levels are met.

Wipro is associated with industry groups and standards such as the Quality Assurance Institute (QAI) and the Information Technology Infrastructure Library (ITIL) ensuring our practices are in-line with industry standard "best practices". These associations also assist us when implementing new procedures and practices as needed.

Wipro focuses on continuous service improvement (CSI) to correctly track the appropriate key performance indicators along with resolving issues effectively. Our internal service delivery process ensuring operations activities are optimized is Wipro's Continuous Service Improvement Vision.

Detailed post incident reports (PIR) are published for severity 1 problems to document root cause and correction actions taken to resolve the problems. The information gathered during a particular corrective process is used to assist the staff in resolution of future similar issues.

The Wipro/IBM team informs the State via primary, secondary and/or tertiary contacts previously established by the State in the contact system. Specific callout procedures are established per State requirements. Contacts are made when severity 1 or 2 network faults or performance issues arise.

Continuous service improvement commitments are not intended to be agreements or contracts in the legal sense, but are intended to provide a formal process by which service problems are addressed and resolved. These commitment agreements are formalized between the Wipro/IBM team and a specific State representative.

After the Wipro/IBM team technical organizations have the opportunity to thoroughly investigate a problem, a meeting with appropriate State of Nebraska personnel to discuss and develop solutions is established.

Event Recognition

As part of Wipro security policy all servers will have Anti-Virus software installed to protect from infections such as virus, worms etc; and will be updated with latest signatures from the Anti-Virus server on daily basis. All servers and network device will be updated with the latest security patches and will be monitored for availability of any security patches using the patch management infrastructure. Role based access will be provisioned for access to the management console with audit trails. All servers and security devices will be monitored real time for security events and alerts will be generated on detection of any security violations.

For the purpose to collect audit logs from in scope log sources the Wipro/IBM team will deploy a local instance of Security Information and Event Management tool at the Omaha Data Center. This appliance will collect, store, correlate audit logs from the production servers, firewalls, intrusion detection systems and other security devices deployed in IT environment and generate alerts on security events. The Wipro/IBM team will also provide "Event Explorer" software module for enhanced data mining, investigation support and reporting capabilities.

Reporting and Communication

- The Wipro/IBM team will provide a portal to enable comprehensive reporting framework that includes incident details , daily monitoring reports, weekly monitoring reports monthly monitoring reports
- Enterprise dashboards will be provided to view all the alerts spread across infrastructure
- Role based access for relevant Reports, views and Alerts will be provided to the Security administrator, Security manager, CISO etc.
- Device level reports can be generated from the portal
- Secure access to download report (in CSV, pdf or html formats) will be provided.

Wipro SOC operations provide reports on daily/weekly/monthly/quarterly/annual basis. Other reports could be created based on incidents/events or as part of vulnerability alert/advisories.

Following is a table of typical reports generated for a customer:

Table IV-53: Security and Operational Reports – SOC

Reporting List	Daily	Weekly	Monthly	Ad hoc
Security Event Reports				
Event Count Reports (based on Attacker, Severity, Target Port, Asset Priority, Device)		✓		
Events Based on Asset Group Report		✓		
Event Summary Report	✓			
Event Trend Chart Report		✓	✓	
Top 10 Security Reports (Attacks, Attackers, Targets, Events)		✓	✓	
Compliance Report (authorized change)			✓	
Vulnerability Reports				
Exposed Vulnerability Report			✓	
Asset Group Vulnerabilities Report			✓	
Critical System Vulnerabilities Report			✓	
Case Reports				
All Case Reports		✓		
Case Chart Report		✓	✓	
Operational Impact Chart Report		✓		✓
Cases Today Report	✓			
Custom Reports				
Delta Chart Attacks by Business Unit Report				✓
Alerts and Advisories Report (prioritized vulnerability)		✓	✓	
Service Level Agreement and Measurement Report			✓	

These reports are available to the State of Nebraska through the Wipro SOC Portal, as shown below and moreover, these reports shall be generated and exported in three different formats: PDF, CSV and HTML.

The portal will be accessible to the State of Nebraska on a 24x7 basis with adequate role based access control.

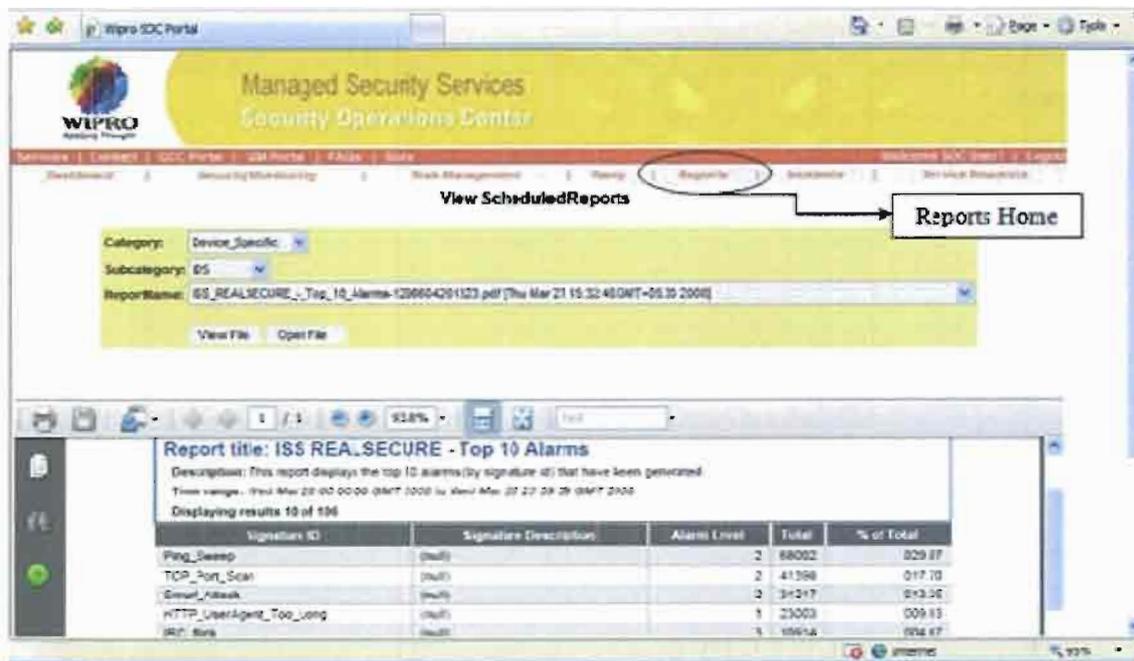

Figure IV-174: Graphical Operations Reports Available Through Wipro's SOC Portal

Reports will be created by security operators and reviewed by security analysts or other senior SOC staff; this will provide accuracy and a review mechanism of all reported data.

Table IV-54: Performance Standards

Performance Standard	Standard SLA
Server Availability	99.0%
Data Center LAN Availability	99.50%
Data Center SAN Availability	99.0%
WAN Availability	99.50%
Internet Availability	99.90%
Critical Data Restoration Request (initiate a restore of data from tape)	Commence restore w/in 4 hrs of receipt of request - No more than 2 requests per month >4 hrs
Off-Site Tape Storage Verification (SLG) (insure all data backed up onto tape, designated to be rotated offsite and has been properly stored offsite)	100% of tapes are sent off-site w/in 24 hours
Network Packet Delivery	99.00%
WAN Service Network Latency	<180 ms per connection
Customer Service Order Completion (SLG) - Customer Service Orders (CSOs) completed in a timely fashion.	Low Volume <50; <=5 CSO's exceed the completion date required or 90% on-time
Change Implementation Success (SLG) (successfully implement changes within	Low Volume <50; <= 5 Changes complete with a failed status per month or 90% success

Performance Standard	Standard SLA
the Customer's environment)	
Disaster Recovery (SLG) (restore critical systems at an alternate facility in the event of a declared disaster at an Wipro Center)	Restored systems are operational w/in 48 hrs
Service Desk – Speed of Answer	Customized based on Customer Business Needs
Service Desk – Abandon Rate	Customized based on Customer Business Needs
Service Desk – Provision (User Administration)	Customized based on Customer Business Needs
Service Desk – Incident Response	Customized based on Customer Business Needs

PREVENTION: Wipro data centers are based on fault tolerant engineering to provide non-stop operations. In addition to these design preventive measures, data center sites are located away from industrial areas, airports, railways, and interstate highways. Most site locations have no documented earthquake or tornado activity.

CONTINUANCE OF SERVICE: Wipro will assist the State of Nebraska in the event of a disaster at a Wipro data center. Specific recovery services provided by Wipro include (but are not limited to):

- Shipment of tapes to the State of Nebraska's disaster recovery location in Tempe Arizona
- Management and coordination of recovery operations
- Provision of appropriate technical resources during the recovery process

An example of Wipro's service management model, including Service Level Agreement, service reporting and meeting charter is as follows:

Performance Tuning

Tuning system performance involves the monitoring of, measurement of, and adjustments to the various components of the system to improve its overall performance and availability. The goal of performance tuning is to increase the throughput and efficiency of the processor, memory, and input/output (I/O) subsystems in order to accommodate the activity and workload requested of the system.

Monitoring

Wipro monitors system performance of processors and peripheral devices using a variety of products to track response times over a range of intervals, and to examine response time summaries of individual logical units of work of any period thought to have a performance problem. To take full advantage of this capability, the State of Nebraska must configure an agent in the application to enable Wipro's monitoring systems to perform response time gathering and collection of data.

Measurements

Wipro collects statistics of historical system data – measured over regular intervals – in order to establish a baseline of system performance. The baseline statistics are used to measure the differences in system performance after tuning implementation.

Gradual or significant changes in key performance indicators are recorded and an explanation regarding the cause of each change is documents. The purpose of threshold alerts is to notify Wipro personnel prior to a shortage of resources in a client's system.

System Adjustments

Predefined corrective tasks automatically initiate to relieve the resource shortage when a threshold alert occurs.

- Typical monitoring and subsequent adjustments Wipro performs for servers include:
- Processor, memory, I/O subsystems and storage adjustment
- Alert and threshold setting revision
- System priority amendment
- Processor, memory, I/O subsystems, and storage performance measurement analysis

9. Compliance with Federal HIPAA, HI-TECH and State of Nebraska Confidentiality Law

The EES Contractor acknowledges its duty to become familiar with and comply, to the extent applicable, with all requirements of the Federal Health Insurance Portability and Accountability Act (HIPAA), 42 U.S.C. § 1320d et seq. and implementing regulations including 45 CFR Parts 160 and 164. The Contractor also agrees to comply with all State of Nebraska Privacy Policies.

The Contractor shall maintain the privacy and security of all individually identifiable health information acquired by or provided to it as a part of the performance of this contract. The Contractor shall follow federal and State of Nebraska law relating to privacy and security of individually identifiable health information as applicable, including the Health Insurance Portability and Accountability Act (HIPAA) and its federal regulations.

Protected Health Information as defined in the HIPAA regulations at 45 CFR 160.103 and 164.501 means information transmitted that is individually identifiable; that is created or received by a healthcare provider, health plan, public health authority, employer, life insurer, school or university, or healthcare clearinghouse; and that is related to the past, present, or future physical or mental health or condition of an individual, to the provision of healthcare to an individual, or to the past, present, or future payment for the provision of healthcare to an individual. The definition excludes certain education records as well as employment records held by a covered entity in its role as employer.

Based on the determination that the functions to be performed in accordance with this RFP constitute Business Associate functions as defined in HIPAA, the EES Contractor shall execute a Business Associate Agreement as required by HIPAA regulations at 45 CFR §164.501.

The IBM/Wipro team acknowledges our duty to become familiar with and comply, to the extent application with all requirements of the Federal Health Insurance Portability and Accountability Act. We also agree to comply with all State of Nebraska Privacy Policies.

The IBM/Wipro team will maintain the privacy and security of all individually identifiable health information and will follow federal and State of Nebraska's law related to the privacy and security of individually identifiable health information.

The Wipro/IBM team agrees to execute a Business Associate Agreement, as required by HIPAA.

Wipro will ensure alignment with, and incorporation of, industry standards: the HIPAA privacy, security and transaction standards; accessibility standards established under section 508 of the Rehabilitation Act, or standards that provide greater accessibility for individuals with disabilities,

and compliance with Federal civil rights laws; standards adopted by the Secretary under section 1104 of the Affordable Care Act; and standards and protocols adopted by the Secretary under section 1561 of the Affordable Care Act.

Wipro acknowledges and will comply with all State of Nebraska Privacy Policies.

Wipro acknowledges and will comply with State of Nebraska law relating to Privacy and Security of individually identifiable health information as applicable, including the Health Insurance Portability and Accountability Act (HIPAA) and its federal regulations.

Wipro will maintain the privacy and security of all individually identifiable health information acquired by or provided to it as a part of the performance of this contract.

10. Data System Access

The Contractor agrees that all information accessed in the State of Nebraska computer systems is the sole property of the State of Nebraska; Contractor employees are granted access to this under the terms and conditions of this Contract. All information collected and compiled by the Contractor under the terms and conditions defined in this Contract is the sole property of the State of Nebraska and subject to all privacy and security safeguards defined by the State of Nebraska.

The Contractor agrees that under the terms and conditions of the contract resulting from this RFP, that the State of Nebraska computer system access will only be granted to employees or subcontractors approved by the Department.

The Contractor agrees that under the terms of this contract they are responsible for ensuring all State of Nebraska approved subcontractors understand and agree to abide by the same terms and conditions defined in this contract.

The Contractor agrees that unique access logon accounts into the State of Nebraska's data systems will be assigned to an individual and that logon account may only be used by the individual to which it is originally assigned.

The Contractor agrees to access the State of Nebraska data systems only through State supplied CITRIX access and encryption technology.

The Contractor agrees to meet compliance requirements for all applicable State of Nebraska and federal physical, administrative, and electronic safeguard standards (as per safeguard publications listed below) and abide by State of Nebraska Information Technology Policies that govern the appropriate use of disclosure of privacy of and security of information provided by the State under the terms and conditions defined in this Contract.

Wipro's Data Systems approach for physical access into the Data Center in terms of organizational procedures is as follows:

Physical:

- Limit access to the building by a single card-key controlled entrance adjacent to the security station. Visitors must register at the security station and be escorted during their entire stay inside the building.
- No breaches of Wipro's physical security practices have ever occurred.
- Computerized, multi-level card-key access system provides internal screening and access control for all personnel

- Security officers are on duty 24 hours a day, 7 days a week, monitoring activity both inside and outside the building from display screens in the security station
- Multiple fixed and pan-tilt-zoom cameras on the exterior of the facility provide 360 degree coverage of the immediate and adjacent areas

A camera monitors all access through the main entrance to the facility. Cameras monitor access to, and all hallways within, the computer operations areas of the facility. A complex of pan-tilt-zoom cameras monitor all movements and activities inside the telecommunications and computer room areas.

Furthermore physical and logical separation is guaranteed whenever Wipro supports employees or subcontractors accessing the Data Center. Visitors/vendors must register at the security station and be escorted during their entire stay inside the building. Customer and vendor access is also restricted to “need to access” basis.

Use of PVLAN separation and firewalls prevent access between customers via any leveraged infrastructure. If required, Wipro can provide dedicated monitoring and management infrastructure vs. the standard leveraged platforms.

11. Safeguard Publications

- a. Health Information Portability Accountability Act of 1996 (HIPPA—privacy rule 45 CFR Part 160 and subparts A and B of Part 164)
- b. HIPPA – Security Rules 45 CFR Part 160 and subpart A and C Part 164
- c. Internal Revenue Service (IRS) Publication 1075
- d. Social Security Administration (SSA) – Computer Match Agreement
- e. DHHS Information Technology Policies

The Contractor agrees that the State of Nebraska or federal agencies with jurisdiction (i.e., OCR, IRS, SSA, DHHS, or State of Nebraska Auditor’s Office) may conduct unannounced compliance inspections related to the physical administrative and electronic safeguards defined in the publications listed above.

The Contractor understands that it will be held responsible for all criminal and civil penalties for actions of the subcontractor as defined in the publications listed above.

The Contractor agrees to immediately notify the State of Nebraska’s HIPPA privacy/security office of any suspected loss of, threat of, inappropriate disclosure of, unauthorized access of, or destruction of and/or corruption of Departmental information obtained from Departmental computer systems and agree to comply with incident reporting criteria as defined in their BAA and the publication listed above.

The Contractor agrees to immediately notify the State of Nebraska of any lost or stolen computer hardware that may have been used to access, process, or store State of Nebraska information or State computer systems.

Contractor agrees to comply with State of Nebraska Breach Notification Law Revised Statute 87-802 any time there is a suspected loss of personal information as defined in the revised statute.

The Contractor agrees that no State of Nebraska information will be stored on a personal device and all State of Nebraska information stored, processed, or otherwise transmitted will be performed on State of Nebraska resources accessed through CITRIX or through the State of Nebraska secure e-mail system.

Wipro acknowledges that the State of Nebraska (or its Auditor’s Office) may conduct unannounced compliance inspections related to the physical administrative and electronic safeguards as defined. All notifications will expeditiously be made, if/upon any suspected loss, threat or unauthorized access or destruction of State Departmental information. At no time will any State information be stored on a personal device and/or will information be transferred therein.

12. Warranty

The Bidder must provide a narrative overview of how the proposed solution will meet the EES requirements. The following response requirements pertaining to the Non-functional Requirements for the EES and must be responded by the Bidder.

Provide specific details of the proposed approach to meeting the State of Nebraska’s requirements in each area. Also, include one or more diagrams where necessary that detail the proposed design and the relationships between key technical components.

Responses in this section must be highly-focused on the specific requirements and must not simply provide generic or marketing descriptions of technology or product capabilities.

- i. Describe the proposed approach to system warranty, including the type of warranty being offered. In addition, provide a summary of the Bidder’s proposed strategy for supporting that warranty. Please address the following areas (at a minimum):
 - a. Four-Year Software Warranty;
 - b. Staff Resources and Supporting Equipment; and
 - c. Meeting Service Level Requirements (SLRs)

Wipro commits to supporting an Eligibility and Enrollment System Stabilization period and to ensuring the system meets requirements after rollout.

Upon deployment and acceptance of the original EES Project scope, Wipro is committed to provide a 180 calendar day warranty for all “corrective” maintenance, modifications and support to stabilize system performance within agreed upon Service Level Requirements and the original scope of the software development effort.

Wipro will assume responsibility for the root cause analysis activities to demonstrate whether a defect is related to the original functional scope. There will be necessary governance procedures in place to identify if a work item is classified as change or enhancement to the system or defect. Any item identified as defects would be covered under warranty at no additional cost to the State.

Wipro will provide required fixes within the reasonable timeframe (depending on severity as defined in the table below) and will produce at no additional cost to the State of Nebraska.

Table IV-55: Production Defect Severity

Production Defect Severity	Response Time
Severity 1 - The EES no longer functions at all, or a System component is unavailable to more than 20% of active production users.	4 Hours

Severity 2 - Any defect that affects less than 20% of the EES functionality or less than 20% of active production users.	8 Hours
Severity 3 - The EES is able to function with a temporary workaround.	72 Hours

The Wipro/IBM team will provide the equipment necessary to support its staff for the duration of the Warranty period.

The system support process will be mutually agreed upon before start of the engagement.

Maintenance Program

Upon expiration of the 180-calendar day warranty, the Wipro/IBM team will provide a fee-based maintenance program for the duration of the contract, including renewal periods. The annual maintenance program will have all necessary details to ensure adequate technical support, updates and fixes necessary to operate the solution in manner prescribed.

Meeting Service Level Requirements (SLRs)

The Wipro/IBM team will provide Maintenance methodology, approach and processes based on the Federal Exchange Life Cycle SDLC template entitled ***Service Level Agreement / Memorandum of Understanding***. This document will be mutually agreed and signed-off before completion of 180-calendar day warranty phase. Once approved, the SLA/MOU will be placed under Change Management, and published through the project's document management system.

The Service Level Agreement / Memorandum of Understanding will address the following topics and will include the above mentioned Production Defect Severity and Response Times.

Introduction

- Scope
- Background
- Audience
- Assumptions
- Roles and Responsibilities
- Contacts

Service Details

- Requirements
- Service Level Expectations
- Escalation Actions
- Service Provider / Service Recipient
- Service Hours for Problem Resolution
- Performance Guarantee
- Agreement Change Process

13. Software Maintenance and Operations (M&O)

- i. Describe the approach for providing ongoing maintenance and support services, including a flexible and scalable approach to providing the various types of personnel, including:
 - a. Architect;
 - b. Business Analyst/Functional Lead;
 - c. Communication/Network Specialist;
 - d. Database Administrator;
 - e. Help Desk Specialist;
 - f. Hardware Specialist;
 - g. Operations Lead/Manager;
 - h. Project Manager;
 - i. Programmer;
 - j. Security Systems Engineer; and
 - k. Systems Administrator.

Wipro offers tailored options such as flexible delivery (flexible staffing with a core team to manage demand fluctuations); shared / co-existence delivery teams between client and Wipro/IBM teams (logical allocation of roles and responsibilities); component-based engagements (such as L3/L4 only, or module-based, or business unit-based).

Although responsibility for resolution is handed over to another support group/level, the service desk retains ownership of the incident, and manages it until it is resolved to the customer's satisfaction.

The above explained methodology for ticket resolution shall be followed in the proposed delivery model for this engagement with Nebraska.

A service center for Support (Flex) is laid out along multiple layers like Development Factory, with each layer performing a set of services that tie in with the overall objectives.

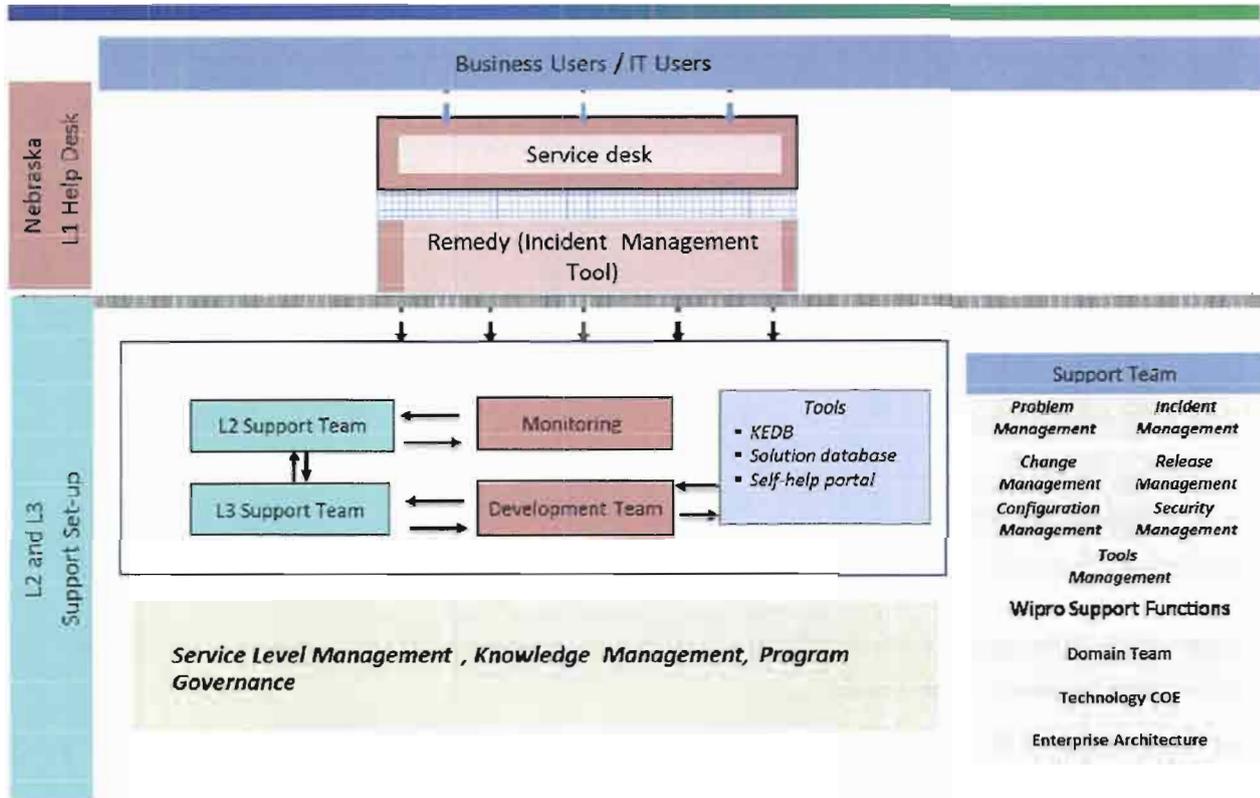

Figure IV-175: Support Engagement Divided into Core and Flex Teams

As can be seen from the above illustration, the Wipro/IBM team shall divide the support engagement into Core and Flex teams. The core team shall be responsible for solving critical and high priority tickets, preventive maintenance, quality assurance, and process improvement initiatives. The core teams for Nebraska shall be aligned into process areas and shall have its own dedicated core team since there are many region specific customizations into the applications. The core team shall consist of process experts, application specialists from EDW, Reporting and BI.

The Flex team on the other hand, is a shared competency team based offshore which shall be shared across the landscape. This team shall have process and application experts and shall be involved in the providing support for common business process areas which are common across geographies. The Flex team shall be divided into 4 teams:

1. **Service Desk:** First point of contact of business users responsible for and resolving simple How-To and other trivial application queries/request after due enablement. Service Desk is typically the initiator of the Incidence Management process.
2. **Centralized Services Team:** is typically the Demand Queue Manager and responsible for convergence of ITSM processes, custodians of Knowledge Bank, encourage knowledge sharing and Service Management. They ensure that all the entities have a consistent experience and their requests are adequately addressed. This team has process Specialists comprise of ITIL trained experts who have end-to-end knowledge of FT processes and shall implement various processes like Change Management, Release Management, and Incident Management etc.

3. **The Incident and Problem Handling Team:** is aligned to technology and skills to provide Incidence/Problem resolutions for the tickets raised by Service Desk. They shall be responsible for solving low priority tickets and activities like regression testing, problem management etc. This team provides adequate support coverage as desired by various entities.
4. **Application Monitoring and Preventive Maintenance** shall be responsible for all batch jobs and monitoring activities as and when needed/defined for various entities.

The Wipro/IBM team intends to implement an ITIL v3 based process for application maintenance and support complaint process for the below two ITIL service support components:

- Incident Management
- Problem Management

Wipro follows a robust ticket resolution methodology based on the ITIL standards which clearly outline the ticket resolution process from ticket initiation to closure. The illustration below outlines this process in detail:

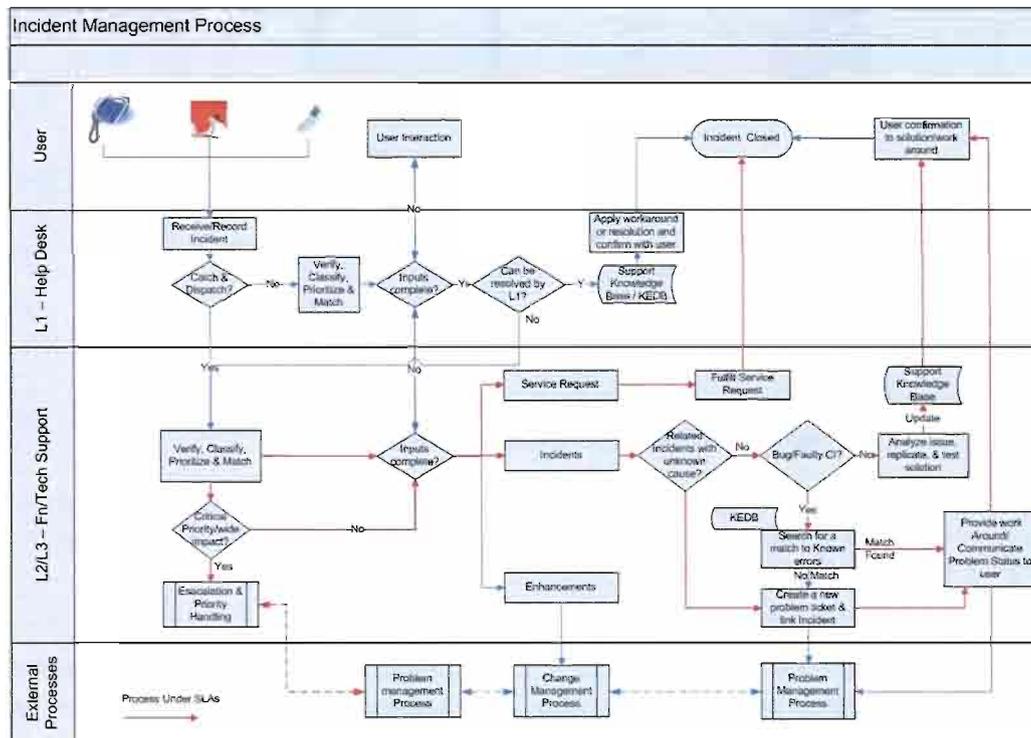

Figure IV-176: Ticket Resolution Methodology

Ticket Initiation - Helpdesk/Users/Super users at FT raise the tickets. Each ticket is logged into the Ticket Tracking system of individual countries Help Desk (except for Spain where it is done by Wipro) which is then interfaced to Wipro's Ticket Tracking Tool HPSM. The User or the Level 1 help desk classifies the tickets into severity levels. These tickets are further analyzed by Level 2 and Level 3, who prioritizes them for implementation.

Ticket Resolution - The ticket resolution process starts at the Level 1 help desk, and moves on to Level 2 and 3 as required. As tickets are analyzed, Wipro updates the status information into the ticket tracking system. Workaround solution may be offered to the users, depending on the type, nature, and priority of a ticket. In such cases, permanent resolution is deferred to a later stage, and is taken up after detailed analysis followed by a formal change management review process.

The system can be configured to automatically trigger an escalation process, when resolution timelines are not adhered to by the respective help desks.

Ticket Closure - All tickets are closed once validated by the User and also simultaneously in customer's ticket tracking tool.

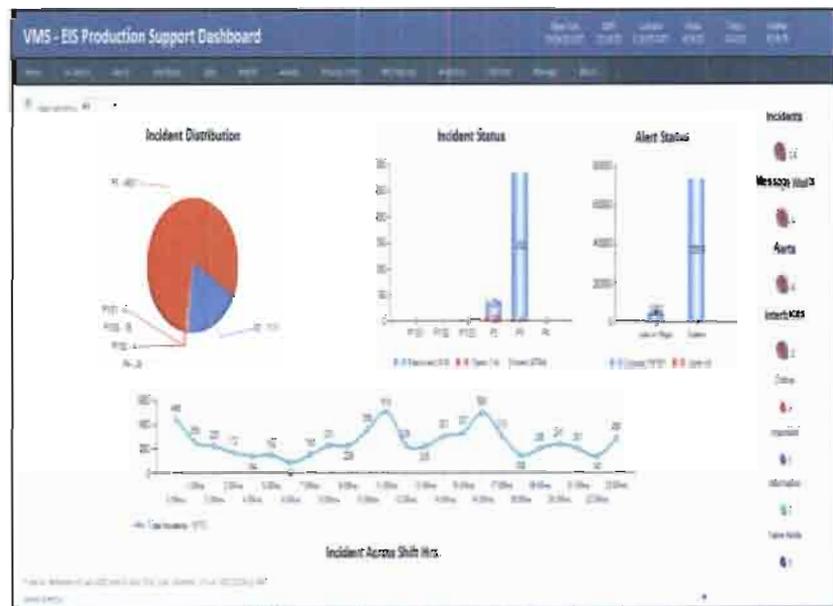

Figure (V-177): EIS Production Support Dashboard

ii. Describe the approach to system operations support, including the levels of support offered and the process for requesting support. In addition, provide a summary of the strategy for maintaining and repairing the system. Please address the following areas (at a minimum):

a) **Base Software Maintenance Period**

The Base M&O period includes the “adaptive” maintenance/modification of the EES performed after completion of deployment to keep the EES usable in a changed or changing environment, and “perfective” maintenance which is modification of the EES after completion of deployment to improve performance or maintainability. During this period, Wipro shall be in charge of Software Maintenance, and hosting and operating the EES platforms and underlying technologies, and providing Disaster Recovery services.

The Base Maintenance and Operations (Base M&O) period shall be four (4) years from the projected date of January 1, 2016.

b) **Incident and maintenance request reporting**

Visual Monitoring System (VMS) is a real time alert and incident monitoring tool. It's a single interface showing all the incoming alerts at one shot providing online visibility to L2/L3 team on the flow of alerts. Monthly reports on the flow of alerts help us in identifying the root cause and thereby propose permanent fix to customers.

Features of VMS:

- Real time monitoring and reporting of alerts and incidents categorized on business criticality and priority across multiple shifts
- Provides queues for monitoring alerts in a categorized manner with business criticality/priority
- Provides information on incident trend across Shift hours
- Provides a number of MIS reports and Analytics for
 - Alert trend across months
 - Alert funnel to showcase distribution
 - Incident trend

Benefits of using VMS:

- Acts as a window/portal to understand what is happening in the respective support engagements
- Team leads and managers can use this to understand where we stand on open alerts and incidents at any given point in time
- Helps in avoidance of missing important alerts. Widely used mechanism of email notifications is typically prone to human errors/or missing important alerts
- Provides feature like instant messenger which is platform independent
- Offers lots of benefits like 360 degree view of alerts and tickets (without having to login into different tools), Alert prioritization and categorization, SLA discipline enforcement, job views, trade processing flow, analytics, MIS enquiries.
- Integration with KEDB helps faster turnaround time for tickets.

c) Optional Extension Software Maintenance Period.

At the expiration of the Base M&O period, the State of Nebraska may elect to enter optional renewal M&O Period(s). The scope of services covered under the optional renewal M&O Period(s) will be the same as the Base M&O period.

Wipro agrees to propose two (2) two-year renewal M&O periods. The State of Nebraska shall be able to exercise its option to sign-up for the same services to those offered in the warranty and Base M&O period.

Scalability and flexibility

The Wipro/IBM team understands that Capacity Management ensures that the capacity and performance of the IT services and systems match the evolving agreed demands of the business in the most effective and timely manner. The main objective of the our capacity management team is to understand and define the procedure for preparing the capacity plan by monitoring and analyzing

the capacity of resources and to ensure the Support team, at all times, sufficient capacity to meet the current and future agreed demands of the State's needs.

The Wipro/IBM team works with State of Nebraska team and helps balanced Capacity Management process and planning, being involved at all stages of the service life cycle from planning to operations and to improvement.

- Balancing costs against resources needed
- Balancing Supply against Demand

The capacity management process is described in the diagram below.

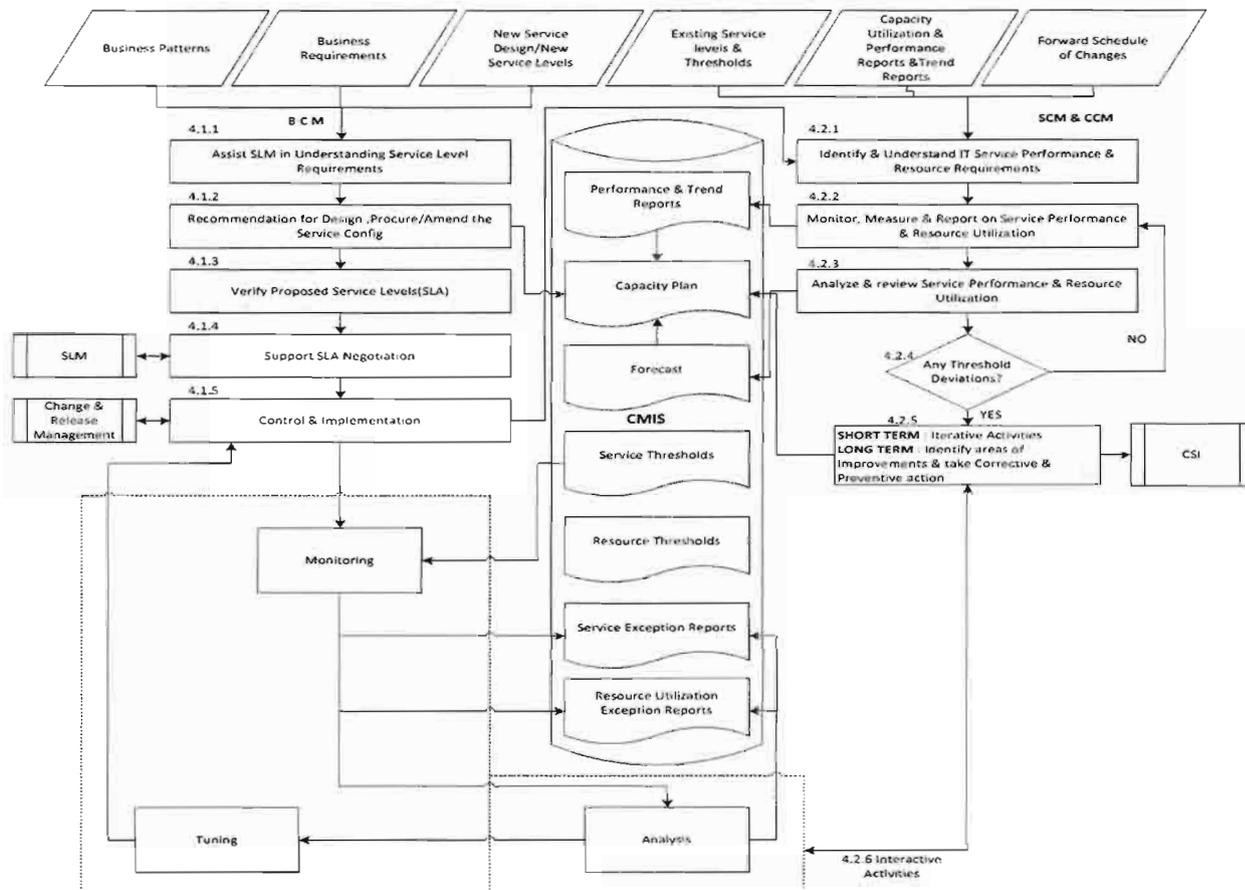

Figure IV-178: Capacity Management Process

Defect resolution and Solution Acceptance

iii. Describe the proposed approach to Defect Resolution and Solution Acceptance that shall incorporate methodologies and practices which will assist the State of Nebraska to successfully manage the enterprise's M&O lifecycle phase and shall address at least the following areas:

- Support Model;
- Triage Procedures;
- Tools;
- Roles and Responsibilities of support personnel;
- Release Management;

- f. Upgrades;
- g. Maintenance;
- h. On-going Operations;
- i. Customer Support;
- j. Specific support procedures for production;
- k. Deliverables;
- l. Capacity Management;
- m. Technology Refresh;
- n. Solution Security;
- o. Backup and Recovery;
- p. Disaster Recovery; and
- q. Defect/Issue Management.

Defect Resolution is the practice of identifying, tracking and resolving the errors or defects found in all stages of the Software Development Lifecycle (SDLC). Defect Management is the process of detecting, analyzing, taking corrective action and resolving defects. Therefore defect management is a critical factor in the testing life cycle as the effective management of defects in any given Software Development Lifecycle is a key to its successful delivery

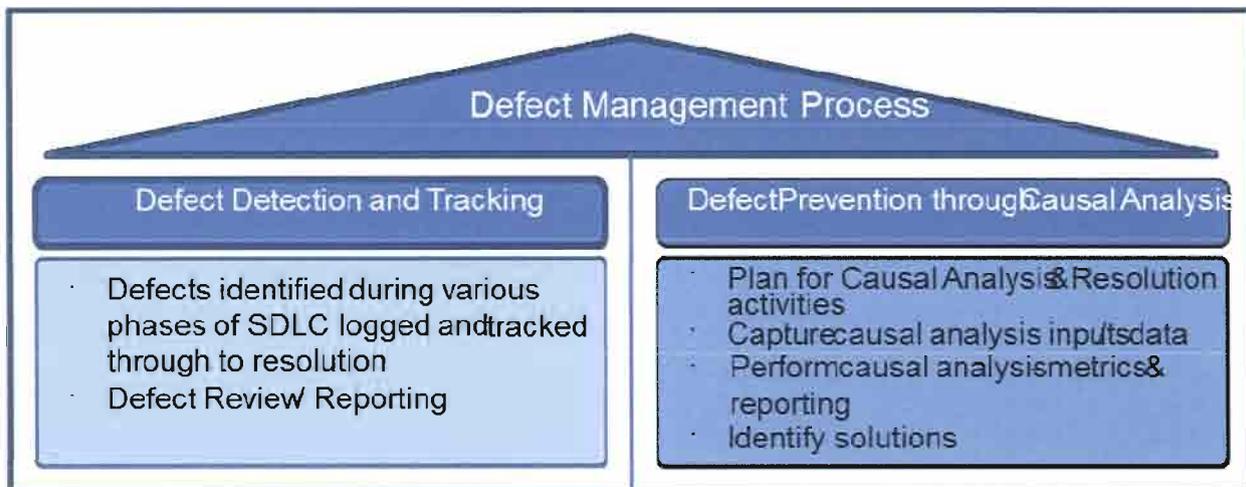

Figure IV-179: Defect Management Process

Following defect detection, defects are tracked through a set of work activities and processes through to successful resolution.

Defect Prevention through Causal Analysis

Defect causal analysis is undertaken to identify the causes of defects and to take action to prevent defects from occurring at any time in the future.

Defect prevention activities are initiated when a project is started and continue until the end of the project.

Defect Prevention helps in:

Identifying the most commonly occurring defects,

Identifying process changes and other corrective actions to ensure that the most common defects are eliminated within each phase, and

Continuous review and improvement of processes which will ensure more effective defect detection and defect prevention techniques within the testing lifecycle starting from the requirements analysis phase through to the completion of the test execution and test sign-off phases.

Solution Acceptance

Defect fixes will be developed and tested by the Development team and delivered to the designated test environment for re-test within the agreed timeframe. Any subsequent defects found while retesting a defect fix must be logged as new defects.

The release processes and timeframes for the code fixes to be delivered to the test environment will be discussed and agreed between all relevant parties in the Defect Triage Review Meetings.

Defect fixes will be tested as is appropriate to the nature of the defect. Regression testing will be undertaken as required to verify that the defect fix has not caused regression of any code. This testing will be undertaken by the Test Analyst as part of the retest.

Where the defect is confirmed as an error or omission in the baselined requirements and/or design this will constitute an enhancement and require a Change Request to be raised by the Program.

Where an enhancement is required the defect will be assigned to the Business team responsible for initiating the program's Change Management Process.

Support Model

The following diagram provides a high level overview of the key activities and resource groups required to support the Defect Management Lifecycle within the project.

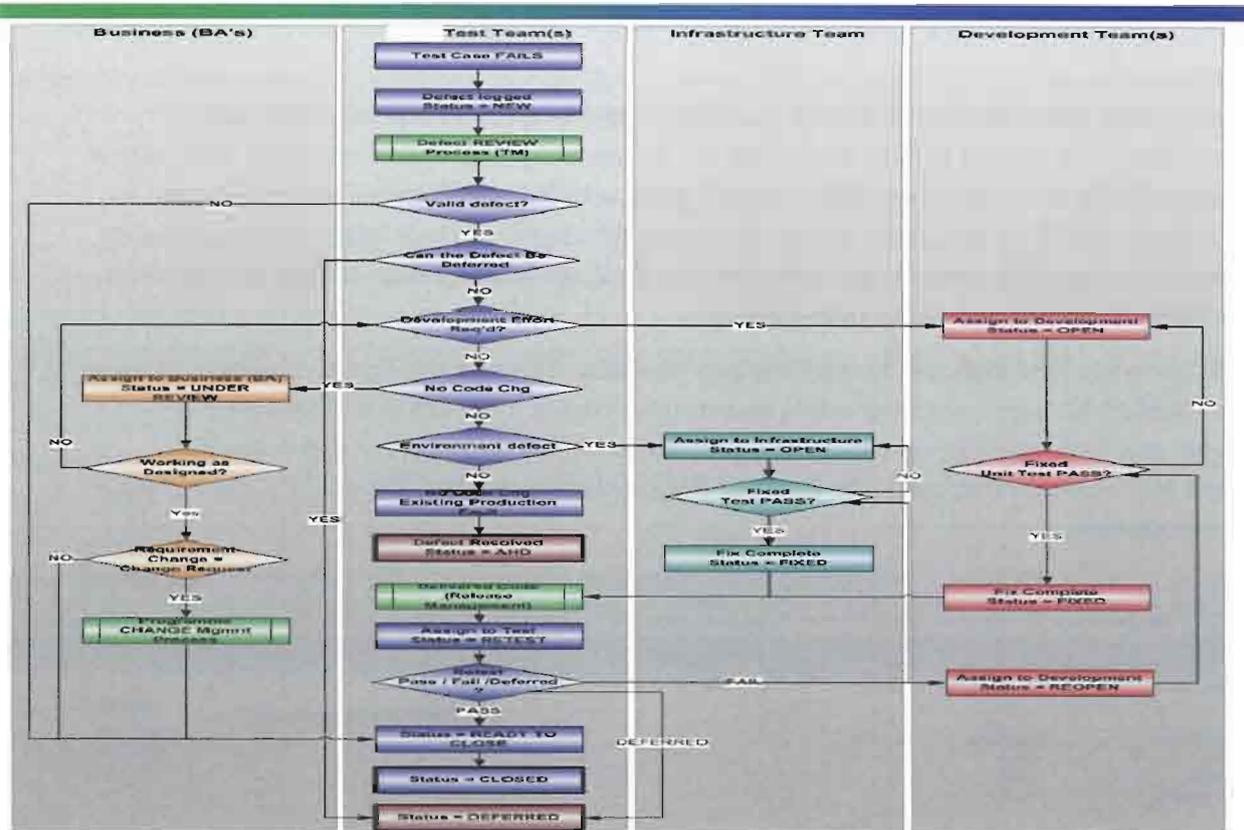

Figure IV-180: Defect Management Lifecycle

Triage Procedures

The Defect Triage Process entails the assessment of the defects to ensure that they are channeled appropriately through the defect lifecycle. This entails the quality review of the defects by assessing the accuracy and completeness of the defect detail in terms of description, severity, priority, impact assessment, etc. with feedback to the defect originator if corrections or clarifications are required.

Factors that influence this process are:

- Defect Severity,
- Defect Priority,
- Frequency of usage of a failed feature or function,
- Defect resolution estimates,
- The complexity of the resolution,
- Schedule – e.g. Go-Live or deployment deadlines,
- Dependency on another defect,
- Availability of a resource with specialised knowledge, and
- Work already taking place on similar or related defects.
- The Test Manager/Team Lead will be responsible for confirming the defect is assigned to the appropriate team for resolution.
- Where a code fix is required the defect will be assigned to the Development team responsible for resolution.

also provide input into the Change Request assessment process as required i.e. impact assessments, time/effort estimates, regression implications etc.

Defects Review Team - The Defect Review team will be a group who possess the expertise and knowledge to review and confirm the defects raised across all solution work streams/components. This will involve a comprehensive knowledge of the system requirements and underlying design.

Development Team - The Development team will have a number of responsibilities in the defect lifecycle. Predominantly this will involve the responsibility for analysis, design, build and unit test of defect 'fixes'.

Business Team- Business Analysts are primarily either Subject Matter Experts (SME's), from the operational business areas, or Business Analysts who have worked with the SME's in defining requirements.

Infrastructure Team - The test team will log an environmental defect in Quality Center (QC) and assign to the Technical Project Manager. It is TPM's responsibility to update QC when the defect has been fixed and reassigned back to the Test Manager/Team Lead

Release Management

The RM activities are to manage deliverables effectively across Development, Controlled Test and Live Environments. The following gives summary of key activities, most of which are process driven for its effectiveness.

Release Policy and planning - The Release policy covers Release numbering and naming scheme, Release frequency and definition of type of releases. Description of the RM control process like progress assessments, review meetings, escalations, impact analysis. Defining roles and responsibilities of RM and its interface responsibilities and staffing. Interface with Configuration Management Database (CMDB) and acceptance criteria guidelines.

- Release design and build - This is collection of many Release involved activities which forms key to Release Management governance. This includes (but not limited to)
- Design and automated error free release builds,
- Documenting tested RIGs (Release Installation Guides),
- Configuring Release units and associated s/w licenses,
- Quality control procedures for release items,
- Build and test back-out procedures etc

Release Acceptance - Release build is accepted for System and Integration testing and then for acceptance testing, operations reading testing and finally to production Go Live. At each stage of acceptance, relevant entry and exit criteria are set and verified. Though the basic elements (like Functional and non-functional requirement test reports, Release pack with sanitized builds) are part of standard checklist, the outstanding error levels with which the release will be considered will depend upon the scale and purpose of the release.

Release Rollout and sign off process - Release implementation and roll out strategy depends on the nature and purpose of the release. Data migration and sample Go Live can be verified if applicable to reduce roll out risks.

Communication and Training - Training on release content and its usage becomes critical for business users and acceptance testing. Users can be kept in loop in the roll out phase activities and the release plan and release mechanism process. This streamlines release acceptance and also users are made known about outstanding defects and capabilities of release.

Release Pre and Post Audit - The release review checklist provides pre audit of release, which along with elements of acceptance entry criteria, should have Audit on Release content Vs requirements. This gives list of items which have not been released as part of release.

Deliverables

Defect reporting provides the program with a means of both tracking the progress of defects through the lifecycle as well as providing a means to predetermine 'Defect Repair' schedules and release/delivery dates.

The following describes the level of defect reporting to be available to the program:

- Open Defects by Severity / Priority (not closed)
- All Defects by Severity / Priority
- Defects by status
- Open / Closed Defects 'This Week'
- Defects targeted for next release/delivery
- Open / All Defects by Severity / Test Type
- Open / All Defects by Severity / Defect Cause
- Ad-hoc defect queries and reports as required.
- Defect Aging

Capacity Management

The Wipro/IBM team understands that Capacity Management ensures that the capacity and performance of the IT services and systems match the evolving agreed demands of the business in the most effective and timely manner. The main objective of the our capacity management team is to understand and define the procedure for preparing the capacity plan by monitoring and analyzing the capacity of resources and to ensure the Support team, at all times, sufficient capacity to meet the current and future agreed demands of the State of Nebraska's needs.

The Wipro/IBM team works with State of Nebraska ITO team and helps balanced Capacity Management process and planning, being involved at all stages of the service life cycle from planning to operations and to improvement.

- Balancing costs against resources needed
- Balancing Supply against Demand

The capacity planning process includes

- Gather the resource and application component performance thresh holds
- Maintain an appropriate and up-to-date Capacity Plan, which reflects the current and future needs of the business

- Analyze and provide advice and guidance to all other areas of the business and IT on all capacity and performance related issues
- Assess the impact of changes on the Capacity Plan
- Ensure tuning activities to make optimum and efficient use of existing resources
- Proactive Capacity and performance measures

Technology Refresh

Various factors can contribute to the need for technology refresh; changes in these factors need to be monitored and reviewed on a regular basis to ensure an effective IT asset base. The Wipro Architect assigned to CLIENT, in conjunction with the Tower Leads and the Procurement team will work extensively with CLIENT on the status of technology in the CLIENT environment. As part of our normal Governance Process we will discuss Refresh Policies and Technical Currency.

Key Factors leading to Technology Refresh

- *New technologies* – new technologies that that can reduce costs or differentiate State of Nebraska offerings to its clients. New technologies are constantly reviewed by Wipro’s various centers of Excellence, these centers will work extensively with our Architect, who will bring new technology focus to State of Nebraska
- *Compliance and Regulatory requirements* - New laws and regulations require businesses to meet certain IT mandates. Areas that generally dictated by these laws are availability and security related e.g. application and data availability and protection, data retention, change in security policies etc.
- *Capacity Enhancements* – growth in business may demand corresponding change in the infrastructure that cannot be supported by the existing technology or assets.
- *Technology / Asset Obsolescence* – Technology refresh may be caused due to software or other technology drivers, e.g. a Windows Vista requires a SW and HW upgrade, whereas there may be situations where the asset itself is near or past its reasonable functional life. This is indicated by increase in failure rates or End of Service Life announcements by vendors.

Solution Security

When solution security defects are found, they are committed to the defect management database within the IBM Rational Team Concert software tool. As previously described, these defects are categorized by severity and addressed by support personnel. Security defects severity is determined based on HIPAA guidelines and exposure to breaches of health or personal information. If security breaches are determined to have caused health or personal information to be exposed, then a separate defect resolution process is used to incorporate the Office of Civil Rights, CMS, the State and vendor community as well as those individuals whose identify was compromised.

Backup and Recovery

On a scheduled basis, the Wipro/IBM team conducts disaster recovery drills. These drills may uncover defects that might compromise our ability to recover successfully from an actual disaster. With this in mind, the Backup and Recovery defects are categorized accordingly,, with defects that have a higher probably of occurring and a greater impact being prioritized to the top of the defect priority list. As with other defects, defects related to disaster recovery are added to Rational Team

Concert's defect tracking database, and the defect resolution process executed with automated support from the IBM Rational Team Concert defect tracking capabilities.

Disaster Recovery

The Wipro/IBM team proposes to follow a risk-based 360⁰ check and balance methodology to address the Disaster Recovery requirements of State of Nebraska. The scope of disaster recovery requirements as understood by the Wipro/IBM team from the Request of proposal (RFP) and response to questions provided is as follows:

- *DR Planning* – Develop and maintain the data center recovery plans for protected data centers.
- *DR Architecture* – Provide Data Center Disaster recovery strategies and solutions based upon business requirements.
- *DR Coordination* – Provide framework for coordinating efforts across infrastructure teams. Ensure a methodical and synchronized execution of technical recovery procedures following disaster declaration.
- *DR Testing* – Schedule annual DR recovery exercises for each location. Create detailed timelines, schedule checkpoint calls, and manage all aspects of preparation and coordination of events. Document a list of pre-exercise objectives. Publish a post-event summary report, which includes an evaluation of the success level of each objective.
- *DR Operations* – Maintain and update the DR server inventory list in configuration management database (CMDB). Review all change records for impact to recovery solution. Ensure changes are reflected within the DR outsource contract. Keep emergency contact lists maintained for each site. Provide information and data to support business, audits and external client requests, provide data as requested for SOX, SAS70 and CAP audits.

Site level recovery options

Wipro has site level BCP/DR plan in place in order to overcome any contingency situations. Wipro proposes a Warm DR as a site level recovery option for State of Nebraska. Wipro will enable both the sites with required technology infrastructure, seats allocation and WAN bandwidth allocation. In case of a disaster, Priority-1 and critical tasks will be handled by the team in the other city. However we are happy to, discuss other options and can select the appropriate strategies based on your recovery requirements defined through Recovery Time Objective (RTO), Recovery Point Objective (RPO) and business requirements.

Benefits

- Migration to proactive mode of support through cross skilling, optimization and automation
- Server, Storage and Database availability improvement through predictive support
- Improved Service Levels year on year over and above the committed service levels
- Incident cycle time reduction by deploying scriptorium and Healix for Self-Help & Self Heal

Full backups are taken each night on all files and disaster recovery (DR) backups are taken every three days on all files. Wipro contracts with multiple vendors to provide off-site vaulting and storage of media and materials. The secure, off-site storage facilities of Vital Records, Iron Mountain, and

Recall are all used by Wipro. Off-site vaulting and storage is used to provide safe storage for any critical tapes used for DR and any tapes that contain data that would need to be stored over a long period of time. The rotation schedule for disaster recovery tapes dictates that three versions of each DR backup are available in the off-site storage at any time.

Our applications support real time replication to another data center. Our network features a completely redundant architecture with diverse fiber paths. Wipro data centers are connected to high-speed fiber rings that support a full range of wide area networking protocols, including Frame Relay, ATM, T1/3 and OCx. Our network features a completely redundant architecture with diverse fiber paths.

Even if there is a disruption in the physical network, we can provide seamless access to our customers' applications.

Since all of our applications are delivered as an ASP, disaster recovery plans do not affect data at the customer site. Our system and network are constantly monitored by our operations staff in order to maintain optimal performance and response time for our customers. As part of our ASP offering, Wipro provides a Production Support team to monitor our applications 24 hours a day. This team is responsible for all application maintenance of the system, including applying new software releases, scheduling all batches processing, and maintaining and testing and maintaining our disaster recovery plan. Disaster recovery tests are performed yearly.

Defect/Issue Management

The Wipro/IBM team understands that management of issues/problems is critical to a successful transition. Wipro has a robust escalation process to address issues that may potentially have adverse impact on transition activities. Wipro will establish an escalation matrix along with State of Nebraska to address any issues/problems that may impact transition during the transition planning phase. Apart from setting up a Wipro Transition Management Office (TMO) for effective transition management, Wipro will also leverage the governance forums to address any issues.

While at an operational level, Wipro Service Tower Delivery Managers will be the focal points to promptly address any operational issues, Wipro's Transition Manager will be responsible for managing escalations during transition. Issues that have critical impact on transition activities will be immediately notified to key governance stakeholders (State of Illinois ,Wipro and IBM) for quick resolution of the issue .

Issue Management

Table IV-56: Wipro's approach to Issue Management

Approach	Description
Empower teams	<p>Get Wipro Tower lead involved in issue</p> <p>If the issue is not resolved in timely fashion escalate and reach out to the competency team at offshore for assistance</p> <p>Engage State of Nebraska SPOC for assistance</p> <p>The transition team will have a dedicated Critical Incident Manager to assist Wipro/IBM team with issues</p> <p>Wipro Transition Management Office will provide guidance and leadership to the teams</p>

	for any issues and can provide another level of escalation internally or with State of Nebraska
Backlog of tickets and patch management	During the analysis and training phase our teams will review the current service management queues for open issues. We will also work to identify and understand the current levels of patch management and create a gap plan for systems which need updates based upon level of criticality from third party suppliers. Transition management team will work with State of Nebraska on how this backlog should be approached and an agreed to plan will be documented.
Cutover problems	Wipro will attempt to resolve all issues. At times during the cutover there may be support required from State of Nebraska or State of Nebraska provider in order to meet SLA's. During the secondary and primary phase Wipro will understand and document who is the 2nd and 3rd levels of support Wipro can engage if required.

iv. Describe the approach to Solution Administration that shall incorporate methodologies and practices which will assist the State of Nebraska to successfully administrate the EES and shall address at least the following areas:

- a. Archive/Purge of Log files;
- b. Version control capabilities;
- c. Logging and reporting for accessing errors and exceptions and unauthorized access;
- d. Public key/private key encryption Secure Socket Layer (SSL) certificates;
- e. Single sign-on capability and integration with Nebraska's Active Directory authentication and authorization;
- f. Admin tools and maintenance routines;
- g. Firewalls and DMZ for external access and remote access; and
- h. Administration of User Accounts, User Roles, User Groups etc.

DCS operates world-class global data centers and offer extensive expertise with every computing platform, including iSeries, Windows, UNIX and Linux servers, Mainframe, Cloud (iStructure), as well as networking, security and storage systems.

Wipro Data Center Services manages its customers' systems in world-class, purpose built data centers that are fully redundant, fault tolerant, highly secure, and include hardware, software and data communications equipment. Our geographically dispersed data centers total more than 430,000 square feet. Our data centers listed below undergo SSAE16 audits, and are PCI certified. (Wipro Data Center Services manages six data centers within the continental United States and one in Meerbusch, Germany).

Single Sign-on

The SmartPro MedEE solution uses JBOSS SSO to facilitate federated single sign-on. This solution allows users to enter their ID and password just one, and then be credentialed to various applications. In conjunction with the state's identity management solution, the SmartPro MedEE single sign-on approach provides for streamlined user-friendly access to applications within the SmartPro MedEE enterprise.

Secure Access

Wipro manages the existing VPN appliances for IPSec VPN and SSL VPN clients. Wipro's Security Analysts will manage and monitor the VPN clients and access control. The critical activities include ongoing activity of management and monitoring of remote access by users, remote access

servers/devices to provide ease of access for remote and distant users, address Remote Access authentication / authorization problems, Receive and solve Remote Access client application-related and Remote Access device related Service Requests, etc.

Firewalls and DMZ for External Access And Remote Access

Without going into specific model and network configurations, Wipro has deployed and manages state of the art security and network segmentation for all types of enterprise environments/applications.

As part of the Security architecture design, Wipro creates 4 separate Data Security Zones. Each zone will be discrete and contain only applications with similar security restrictions.

Internet Access: This segment segregates the internet connection from rest of the State of Nebraska network.

External DMZ: This segment hosts the external facing servers such as Web servers, SMTP Gateways, VPN's and other publicly available web servers.

Internal DMZ: This segment hosts the internal servers of the State of Nebraska including Anti-Virus, etc.

Internal Network: This network segment provides network connectivity to the State of Nebraska users to access corporate applications. It includes users in remote offices, local server segments as well as corporate users.

Strong Authentication

Two-factor authentication is used to ensure maximum security to The State of Nebraska. On a regular basis, vulnerability and penetration testing will be performed on The State of Nebraska infrastructure to identify loopholes, if any. The following steps are followed to ensure multi-layer security:

Policy Based Access

All EES environments will be connected to The State of Nebraska through a custom network interconnects that will be established during the building of the EES infrastructures in the data centers. The firewall ensures policy-based access into the client network. It allows Wipro Nebraska employees to filter data based on application and IP addresses (source / destination).

Logging of Activity

Standard core router/Layer3 switch logs are always being generated via standard rules/policies. Issues deemed to fall outside of those rules/policy will send alerts to the monitoring servers and tools. Subsequent tickets and notifications will be sent to the support teams for research and resolution.

Intrusion Detection

Use of IDS sensors ensures that the security setup is not susceptible to a sustained attack by an outside presence or coordinated effort.

Separate VLANs: These would be created for segregating within the IT Infrastructure team from the servers that are deployed on-site. Appropriate access restrictions would be applied to ensure that only authorized Wipro/State users are allowed accessed. No 'citizen' connections will be connected via VPN, but rather will come across the Internet connections to the Cúram application.

Public key/private key encryption Secure Socket Layer (SSL) certificates;

Industry standard 256-bit encryption will be installed on all external facing VPN/non-internal interfaces and 128-bit certifications will be used on internal site and data structures. All connections will be secured via Cisco's "Secure VPN" application.

Admin Tools and Maintenance Routines

The Wipro data center uses the full complement of CA Unicenter management and monitoring tools. Wipro's strategic partnership with CA allows full utilization and supports the full suite of components. For network specific monitoring:

CA Nimsoft Monitor is built on a unified architecture that enables Wipro to monitor servers, networks, applications, databases, storage, private and public clouds as well as end user response time. This unified architecture allows for extremely efficient monitoring capabilities and is deployed across the Wipro data center environment.

Firewalls and DMZ for External Access and Remote Access

Without going into specific model and network configurations, Wipro has deployed and manages state of the art security and network segmentation for all types of enterprise environments/applications.

- v. Describe the approach to Solution Management that shall incorporate methodologies and practices which will assist the State of Nebraska to successfully manage the EES and shall address at least the following areas:
- a. Generate Administrative Alerts;
 - b. Updates to Distributed components;
 - c. SLR Monitoring;
 - d. Remote support;
 - e. Event Management and Monitoring using ITIL v3 or equivalent best practices; and
 - f. Application Performance Monitoring.

Generate Administrative Alerts

Wipro will use the full complement of CA Unicenter management and monitoring tools. Wipro's strategic partnership with CA allows full utilization and supports the full suite of components. Since Wipro also utilizes the CA Service Desk module across our enterprise, threshold monitoring, alerts and automated ticketing is seamless and fully integrated.

CA Nimsoft Monitor is built on a unified architecture that enables Wipro to monitor servers, networks, applications, databases, storage, private and public clouds as well as end user response time. This unified architecture allows for extremely efficient monitoring capabilities and is deployed across the Wipro data center environment.

Updates to Distributed Components

All updates to any component of the customer enterprise will be managed, communicated and agreed to by both Wipro Service Delivery systems and the State of Nebraska. Standardized current or current -1 revision practices are followed and documented.

SLR Monitoring

As referenced above, the CA Unicenter suite will supply the monitoring of all systems, based upon the unique configurations, required by the State or any other groups of the EES support organization requires.

Remote Support

Wipro achieves our optimized support model is accomplished via our distributed professional workforce. To ensure optimal physical security and extreme adherence to our physical security processes, Wipro utilizes its global associate base to provide industry leading systems support. In most cases support, even if the support organization is local to the data center, is done remotely, to allow for a fully optimized workforce.

Application Performance Monitoring

SmartPro MedEE uses IBM's PureSystems Manager (PSM), coupled with ITCAM for Applications, to monitor attributes ranging from low level technical information such as CPU utilization, through subsystem and application health, and up to application response time metrics. Using SNMP, these tools forward salient information upstream to the Enterprise Data Center monitoring tool.

14. Hosting and Disaster Recovery Services

The State of Nebraska has requirements for the Contractor to host the environments associated with the development phases of the EES project (DDI period), provide support services to long term development environments, provide application support services for production environment(s), as well as provide disaster recovery site and technical services.

Design Considerations

The Wipro/IBM team has taken the following into consideration when designing our solution:

- High availability leading to Tier 3 Data Centers/ Disaster Recovery in the U.S. and U.K. / Europe.
- Flexibility in scaling up/down depending on business requirements
- On demand based self-provisioning of servers, storage commodities to the State of Nebraska application team.
- Disaster Recovery based on application criticality and respective RTO/ RPO.

Based on the above parameters, the Wipro/IBM team has proposed the following environments to create a Data Center/ Disaster Recovery facilities.

- Create an environment in the Omaha Data Center for the Production Environment based on IBM's PureApplication Server
- An identical PureApplication Server hardware environment is duplicated in the Tempe Data Center

- Upon disaster, a Wipro administrator would log into Tempe and shut down the Production DRR Shadow Environment. The Production Environment would then be instantiated from the repository stored at the Tempe Data Center, Network addressing adjusted, and Production operations resumed, operating off of the shadow copy of the production database.
- Managed services will be provided for the PURE system as part of the hosting agreement.

Data Center/ Disaster Recovery Network and Security Architecture

The Wipro/IBM team will have uniform Data Center and Disaster Recovery Network and Security architecture for the Pure System Data Center and Disaster Recovery sites for the State of Nebraska. The layered architecture segregating the State of Nebraska DMZ and any other compliance related servers/storage such as PCI systems, including Cisco LAN devices is illustrated in Figure IV-182 below.

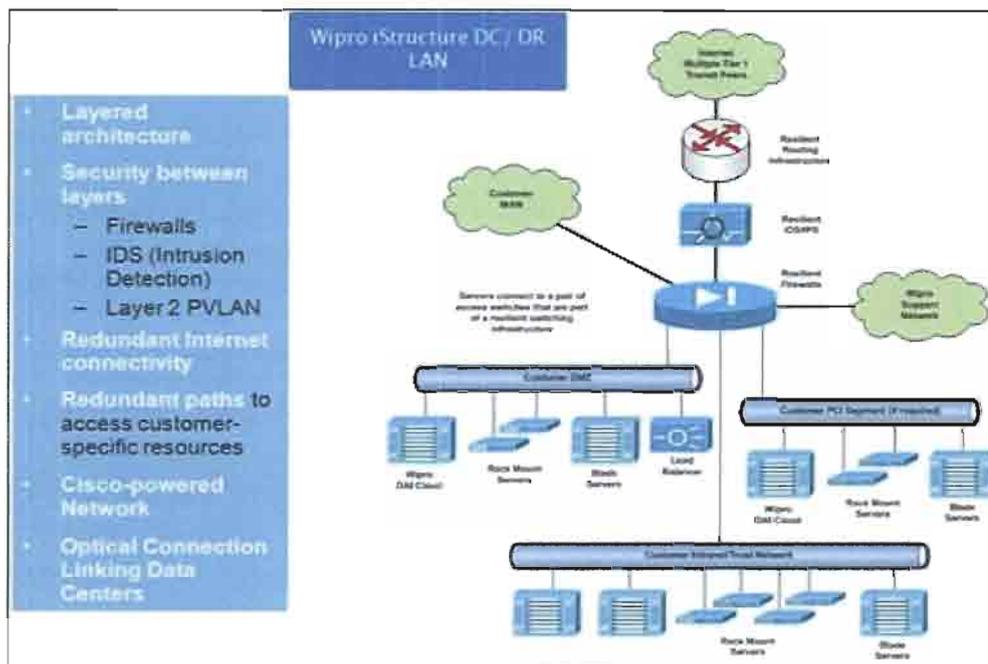

Figure IV-182: DR Architecture

As part of the Security architecture design, Wipro will create 4 separate Data Security Zones. Each zone will be discrete and contain only applications with similar security restrictions.

1. **Internet Access:** This segment segregates the internet connection from rest of the State of Nebraska's network.
2. **External DMZ:** This segment hosts the external facing servers such as Web servers, SMTP Gateways, VPNs and other publicly available web servers.
3. **Internal DMZ:** This segment hosts the internal servers of the State of Nebraska's including Anti-Virus, etc.

4. **Internal Network:** This network segment provides network connectivity to the State of Nebraska users to access corporate applications. It includes users in remote offices, local server segments as well as corporate users.

15. Development Environments

The Bidder must propose, provide and operate all required environments to support its proposal for the specification, design, development and implementation of the system including, but not limited to the following environments:

- a. Sandbox;
- b. Configuration/Development;
- c. Test;
- d. Quality Assurance;
- e. Production
- f. Training; and
- g. Disaster Recovery

These environments should be sized in accordance with planned use and be inclusive of all hardware, storage, networking, backup/restore, database, file system, monitors and other items as required to comprehensively support the development effort.

Background

The Wipro/IBM team has mapped the State's Development Environments into the set of Environments described in Table IV-57 below. Please note our answer to the Disaster Recovery Environment is included in our response to Section "Disaster Recovery Environments found below. However, this section does discuss our approach for the management of Disaster Recovery for the Development Environments detailed in this section.

We are proposing implementation of all **SmartPro MedEE** Environments, Development, Production, and DRR, on two identical IBM PureApplication 1700-64E Servers. These servers include all computing resources and storage required to operate **SmartPro MedEE**: only the Network Fabric, Data Center Enterprise Monitoring and Management tools, and Tape Backup are outside of these two boxes. The two servers are dedicated to the State's EES; the Network Fabric, Data Center Management, and Tape Backup are shared services within the Data Center.

Each server consists of 2 compute nodes with an aggregate of 64 Power7+ processor cores, a total of 1 TB of RAM, and approximate 50 TB of integrated disk storage, combining a mix of Solid State and classical Magnetic Disk storage. These servers are highly resilient, with no single point of failure, redundant power, network interfaces, busses, and RAID storage.

The two servers are designated Primary and Secondary, reflecting their respective roles relative to the main Production Environment. The Primary Server sits in Wipro's Primary Data Center located in Omaha Nebraska, and services the normally operating Production Environment, and several of the Non-Production Environments at the same time. The Environments are isolated from each other using Virtual Machine (VM) technology, where an Environment consists of one or more dedicated VM configurations and related data stores, configured to meet performance, security, and availability goals unique to each Environment.

The Secondary Server is located in Wipro’s Secondary Data Center in Tempe Arizona. In normal operation, the Secondary Server receives near real-time database updates to a specialized small Recovery (Production) Environment, which keeps a shadow copy of the production database in near currency with the real production database housed back the at the Primary Site. This consumes a small amount of the overall Secondary Server resources. The rest of the Secondary Server resources are dedicated to most of the Development Environments. While maintaining full performance capacity for the Production Workload without compromise, each server is capable of running all Environments simultaneously if needed, though with reduced capacity allocated to the non-Production Environments. The one exception is that both Production and QA (Large), the full sized load, stress, and performance test environment that mirrors Production, cannot co-exist on the same single server with introducing at least a possibility of performance interference between the two.

This balanced Workload makes all hardware useful at all times, with nothing specifically dedicated to Disaster Recovery. The use of VM technology allows the physical resources to be moved around as required to meet performance targets – an operation that is mostly automated, dynamic, and real-time in the PureApplication Server Environment.

Development Environments

We have mapped the State’s requirements to the following set of Development Environments. Table IV-57 documents the list of Environments, and describes their general purpose.

Table IV-57: Development Environments

Environment	Description/Purpose	Default Server
Development	Supports multiple instances of configuration and development. Near full functionality is available, though often not used. Limited performance capacity, limited and sanitized data. Provides controlled updates into System Test.	Secondary
System Test	System Test brings together one or more application components for formalized testing by QA. Near full functionality is available, though often not used. Limited performance capacity, limited and sanitized data. Receives controlled updates from Development, provides controlled updates to Integration Test.	Primary
Integration Test	Integration Test brings together most/all application components, including “outside” interfaces for formalized testing by QA. Full functionality is available, and often used. Limited performance capacity, limited and sanitized data. Receives controlled updates from System Test, provides controlled updates to QA (Small and Large.)	Primary
QA (Small)	Aka User Acceptance (UAT). QA (Small) is used for most final acceptance testing, when full load / stress testing is not indicated. Full functionality, limited performance capacity, database can be full or limited as required. Receives controlled updates from Integration Test, provides controlled updates to Staging and Production. Only one of QA (Small) and QA (Large) are running at one time.	Secondary

Environment	Description/Purpose	Default Server
QA (Large)	Aka User Acceptance (UAT – Load/Stress). QA (Large) is used for final acceptance testing, when full load / stress testing is indicated. Full functionality, full performance capacity, full database. Receives controlled updates from Integration Test, provides controlled updates to Staging and Production. Only one of QA (Large) and QA (Small) are running at one time.	Secondary
Sandbox	Sandbox is a specialized environment dedicated to State personnel for controlled experimentation and testing of limited changes to an existing or proposed environment – especially non-code-based changes such as rules, configuration, and Business Intelligence. Near full functionality (lacks outside interfaces), limited performance capacity, database limited or full as required. Can be rapidly refreshed to a known state. Normal refreshed state is Production functionality. Controlled updates mirror Production.	Secondary
Training	Training is a specialized environment dedicated to training staff, especially in the context of formalized instructor-led training. Near full functionality (lacks outside interfaces), limited performance capacity, limited and sanitized database. Functionality and data can be rapidly refreshed to a known state. Normal refreshed state is Production functionality, but can be imaged from QA (Small or Large) to train to a forthcoming release. Controlled updates mirror Production or QA (Small or Large.)	Secondary
PMO	A specialized environment used to host tools used by the Program Management Office and the SDLC. For example, Requirements Management and Test Management. No connection with Production functionality, limited performance capacity, limited and specialized database.	Secondary
Staging	A small “code” environment used to stage updates into Production, after signoff and approval for implementation by the State. Staging receives its code from QA, either large or small depending upon the change, and drives the configuration into Production.	Primary

Each of these Development Environments is configured as a PureApplication Server Workload, comprising one or more Virtual Machines. The allocation of VMs is designed to reflect the performance, security, and high-availability requirements specific to each task. Generally, these environments are relatively small, with compressed tiering e.g. Web Server and Application Server placed in the same tier and VM, and do not use clustering or load balancing, either for performance or high availability. At the other extreme, the QA (Large) environment is a complete duplication of Production, with a replication of the complete tiering, clustering, and performance characteristics of Production.

Contingency/DRR for Development

Several assumptions are built into our design covering contingencies for the Development Environments:

- While RTO for Development Environments is not as aggressive as for Production, it should be possible to recover any / all Development Environments to their alternate sites, if needed. While reinstating Production is the first focus in Disaster Recovery, once

instantiated, development activities may still be required or desired while in contingency mode.

- Loss of the Secondary Center, which hosts many of the Development Environments, is as much of a DRR scenario as loss of the Primary Center. It must be possible to restore most of the Development activities into the Primary Site.
- It is acceptable to compromise the performance of non-Production Environments when running under a Disaster Recovery scenario, but Production performance cannot be compromised.
- Non-Production recovery does not require the low RPO/RTO targets of Production – it is acceptable to synch to “yesterday’s” database.

To support these assumptions, we propose using PureApplication’s VM shipping capability to copy an Environment and its configuration from one server to the other. Once past Development, the other Environments are under Change/Configuration Management, which will automatically include synchronizing the Environment to its backup location.

As a fully virtualized implementation, including the compute, memory, network, and storage resources, physical resources are assigned commensurate with each Environment’s requirements. PureApplication Server allows resource assignments to be changed “on the fly”, and is configured to automatically tune an Environment within defined limits, based on resource utilization and performance targets. Beyond PureApplication Server’s configured self-tuning, staff can intervene to make resource allocation changes nearly instantly in response to unforeseen contingencies, resulting in a highly flexible and cost-effective hosting environment.

16. Production Environment

The State of Nebraska may choose to use the services of the Contractor for the EES and EES Platform Production hosting. In advance of use, and in consideration of the State of Nebraska procurement, installation and commissioning cycles, the Bidder will specify all required environments to support their proposal for the ongoing specification, design, development of the project associated with subsequent cycles including, but not limited to the following environments:

- a. Full Production Operation;
- b. Production Replica for Fault Resiliency/Onsite Disaster Recovery Purposes and debugging/issue resolution purposes;
- c. Offsite Disaster Recovery Replication; and
- d. Other environments deemed necessary by the Contractor to support production operations.

These environments should be sized in accordance with planned use and be inclusive of all hardware, storage, networking, backup/restore, database, file system, monitors and other items as required to comprehensively support the ongoing development operation of the EES as well as to support the debugging or resolution of issues within the production environment.

Production Environments

We have mapped the State’s requirements to the following set of Production Environments. Table IV-58 documents these Environments, and describes their general purpose.

Table IV-58: Production Environments

Environment	Description / Purpose	Default Server
Production	The primary Production environment, running in normal, non-DRR mode out of the Primary Data Center. Full functionality, full performance capacity, full live data. Sends database updates to Production DRR Shadow in near real-time. Always runs alongside Production DRR Shadow, never with Disaster Recovery. Content derived from QA (Small or Large) and/or Staging.	Primary
Production DRR Shadow	A limited, database-only environment running in the Secondary Data Center that receives all database updates from Production in near real-time. Is running only during normal, non-DRR mode. No functionality, limited performance capacity, full live data. Always runs alongside Production, never with Disaster recovery. Content derived from QA (Small or Large) and/or Staging	Secondary
Data Conversion	Data Conversion is a highly specialized production environment optimized to running large data conversion jobs, in preparation for major implementations or upgrades. Limited functionality, limited performance capacity, full live database. Code base promoted from QA (Small or Large.)	Primary

As with the Development and Disaster Recovery Environments, these Environments are comprised of unified collections of Virtual Machines, defined to meet performance, security, and availability requirements. Each Environment’s VMs are then resourced with appropriate physical resources, such as compute cores, memory, and storage. However, there is no specific identifiable hardware that is dedicated solely to any of these environments. Each Environment is capable of executing as a virtualized workload on either one of the two *SmartPro MedEE* IBM PureApplication Servers.

The Production DRR Shadow environment serves a unique function, different in kind from all the other Environments. When running in normal, Non-Disaster Recovery mode, the Production Environment running in the Primary Center ships its database log files to the Production DRR Shadow environment running in the Secondary Center. The Shadow Environment applies these log updates in near real-time to its copy of the production database, which provides a nearly synchronized database resident in the Secondary Center at all times. If it becomes necessary to invoke Disaster Recovery due to a loss of the Primary Center, the Shadow Environment is shut down, and the dormant Disaster Recovery environment is instantiated, pointing at the shadow database. Network addressing is updated, and the Disaster Recovery environment is now functional. As there is only one operational site when operating in Disaster Recovery mode, there is no Shadow environment instantiated until operations returns to the normal, two site mode.

17. Disaster Recovery Environments

The State of Nebraska may choose to use the services of the Contractor for the EES and the EES Platform Disaster Recovery site hosting. The Bidder must specify all required environments to support their proposal for the ongoing operation of the production system in the event of a disaster or outage condition at the selected computing center(s) associated with the following environments:

- a. Full Production Operation;

- b. Systems Development inclusive of then current code bases and associated data associated with the development effort; and
- c. Other environments deemed necessary by the Bidder to support production operations in the event of an outage or disaster.

These environments should be sized in accordance with planned use and be inclusive of all hardware, storage, networking, backup/restore, database, file system, monitors and other items as required to support limited development effort during the disaster or outage condition as well as to not adversely impact or jeopardize phases that are being developed.

Bidders must detail the proposed approach to system hosting and disaster recovery support services, including the type and levels of services offered and the process for requesting changes to the services. In addition, provide a summary of the Bidder's strategy for ensuring stable and uninterrupted operations. Specifically, describe any industry best practices employed (e.g. ITIL) or certifications achieved (e.g. ISO 20000) that would provide assurances that the Bidder shall be able to provide a consistent and high quality level of services.

The term for providing these environments shall commence upon execution of an agreement between the State of Nebraska and Contractor, and shall conclude upon the end of the term for this contract or upon notification from the State of Nebraska of the desire to host the system(s) elsewhere. During the term of this contract the off-site hardware used by the Contractor to provide the hosting service is and will remain the property of the contractor. The State of Nebraska will pay the Contractor an agreed upon fee for the use of the hosted environments.

Upon notification by the State of Nebraska of the availability or receipt of the hardware to support these environments in the State of Nebraska data center or an alternate data center, the Contractor shall install, configure and commission for ongoing use these environments within the State of Nebraska data center or alternate data center, if required.

Upon completion of this migration and direction from the State of Nebraska, the old non-production environment should be decommissioned by the Contractor, any Contractor hardware usage charges arising from the use of this equipment shall no longer be the responsibility of, nor billed to the State of Nebraska, and all State data or other artifacts resident on this hardware shall be destroyed or otherwise deleted.

Business Continuity Plan

The Wipro/IBM team has designed a business interruption contingency plan to ensure the survival of the business in the worst possible scenario. The plan has three principal components:

PREVENTION: Wipro Data Centers are based on fault tolerant engineering to provide non-stop operations. In addition to these design preventive measures, Data Center sites are located away from industrial areas, airports, railways, and interstate highways. Most site locations have no documented earthquake or tornado activity.

CONTINUANCE OF SERVICE: Wipro will assist the State of Nebraska in the event of a disaster at a Wipro Data Center. Specific recovery services provided by Wipro include (but are not limited to):

1. Upon disaster, a Wipro administrator would log into Tempe and shut down the Production DRR Shadow Environment. The Production Environment would then be instantiated from the repository stored at the Tempe Data Center, Network addressing adjusted, and Production operations resumed, operating off of the shadow copy of the production database.
2. Management and coordination of recovery operations
3. Provision of appropriate technical resources during the recovery process

RESTORATION OF COMPANY OPERATIONS: A warm-site agreement would serve as Wipro's base of operations until restoration of all services has been completed at a new/different facility. The warm-site will include all environmental equipment necessary to support computer operations, including power distribution centers, HVAC units, chillers, water detectors, fire detection/suppression systems, card key access systems, UPS, and diesel generators.

Wipro will maintain on-line, dedicated redundant equipment at a geographically dispersed Data Center in Tempe Arizona.

1. Production Data will be replicated to the Disaster Recovery site.
2. Wipro will develop and maintain a plan and processes for switching processing to and from primary equipment to redundant equipment in support of meeting the RTO and RPO.
3. Planned testing will be executed once per contract year to exercise the disaster recovery plan.
4. Wipro will schedule the test during a specified test window. Observations, conclusions and recommendations resulting from the test will be documented and discussed with the State of Nebraska management.
5. Fall back testing can be included in the scope as an option as identified in the Work Order.
6. Costs associated with disaster declaration are the responsibility of Wipro unless the declaration is unilaterally declared by the State of Nebraska
7. Wipro will be given 120 days after the Migration Date to prepare for the first disaster recovery test.
8. Wipro reserves the right to move the disaster recovery center to a different location.

xiii. Turnover

The Bidder must describe its proposed methodology for turning the system and full operations over to the State of Nebraska or a successor contractor. The methodology should describe the Contractor's approach and plan for turnover.

Our approach, methodology and process for turnover and transition of the *SmartPro MedEE* is built on our accumulated knowledge, lessons learned, and experience-honed practices transitioning systems and operations for many clients. Our methodology is an organized and disciplined approach using Microsoft Project as the tool to maintain the schedule, activities, task and milestones aligned with the necessary resources for a successful transition. The transition will use the work plan as a living tool to meet the established benchmarks and to monitor the completion of every key task. We will align our project schedule and milestones to the project management life cycle phases as follows:

- **Phase I:** Transition Initiation
- **Phase II:** Transition Planning
- **Phase III:** Transition Installation, Configuration, Migration and Unit Testing
- **Phase IV:** Transition Integration Testing
- **Phase V:** Transition Training

- **Phase VI:** Transition Parallel Testing
- **Phase VII:** Transition Operational Readiness
- **Phase VIII:** Transition Go-Live
- **Phase IX:** Transition Close

When implemented, this approach will eliminate or mitigate transition issues and support pro-active management of potential issues.

Turnover Approach

- a. Describe the approach to system and operations turnover based on the Contractor's proposed solution and the Contractor's own experience with comparable MLTC projects;

To give the State the clearest view of our proposed approach, this discussion addresses our approach through separate activity streams, rather than a linear process. We begin with the Turnover Plan itself.

Turnover Plan Life Cycle

A Draft Turnover Plan will be part of the contract deliverables submitted to the State for review and approval as part of the initial set of *SmartPro MedEE* documentation. The primary purpose of this deliverable is to obtain State approval of the plan structure and intended content. During the contract period, the State may request additional updates to the Draft Takeover Plan, at appropriate junctures, for example, if the EES expands beyond the Medicaid population.

Even with the State's approval, this plan will remain a "draft" until the State selects a contractor to operate and maintain the EES. Each plan revision makes the content more robust and closer to a formal plan that can be put into operation.

A major revision to the Turnover Plan will be required when the State sends a written notice of their intent to take over the EES or procure a new EES contractor. In the latter case, potential bidders will need current turnover information such as:

- Proposed approach to Turnover
- Turnover work plan, including detailed tasks and subtasks
- Turnover schedule
- Procedures to maintain up-to-date documentation during Turnover

The Wipro/IBM team will have 30 days (from receipt of the State's request) to respond to this request.

At approximately the same time, the State plans to send a separate yet related written request for additional information to support of the State's development of the new RFP. This request also has a 30-day turnaround. The request is expected to include contract performance reports; inventories of hardware/software, technical frameworks and/or schematics, including EES interfaces; and other requested EES contract or operational/ maintenance information.

The Turnover Manager is engaged at this point. One of the Turnover Manager's responsibilities is to oversee completion and submission of responses to all State requests involving Turnover.

After the State selects a contractor to operate and maintain the EES, the State will request one of the following:

- A revised Turnover Plan from the Wipro/IBM team based on the actual turnover scenario
- A Transition Plan from the company or agency accepting what we turn over. Additional plan revisions may be required throughout turnover.

Task/Activity Negotiations

State approval of the formal Turnover Plan signals readiness for a series of meetings between the Turnover Manager and team, the incoming contractor's team. These meetings will be included on the Turnover Schedule. The State may participate in all, some or none of these meetings. The purpose of these meetings is to settle on basic aspects such as:

- Review and (if necessary) revise tasks and activities to be performed
- Clarify time to completion for tasks and activities
- Establish precedents and predecessor/successor relationships
- Confirm training needs (level of training, staff to be trained, schedules, and other practical and logistical consideration)

The Wipro/IBM team will seek the State's approval if any of these discussions in any of these meetings result in recommended changes to the Turnover Plan or Turnover Schedule.

Aligning our Turnover Plan and with the incoming or state transition plan is a key element of the Wipro/IBM team's commitment to work with the Department and any successor contractor to establish and maintain an effective and executable plan, and to reconcile turnover planning to the greatest possible extent.

Data Transition

A primary source of data resides in the data warehouse files. Our proposal is priced so the data warehouse server will be turned over to the State.

Under this approach, we will turn over our back-up server and cease sending transaction updates until the back-up server environment is established in a new location or in the state data center. We will restore the configuration of the primary server in the secondary server and start sending real-time log updates to it.

At this point, our Primary is still Production, and the State's new secondary server represents the DRR fallback. To complete turnover we will

- Institute DRR failover, making the State's Secondary Server the operational box
- Move our old Primary to their Primary center, and bring it back online using the recovery scenario for returning operations to normal.

Archived files will be conveyed according to the contract terms.

Real-time Function

The synchronization model for the Production Environment uses DB2's native log shipping facility. The Primary Production DB2 is in communication with a shadow copy running in the Secondary center. This shadow receives updates at the DB level, in near real-time, and applies them to its copy of the database.

Post-Turnover Support

Post turnover and for a defined period, our support close out process is mutually agreed. At the option of the Department, we will position to continue support and operations of *SmartPro MedEE* should the successor contractor fail to satisfactorily implement or perform as required.

Turnover Training

- b. Describe the approach for training State of Nebraska staff, State contractor staff or the successor contractor;

Turnover training is planned as a key element in the approved transition plan. The approach includes defining all training activities, curriculum, methods, processes and schedules in a detailed turnover plan. Training activities include identifying staff (state and/or contractor) to be trained, developing training content plans, defining the schedule, location, and duration of sessions. These plans will cover all necessary topics, operating and desk level procedures along with updated and current desk level and documentation supporting *SmartPro MedEE* operations, trouble shooting, call management, network monitoring and security.

Managing Transition while Maintaining Production

- c. Describe how the Contractor will manage the transition while maintaining production schedules;
1. Provide for an orderly, complete, and controlled transition to the State of Nebraska or successor contractor(s);
 2. Avoid disruptions of processing and services provided to members, providers, and operational users of the MLTC during the turnover period;
 3. Maintain MLTC responsibility through the effective date of the transfer of responsibility and through the completion of the reconciliation of final day processing conducted by the Contractor, including data and report output; and
 4. Provide technical and operational services and information as needed to facilitate an informed, coordinated, and complete transfer of activity.

For the State, one critical aspect of Turnover is a non-disruptive transition of *SmartPro MedEE* functionality from the Wipro/IBM team to the State or a subsequent State contractor for hosting and operation. Our chief mitigation tactic is to closely integrate Turnover and Operations wherever possible, so Turnover actions become almost organic.

A carefully planned production cut-over process and schedule will be defined and negotiated with the State or contractor to assure production schedules are maintained throughout the transition. Close coordination during the transition will be maintained through status check point sessions to

review the schedule, verify each party has executed the defined action steps agreed to. The simplest way to implement this approach is to acclimatize staff to the turnover approach and plan well in advance of the kick-off of activities and task. Critical task will be defined, along with administrative task supporting the transition steps.

We plan to adopt the same standards and procedures applied to the *SmartPro MedEE* project operation for:

- Communications Management
- Issue Management
- Risk Management
- Progress Tracking and Schedule Re-forecasting
- Status Reporting

State staff will not be spending un-productive time in determining how to access Turnover Status Reporting, where to find out whether a potential Turnover risk is already on the Turnover team's radar, or who to call about Turnover hosting activities. Turnover activities, reports, task and status will be uniquely identifiable and appropriately grouped for fast identification.

During turnover execution, the Turnover Plan may continue to be refined to reflect an improved mutual understanding between the Wipro/IBM team, the Department, and any contractor successor. Updating and re-planning to accommodate events as they develop during turnover is crucial. The Takeover Manager will be responsible for plan currency and state approval request. Changes to the approved plan will still follow the Change Management methodology processes and procedures proposed by the Wipro/IBM team and approved by the State.

Turnover Staff

d. Describe the staff responsible for transition; and

A dedicated Turnover Manager will be responsible for all activities associated with the turnover of *SmartPro MedEE* to the State of Nebraska or successor contractor(s). Support will be required from

- Datacenter Staff, including network, operations, infrastructure and application staff for guidance on transitioning applications and data to the new environment.
- Training Staff to prepare State and any contractor staff to take over and operate the *SmartPro MedEE* solution successfully.
- Administrative Staff to support operating environment license transfer procedures, if appropriate and included in the transition plan.
- Contract/Financial Staff to process the contract to completion and ascertain that all financial obligations are settled.

Statement of Commitment

e. Include a statement that the Contractor is committed to working with the State of Nebraska and successor contractor(s) in planning and performing the Turnover activities.

The State has the Wipro/IBM team’s commitment to follow the proactive and progressive approach we believe is required, both in letter and spirit, to achieve a controlled, well organized and executed, transition of both functional and non-functional aspects of the *SmartPro MedEE*. Each party involved with the transition equally contributes to the effort’s success. Our team will work from a professional and proactive posture through all phases of the Turnover plan.

During Turnover planning and execution, we will actively work with the State and its successor contractor, as appropriate, to achieve mutually acceptable work schedules, identify and manage risk and execution of effective training for the transition. The same will hold true for setting times for training and/or knowledge transfer activities. Preserving the integrity of the ongoing Maintenance and Operations functions until contract end is just as important as turning on the new *SmartPro MedEE* with no bumps in the road.

The State should receive more from the outgoing contractor than the minimum effort that satisfies contractual requirements. Fulfilling turnover and transition obligations completely and accurately, with no breaks in accurate service and timely support are owed as well to the end users. As the nation watched the federal healthcare online eligibility and enrollment operation opened for business only to face such spectacular failure, the chagrin of the general public, the press, and the politicians was palpable. We value all our clients and know that our reputation is built on client trust in our service.

xiv. Service Level Requirements

The Wipro/IBM team has a robust Service Level Management (SLM) approach for managing service levels to ensure services are delivered on time and with quality. Service Level Agreements (SLAs) will be managed through the SLM process, with specific targets for applications in scope. We propose the following key principles for service level management:

- Establish the SLA baseline
- Implement SLA
- Manage the On Going Change
- Periodic Reviews

Establish SLA Baseline

This step comprises of planning and setting up SLM processes for in scope. During the planning phase, the Wipro/IBM team will analyse and establish the current performance for the various service level parameters which will form the baseline. The Wipro/IBM team will work with State of Nebraska to understand the customer expectations to derive the SLAs. The business critical factors of the engagement will be assessed by the Wipro/IBM team in coordination with the State of Nebraska and appropriate criticality / service levels will be defined for each SLA. Typical recommended critical / service levels are:

Table IV-59: Criticality or Severity Levels

Criticality or Severity levels	Definitions of criticality / service level
--------------------------------	--

Critical/Severity 1	The EES no longer functions at all, or a System component is unavailable to more than 20% of active production users.
High/Severity 2	Any defect that affects less than 20% of the EES functionality or less than 20% of active production users.
Medium/Severity 3	The EES is able to function with a temporary workaround.

All the services rendered to the client as part of the contract will be categorised into a service catalogue and appropriate Key Performance Indicators(KPI) will be defined. The SLA Report Templates and associated frequency of reporting will be defined based on discussions with the customer.

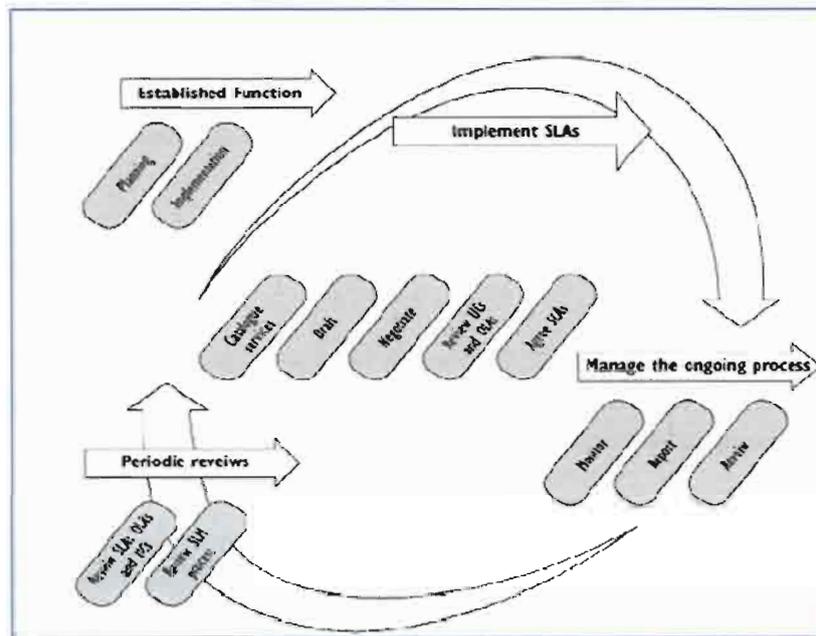

Figure IV-183: SLM Methodology

Implement SLAs: This step comprises of measuring and reporting on SLAs as well as creating, formulating and setting up SLAs where the baselines do not exist. The Wipro/IBM team will define the measurement criteria for the SLA parameters, measure and track the SLA for three months which will form the baseline for subsequent adherence. The necessary threshold levels for RAG status (Red, Amber, and Green) will be defined for the SLAs wherever possible. This will help in the reporting process to quantify the number of SLAs through RAG status driving possible improvement actions.

Manage the On-going Change: This step provides methodology to monitor report and review SLAs. The Wipro/IBM team will review the key SLA metrics as proposed by State of Nebraska and additional metrics like Trend analysis, Top repeatable call cases, Knowledge base contributions and Helpdesk integration metrics.

Periodic Review: This step involves periodic review of SLA process as well as SLAs vis-à-vis any changes in the service delivery. The Wipro/IBM team will conduct periodic review of the SLA process and the SLAs with a view to improve the customer satisfaction by continuously improving

the quality and speed of delivery. If there are any changes identified during the periodic review for the SLA or KPI, the Wipro/IBM team will raise an amendment request to formalise the change.

The Wipro/IBM team proposes to bring quantitative service measure to delivery through Service Level Agreements. We will discuss and mutually agree set of KPI's that would ensure the best outcome from the Wipro/IBM team engagement during the implementation engagement. To meet State of Nebraska's objectives, Wipro will use the following design principles to enhance the effectiveness and drive efficiencies and help transform the future.

- Effective performance measurement through defined norms /benchmarks and governance framework
- Holistic view of metrics and governance control

The Wipro/IBM team must receive prompt (within 5 business days) responses to its questions from State of Nebraska in order to provide the Services within timeframes and costs. All delays will be subject to impact analysis and possible change control.

SLAs will be agreed between both the parties during due diligence / initial meetings. The SLA will be applicable post baseline period. During baseline period, the Wipro/IBM team will gather the data related to the proposed SLAs.

The below table refers to the list of possible SLAs that can be used to as a reference and manage the engagement effectively. The Wipro/IBM team will work with the customer to customize and further refine the SLAs as per the needs of the engagement.

Table IV-60: Possible SLAs

Category	SLA	Definition
PMO	Key resource availability	Positions that are designated as Key Staff shall not remain vacant for more than thirty (X) calendar days.
PMO	On time delivery	Unless otherwise specified, milestones and deliverables for each phase must be completed by the Contractor in final form on the dates specified in the Contractor's work plan
PMO	Corrective Action plan	Define a corrective action plan within X days from the time a performance deficiency is identified
PMO	Publish meeting minutes	Deliver meeting minutes for the status meetings within X business days following the meeting.
PMO	Deficiency resolution time	if the work product is not acceptable due to deficiencies, The Contractor must resolve all deficiencies or present a written plan for resolving the deficiencies and submit it to the State within X business days after receipt of the State notification.
Security	PHI security breach communication	Notify the State agency by no later than X calendar days after the Contractor becomes aware of the disclosure of the Protected Health Information.
Security	Security plan review	The Fiscal Agent shall certify, on an annual basis, perform a review and update of the Security Program for

		continued compliance
Security	Disaster Recovery	The business site must be fully operational within the threshold hours as indicated in the disaster recovery plan from the time the primary business becoming unsafe or inoperable.
Security	HIPAA Compliance adherence	The Contractor must ensure it meets all federal regulations regarding standards for privacy, security, and individually identifiable health information as identified in the Health Insurance Portability and Accountability Act (HIPAA) of 1996.
Systems	Response time – Severity 1	The elapsed time between the end of an inquiry or demand on the system and the beginning of a response will not be more than 4 hours
Systems	Response time – Severity 2	The elapsed time between the end of an inquiry or demand on the system and the beginning of a response will not be more than 8 hours
Systems	Response time – Severity 3	The elapsed time between the end of an inquiry or demand on the system and the beginning of a response will not be more than 72 hours

xv. Deliverable Approval Process

The Wipro/IBM team acknowledges and will adhere to the Deliverable approval process as stated within the RFP.

xvi. Value Add Options

The Bidder may also submit Value Added Options that have not been requested in this RFP, but are based on a Bidder's market knowledge and experience. The Value Added Options will not be evaluated to determine the EES Contractor; however the State of Nebraska may determine to contract for an option after the Contractor selection has been made. Bidders must include a cost for each Value Added Option in their Cost proposal.

- a. Describe each Value Added Option. The description should include:
 - I. How the Value Added Option could enhance the EES;
 - II. How the State of Nebraska could benefit from the Value Added Option;
 - III. How the Medicaid eligibility effort could benefit from the Value Added Option; and
 - IV. Where and when the recommended Value Added Option(s) has been implemented.
- b. Describe the EES' current mobility (e.g. smartphone, tablet, etc.) capabilities and/or plans for mobility in upcoming version(s).

The Wipro/IBM team proposes the Diona Government Enterprise Mobility (GEM) Solution as a value ad option for the Nebraska MLTC. Diona applies “mobile-first” principles to provide anytime/anywhere access to social services information and eligibility by providing a new system of engagement (SOE) that integrates with existing systems of records (SOR). As a health and human services specific mobile solution, Diona GEM employs an innovative, vertical specific, mobile user experience (UX) paradigm that enhances usability and meets citizen and agency employee

expectations of modern engagement with government. Díona GEM is designed to leverage mobile technology elements such as wireless access, GPS navigation, on-device camera, and scanners, bringing productivity gains for agency staff and enabling more self-service options for citizens and service providers.

Díona GEM utilizes open and industry technology standards to communicate with existing backend systems. These web-based connectors (using SOAP requests and responses over HTTPS) allow for communication to and from the backend system of record to Díona GEM Solution data store and application. This process allows for communication with existing health and human service backend systems and focuses efforts on the configuration rather than the development of the mobile application.

Díona GEM provides domain specific mobile solutions to global social security, social services and health and human service agencies, utilizing subject matter experts in both the health and human services field as well as the user experience arena. Through the continued development of their innovative and configurable mobile solution (Díona GEM) for the global social services market, their solution can provide a mobile application suite that will leverage mobile environment specific use cases for Medicaid field workers.

Remote Access requires an end-user device, a transport network, and hardware and software within the enterprise to allow the establishment and use of applications and data by remote users. Mobile and Remote Access services will be used most often to support “nomadic” users – those who travel from location to location, and to support “telecommuters” – users who access enterprise resources from their home.

The recommendation is to provide a new System of Engagement that will allow Nebraskans to apply for and manage their Medicaid account. This feature would provide a means by which citizens can manage their account details online by using the first health and human services focused mobile application.

Studies have shown that if leveraging and utilization of mobile tools by government organizations were to double (from approximately 35% to 70%), the additional value to governments in efficiency outputs could increase by nearly \$50 billion annually. Coupled with that is research that has found that smart phone consumption is increasing by up to 10% every year, and with an increasing number of users leveraging those phones as their primary source of internet access. According to Steven VanRoekel, the Chief Information Officer (CIO) of the United States, *“for too long, the government has employed 20th century tools to solve 21st century problems. We fell behind in making the smart investments in technology that yield productivity gains in the private sector every day.”* As more and more government agencies move towards 21st century tools for 21st century problems, the need for a framework that understands the unique needs and business processes associated with the health and human services market is becoming greater, and the Díona Government Enterprise Mobility (GEM) Solution is the first framework in human services that leverages a new system of engagement – mobile.

The proposed “value add” solution is to introduce a mobile application geared to the citizenry of Nebraska. A citizen centric solution will allow for the simplified capture of relevant application data for Medicaid, provide the ability to conduct a “pre-screening” of potential eligibility, as well as provide on-going account management activities.

The “pre-screening” process could be a simplified process by which a user/citizen will be able to quickly determine their potential eligibility for Medicaid via a connected system of engagement (e.g. smart TV, kiosk, tablet, etc.). Based on a minimal set of information (e.g. citizenship and financial status), the citizen would be able to quickly ascertain whether or not it makes sense to continue with the process. If appropriate, the Díona GEM application could capture more detailed information, pass that information along to the new eligibility determination engine. This information will be assessed in real time and return the eligibility status to the citizen immediately upon submission of their application.

The citizen’s online account would also provide the client access to requests for further evidence (e.g. requests for annual resubmittal of evidence) by notifying the client of verification requests, allowing the client to snap and send photos as part of the verification process and status on request for information by the organization. The online account would provide continued long-term interface options between the citizen and the agency to help manage future programs, notifications in changes of policy or eligibility, etc.

- Introducing a self-service component would increase patient management efficiencies by:
- automating the data entry process of application details,
- automating the eligibility determination process,
- increasing worker availability to work on more difficult “high-touch” cases while reducing the amount of time spent on “no” or “low-touch” cases and
- increasing client satisfaction by streamlining existing manual processes to reduce time for response.

With the introduction of the **Díona GEM’s** Online Account management feature, there is the potential to reduce lapse in eligibility by automating the requests for verifications and providing real-time access to status details directly to the clients regarding submissions and eligibility.

Díona Technologies is a global technology company with particular expertise with the Cúram application and insight into leveraging Cúram through integration of additional enterprise solution components adapted for a particular client through configuration.

We are excited to offer this particular component and look forward to an opportunity to calculate a return on investment (ROI) for MLTC. Please see the cost proposal for assumptions and costs estimates.

C. TECHNICAL CONSIDERATIONS

Technical Considerations – a Business Owner’s Perspective

IBM Cúram is positioned in the U.S. Public Social Service space as a leader in the commercial off the shelf (COTS) market space because of its integrated approach to managing all social service programs using a single platform approach. Other alternatives typically take a multi-application, multi-module approach to handling fundamental case management capabilities. Most assets need to be built around a core framework. For IBM Cúram, the framework, including the presentation layer is fully built. The majority of the work required is configuring rules to meet the State’s needs as well as building out project specific reports and custom interfaces to third party systems. The time required to automate business processes is reduced significantly because of the IBM Cúram pre-built functionality.

Cúram: is unique in that the framework is tailored to your business Out-of-the-Box (OOTB). The preconfiguration also saves a significant amount of time.

Why Cúram COTS product is right for Nebraska

In the United States, Commercial Off-The-Shelf (COTS) is a Federal Acquisition Regulation (FAR) term for goods available in the commercial marketplace that can be bought and used by one of more government entities without requiring significant in-house developments or one-off government-funded developments. COTS products, such as Cúram, typically require configuration which are tailored for specific uses. Customers who use the Cúram platform for social service consumption use our product because it is often mandated that a single application be used across many government and business programs, as such products may offer significant savings in procurement, development, and maintenance. Only Cúram offers cross-agency, configurable options to support multiple agencies, multiple-program types using a single application platform.

The Cúram platform was built and designed to accommodate social service and healthcare organizations exclusively. Additionally, our product management team consists of domain subject matter expertise in the area of social services. None of the competing vendor’s technical architectures are prebuilt with domain-specific content that is targeted to a streamlined business segment with over 300+ years of collective hands-on domain expertise overseeing its application in the market place.

Data Model Design

Only the IBM Cúram platform offers an end-to-end data model integrating all the case management, rules, workflow, and administrative functions in a single platform.

Cúram: Cúram modules are built on top of a single data model. This single data model approach allows for integrated case management across social service programs, within the same application. And while there is a single data model, it allows for incremental modernization while maintaining the integrity and independence of a single department like Nebraska’s Medicaid and Long Term Care department. The architecture and decision to have a single data model within Cúram was a

critical design feature. Without it, each one of the solution area such as eligibility, Medicaid, child welfare, cash assistance and food stamps would require a separate data model requiring heavily configured data architecture assets to support cross-application activity. To establish an integrated case would require several data integration tools to simply surface data at the presentation layer. Building out a reliable case takes time and understanding of the rules and workflows, which are not associated with the data model. The lack of integration would cause problems in ensuring data is normalized across modules for a public services organization.

SOA and Web-Services Enablement

IBM Cúram, using its SOA and Web-Services based approach, is the industry leader who can easily go to market with a single platform and achieve the objectives of a social services agency with a very concise, well-architecture COTS product in a matter of weeks to months.

Only Cúram offers an open architecture and fully supports a framework for Web-Services enablement as part of its core application. Any application that requires integration into Cúram can leverage the open-standard SOA architecture. Cúram also offers a collection of adapters to integrate with industry leading ECM systems, ERP systems, CRM systems, and reporting solutions. If an adapter is not available, the Cúram architecture, built on J2EE, allows for the creation of customized user interfaces to integrate data from third-party applications without requiring separate application servers or services. The user experience is uniform, yet modular in nature.

Rules Engine

Only Cúram integrates the entire rules engine into the same platform it houses its case management solution. The cost of implementing the Cúram solution is significantly lower as a result of such a tightly coupled design.

Cúram: At the heart of any social service agency are rules and regulations that the citizens and agency adhere to for provisioning of services. Cúram's rules engine is fully integrated into the core Cúram Social Program Management Platform. An agency does not need to build out a separate infrastructure, maintain multiple application servers, and code each rule into a separate rules automation engine when using Cúram. The Web-based Cúram Express Rules engine capabilities can be configured using a Web browser.

Temporal Evidence Management

Cúram is the only COTS product on the market that supports the collection of evidence against a rule set, workflow, and integrated document management system in a single application.

Cúram: Cúram offers an evidence based approach to case management using its various enterprise modules based on public sector need. The evidence; however, is still managed and maintained as part of the single data model approach mentioned earlier. Every case can have a series of required evidence objects be submitted as part of a case. Rules and workflows govern temporal evidence collection. Cúram also allows for high volume ingestion of evidence to be stored in a third-party enterprise content management system without impacting the user experience through the use of our CMIS adapter. Additionally, the tightly coupled nature of a Cúram case and the presentation of relevant data as part of a single application interface should ensure a social services organization that a case is presented accurately and is verifiable.

Managing Calculations and Verifying Benefits

As a citizen's life evolves, so do the supporting pieces of evidence associated with their case. When a case requires a re-verification or a retroactive calculation of benefits, Cúram completes these activities without having to create a new case, manually manage the values associated with the evidence, and the need to create multiple response actions; Cúram can produce the response in real-time for both the public service organization and the citizen requiring the services.

There is a fully integrated audit trail as well as the ability to understand how calculations are derived based on the rules and regulations stored in Cúram. The calculations and all data associated with the case can be presented as part of the unified Cúram portal experience.

Our competitors do not have a single point solution to accomplish calculation, verification, and presentation of data in a cohesive uniform manner.

Technical Considerations – a Technical Architect's Perspective

The entire *SmartPro MedEE* solution is comprised of two identical PureApplication 1700-64e servers: one located in our Primary Omaha Nebraska Data Center, the other in our Secondary Data Center in Tempe Arizona.

These two servers are each an entirely self-contained "Cloud-in-a-Box" environment, comprising processing, memory, solid-state storage, and magnetic disk storage. External to these two servers, our Data Centers are providing the network fabric, such as routers and firewalls, and the Data Center Enterprise Management system, which monitors and manages the overall Data Center operations.

Unlike previous discrete server architectures, PureApplication Server implements a single box appliance-solution, combining hardware, storage, and middleware into a single integrated and certified whole. Featuring High-Availability design, with complete redundancy and no single points of failure, PureApplication Server provides *SmartPro MedEE* with an ideal hosting environment for the State. Some of the key features upon which *SmartPro MedEE* builds are:

High Availability, Out-Of-The-Box: PureApplication Server implements a fully redundant design OOTB: CPUs, Computing Nodes, Memory, Raid Storage, Busses, Power, Cooling, Network links – all are redundant, designed from the ground up as a "never-fail" design

High Reliability: The entire HW, OS, database, and Web/Application Server complement is an integrated, certified whole. It is designed and operated as a unified environment, pre-tested by IBM. Patches and changes are made at the Server level, not to individual components, and are tested and certified at the appliance level.

Easily Expanded: Without adding new racks or shutting down running application, the 64 Processor Core boxes of *SmartPro MedEE* can be expanded to 608 Cores, in units of 32 Cores. Additional disc storage can be added by expanding into standard Data Center SAN storage.

Quick to Deploy: PureApplication Servers are designed to be functional within 4 hours of uncrating the hardware. At that point, instantiating complex multi-tier and clustered system environments can be done in as little as 10-15 minutes, ready for application teams to load their software.

Lowered Risk: As much of the complex environmental middleware engineering is eliminated by the PureApplication Server's preconfigured Pattern logic, technical engineering is significantly reduced, leaving more schedule time for value-added application work, rather than designing and implementing system "plumbing." OS/Database/Application Server/Web Server integration, including that for complex clustered, load-balanced, auto-failover designs, is pre-configured and certified OOTB.

Flexibility: Provisioning Virtual Machines (VMs) with physical resources is a simple on-demand real-time capability, without service interruption. Is a Production Application Server over-burdened? We will provision it immediately with additional resources. Without interruption. Capacity is easily moved to where it is needed, when it is needed. Within business rules we configure as part of deploying *SmartPro MedEE*, PureApplication Server will self-tune its physical provisioning to optimize Production performance.

Tier III and Tier IV Data Centers

Our Omaha Data Center is certified at all Tier III criteria established by the Uptime Institute and meets Tier IV standards in important areas; Fault Tolerance, Representative Site Failures and Compartmentalization. Other standards are the same in both Tiers. Please see the Table IV-61: Data Center Tier Requirements below

The backup and replication strategy we propose, utilizes a solution that hosts and provides all maintenance and management tools, in our Tempe Arizona Data center, also rated at Tier III. The IBM PureApp appliance environment, accompanied with the redundant network and security standards existent in Omaha will provide full component redundancy and backup. Our strategy offers Nebraska a proven, secure, high availability and cost effective hosting environment, with the primary solution site in the state. Our Omaha Data Center is certified at all Tier III criteria established by the Uptime Institute and meets Tier IV standards in important areas; Fault Tolerance, Representative Site Failures and Compartmentalization. Other standards are the same in both Tiers. Please see the Data Center Tier Requirements table below. There we demonstrate this key representative attributes of Tier IV data centers, accompanied with our enhancements over a standard Tier III data center. Wipro continues to strive to provide world-class data center capabilities, while being prudent with cost effectiveness and standards that rival those certified Tier IV data centers, at a much more customer focused price point.

Table IV-61: Data Center Tier Requirements

Uptime Institute Standard	Tier III	Tier IV
Active Capacity Components to Support the IT Load	N+1 Each component has a backup.	2N+1 Each component has 2 backups.
Distribution Paths	1 Active; 1 Passive	2 Simultaneously Active

Uptime Institute Standard	Tier III	Tier IV
Concurrently Maintainable	Yes	Yes
Fault Tolerance **	No	Yes
Compartmentalization (multiple infra delivery paths) **	No	Yes
Continuous Cooling	Load Density Dependent	Class A
Engine-Generator System Run Time Limitation	Unlimited on consecutive hours of operation by "N" demand	Unlimited on consecutive hours of operation by "N" demand
Representative Planned Maintenance Shut Downs	None Required	None Required
Representative Site Failures **	1 Failure Every 2.5 Years	1 Failure Every 5 Years
Annual Site-Caused, End-User Downtime (based on field data)	1.6 hours	0.8 hours
** Denotes Tier III+ annotations in which Wipro DCs have matched Tier IV levels. (non-certified)		

Virtual Machines and System Environments

SmartPro MedEE is implemented as an entirely virtualized set of PureApplication Server Workloads, with each Workload corresponding to a named **SmartPro MedEE** Environment, such as "Production", "Sandbox", or "System Test".

Each Workload is comprised of a set of one or more Virtual Machines (VMs) that comprise the Environment. The design of each Environment's complement of VMs is driven by three primary considerations:

Security: Does the Environment require formal layers separated by network firewalls, such as the separation between the Web Server and Application Server tiers for an Environment facing the public Internet? If so, then distinct VMs will instantiate the tier, and utilize virtualized Network Interfaces to route traffic between the layers through a network firewall.

Reliability/High Availability: Does the Environment require High Availability, indicating a need for clustering? If so, then 2 or more VM's will be defined for that layer, which PureApplication Server automatically instantiates as a load-balanced cluster with auto-failover.

Performance: If performance requirements indicate load balancing, 2 or more VMs will be defined, which PureApplication Server automatically manages as a load-balanced cluster.

Isolation: If SLR and performance requirements indicate, then elements of an environment will be isolated from each other to minimize the possibility of performance degradation due to interference. For example, in the Production Environment, the Cúram application is hosted in one set of VMs, while the Business Intelligence component executes in another set – minimizing interference between BI/ad-hoc reporting and online transactional operations.

PureApplication Server greatly eases the complexity of engineering, instantiating, and managing rich VM-based systems. Using pre-defined Patterns, PureApplication Server automatically creates

preconfigured workloads that integrate VM definition with key middleware components: most importantly, the DB2 database and WebSphere Application and Web Server elements. This integration work is completed in moments, based on answers to a few simple questions. For example, in a Web Application deployment pattern, if the designer requests deploying 3 VMs for the Application Tier, the PureApplication Server will automatically configure the middleware for load-balanced, clustered, automatic failover operation.

VMs are in turn provisioned with physical resources: most importantly, CPU processing capacity (“Cores”) and Memory. PureApplication Server provides an exceptionally flexible environment to manage provisioning. Most importantly to *SmartPro MedEE* and the State, PureApplication Server continuously monitors resource utilization and performance of running Workloads. Based on configured business rules configured into the Workload, PureApplication will tune physical provisioning to meet defined resource and performance goals. Examples are the automatic addition of CPU cores is a particular VM is running above target utilization. If PureApplication Server is unable to meet its targets within the constraints imposed by the business rules, then it escalates an alert to our Data Center Enterprise Management system, signaling a possible need for human intervention.

Middleware software is often licensed based on the capacity of the hosting environment. For example, in *SmartPro MedEE*, our key middleware components of IBM DB2 and WebSphere are both normally licensed this way. When operating on this model, it is a common practice to minimize the purchased licensed capacity for these types of software components, to keep costs minimal. In practical terms, this limits the flexibility to respond to unforeseen circumstances, such as an immediate need for unplanned capacity. Adding capacity often entailed adding license rights permitting software to make use of that additional capacity.

PureApplication Server greatly relieves this constraint by including “All-you-can-eat” license entitlements for the several most important middleware components associated with capacity and performance: DB2 and WebSphere. PureApplication Server includes unlimited capacity licensing for these key middleware components, matching the CPU core allotment of the server. There is no need to consider license cost for these two items when planning the physical resourcing of the environment, within the physical limitations of the server itself – if a capacity bottleneck indicates that a database tier should be granted 4 additional CPU cores, and those physical cores can be made available, then the expansion is made by simply allocating the additional computing capacity to the virtual machine. There is no need to consider licensing additional capacity for DB2, or for WebSphere.

Overall, the Cloud-In-A-Box architecture of the IBM PureApplication Server and its virtualized environments grants us enormous flexibility in accommodating both planned and unplanned growth, with minimal financial impact and little risk.

Disaster Recovery

Wipro/IBM proposes two distinct but coordinated approaches to technical Disaster Recovery, matching two very different fundamental requirements.

For the Production Environment *SmartPro MedEE* maintains full performance and capacity while operating in fail-over mode. At the same time, *SmartPro MedEE* minimizes both the RTO and RPO, keeping the RTO less than 2 hours, and the RPO less than 5 minutes.

For the other non-Production Environments, *SmartPro MedEE* will accept lesser capacity and performance while operating in fail-over, and will provide a less stringent RTO (24 hours) and RPO (previous day's data).

At a high-level, Disaster Recovery for *SmartPro MedEE* consists of three components:

Ensuring that the required "code" is available at a contingency center. This includes all system, middleware, and tool-ware, all application code, and all configuration information. In practice, all Environments will use the same mechanism for keeping their code and configurations available in both Data Centers, and synchronized.

Restoring or otherwise obtaining access to each Environment's Data. This is where Production is treated differently from Non-Production: Production maintains a near real-time shadow of its database at the remote center, while Non-Production Environments rely upon restoring data from a copy or backup: hence a less aggressive RPO than for Production.

Swinging Networking across from the Primary to the Secondary Data Center. This operation transitions the circuit between Wipro's Primary Data Center and the State's Data Center over to our Secondary Center, and adjusts DNS to properly route traffic.

SmartPro MedEE does not dedicate any particular single piece of hardware or network gear to any particular Environment: there is no identifiable "backup" system. As a fully virtualized implementation, Environments are executed in the most appropriate location using assigned physical resources: however, those locations and resources can be shuffled as needed. All hardware is always available to all Environments within a single center, and is provisioned dynamically as required to meet resource utilization and performance goals. This model reduces overall costs of operation, as all hardware is always available to accomplish useful work, nothing sits idle and dedicated solely to a contingency that has small probability of occurrence.

In *SmartPro MedEE*, a single Environment executes entirely in one Data Center at a time, its natural home location. For example, Production's home location is our Primary Data Center; QA's home location is the Secondary Data Center. An Environment can be relocated from one center to other when necessary, either to balance loads or to respond to a contingency – but it only executes in one center at a time.

SmartPro MedEE maintains a high-capacity trunk line between our Omaha Primary Data Center and the State of Nebraska's Data Center. This circuit carries high volume traffic between the State and all *SmartPro MedEE* Environments: Production in our Primary Center, and Non-Production at both of our locations. Wipro routes traffic to and from our Secondary center over our own internal network connections. External traffic (public Internet) is routed directly to its target center, Primary and Secondary co-equally. In Disaster fail-over, this trunk line is swung over to point to our Secondary Data Center in Tempe, which would assume hosting of all Environments.

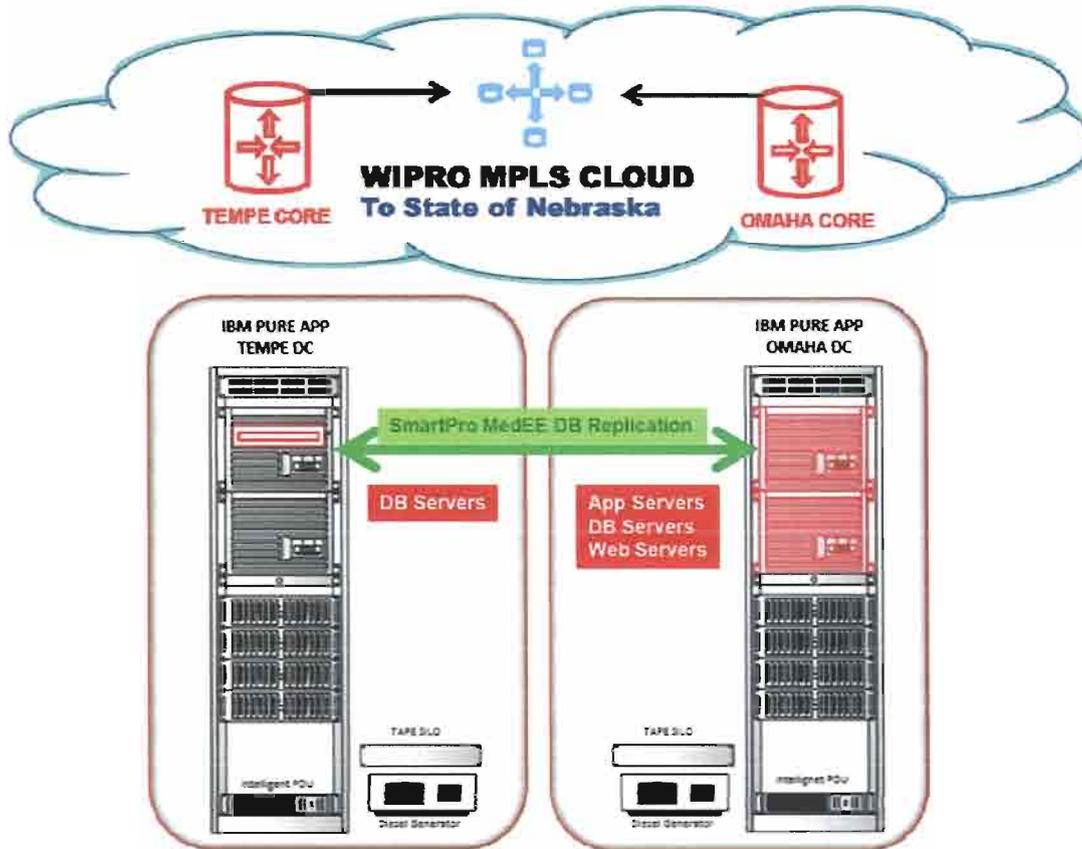

Figure IV-184: Disaster Recovery Design

During normal operations, all database updates to the Production Environment are shadowed to a copy of the database located in the Secondary Site, using DB2 log shipping capabilities. These updates are applied in near real-time to the shadow copy of the database, so that it is always ready to assume operation should the Primary Center be lost. The RPO is driven by the depth of the outbound queue of database updates that have not yet been shipped across and placed in the Secondary Site's receiving queue.

Should the Primary fail, the Secondary's copy of the Production Environment is instantiated by initializing its VM Workload, pointing it at the shadow database copy. The trunk line to the State is brought over to the Secondary Center, and DNS addressing updated to reflect the changed topology. Production is now ready to resume operation. As there is now only a single data center, log shipping is disabled in the Production Environment when it is running in contingency mode.

Non-Production Environments hosted in the Secondary Center remain online and available, with reduced physical resources assigned to their virtual environments. Other Environments that are normally hosted in our Primary Center, such as Integration Testing, System Testing, and Data Conversion, are brought back online in the Secondary Center by initiating their backup Workloads (virtual machines), which are synchronized with the primary copies by Change/Configuration Management. Their underlying data is generally present as of the previous day's backup – already available on local storage for smaller sets of data, available from tape backup for larger data sets.

If *SmartPro MedEE* were to lose the Secondary Center during normal operation, the same recovery approach is used to bring its Environments back online. The Primary Center's synchronized copy of each Environment's Workload is instantiated, executing against the most recent local copy of that Environment's data: either an on-disk backup taken the previous day for smaller datasets, or the equivalent tape backup for larger data sets.

Data Obfuscation

One of the challenges facing large healthcare systems is protecting data privacy. PHI data cannot be exposed to anyone except a select authorized few in the performance of their duties. In the Production Environment, there are multiple layers of controls in place to protect access to the sensitive data carried in the production database, ranging from encrypting data in the database itself up to Role-Based Access Controls enforced by the application. However, by themselves these controls are insufficient to support the needs of the non-Production Environments, such as Development, Testing, QA/UAT, Sandbox, and Training.

SmartPro MedEE uses IBM's InfoSphere Optim Data Privacy as its primary data obfuscation tool, bringing to the State a basic tool that is easy to use, fast, and efficient.

Some Environments, such as Training, are best served by small compact databases. Others, such as QA for Load, Stress, and Performance Testing demand complete, complex, and realistically sized databases to fulfill their missions. However, all require data that has been cleansed of sensitive information, while simultaneously retaining referential integrity and completeness. Normal system controls no longer suffice, as individuals without authority to access sensitive information must step into and play the roles of those who do have that authorization. The only answer is that the underlying information must be scrubbed clean of sensitive content, while remaining consistent with the shape and feel of the real data.

When the systems and their databases are small and simple, ad-hoc data sanitizing / obfuscation may sometimes suffice. But the demands of larger systems such as *SmartPro MedEE* cannot realistically be met by ad-hoc techniques: a systematic, thorough, efficient, and highly repeatable process must be in place. Here are a few of the main considerations:

Efficiency: the process must be efficient for data managers, for users of the process, and in terms of machine resources. Obfuscation is not a one-time event: at a minimum, any system change significantly altering the data model requires new or updated sanitized databases. The process of obtaining them cannot become a bottleneck constraining forward progress.

Integrity: changes to data must honor the referential integrity of the database, both explicit and implicit. For example, a sensitive data element to be sanitized might explicitly play a role as part of the primary, secondary, or foreign keys of the database, relationally linking one record to another: any obfuscation process must recognize this and ensure that all related elements are changed in concert so as to not "break" the database. Tools can generally pick up on these relationships, as they are explicitly defined in the database schema.

More subtle are implicit linkages not captured by the schema, but nevertheless critical to the integrity of the database. Denormalization may have introduced intentional redundancy, where the same sensitive element appears in multiple places that must remain synchronized.

Syntactic Consistency: fields often have syntax, a structure that must be honored, and that is known throughout the system. For example, a field's structure might be crucial for display, editing, and validation. So obfuscation cannot destroy a field's structure.

Human Factor: data is not arbitrary, devoid of meaning to the humans that consume it. For example, a "Name" is not a randomized string, it has the look and feel of being a person's name: Merely substituting a purely random string of letters for a value that is expected to carry meaning is not acceptable, as human consumers of that information become jarred by the dissonance of finding a random string of "garbage" where they expect to find a meaningful value. Obfuscation must produce realistic fictional values.

Strict Data Classification: effective obfuscation starts at the design level. All data must be classified as to its privacy requirements as part of data modeling, with that classification being a permanent part of the database data model.

To deliver on the requirements of obfuscation, the Wipro/IBM team will combine a mix of skilled staff, processes, and supporting tools.

Data Obfuscation is a full time Wipro Practice. The *SmartPro MedEE* team will draw upon specialists from this practice during the implementation phase, to setup the initial processes and tools, and to mentor the ongoing *SmartPro MedEE* staff so they can become self-sufficient in maintaining synchronized, obfuscated data in the future.

The *SmartPro MedEE* data modelers, using ER/Studio to manage the data model, are responsible for permanently capturing and maintaining in the model the security classification of all data.

The Data Obfuscation Practice specialist will setup the initial obfuscation process, relying heavily upon the IBM InfoSphere Optim Data Privacy tool (Optim) to assist with the heavy lifting of designing the obfuscation extract. This specialist will also mentor the database technical staff in the maintenance and ongoing operation of Optim and Obfuscation, so the team becomes self-reliant for the life of the project.

Master Data Management

SmartPro MedEE consolidates and interacts with data from many diverse sources, each having their own rules and conventions for identifying individual entities, such as citizens. From this diverse pool of data, it is imperative that *SmartPro MedEE* be able to recognize and identify the single individual appearing under many guises, and to assemble and maintain an accurate view of that person, including how they are identified and referenced by the systems and programs outside *SmartPro MedEE*. Creating a single unified view of a person's program eligibility and participation is the essence of Master Data Management and the Master Person Index (MPI) within *SmartPro MedEE*.

SmartPro MedEE builds its MPI capability on top of IBM InfoSphere MDM.

The MPI includes data and sources from N-FOCUS, the State's MMIS, and other systems that interface with *SmartPro MedEE*. Using matching attributes, an algorithm assigns a unique client identifier to each unique client, regardless of the number of times a client occurs across sources/programs. The MPI also stores the existing unique client identifier(s) currently used within legacy systems for cross-reference. This provides the ability to reuse the client identifier once a client is known to *SmartPro MedEE*.

The MPI will be configured to automatically merge and link duplicate client data based on rules set forth by the State. The MPI will use its algorithm and thresholds to decide whether to automatically link records, not link records, or create a task. Furthermore, the MPI will be configured to automatically delink clients based on updates to individual source records. The merge, link, and delink can also be done manually to overwrite the system if needed, using InfoSphere Inspector, or even integration messages. When changes are made to data, such as merges, links, delinks, or updates to demographic data, the MPI can automatically send an event notification, allowing pertinent programs to be notified of changes to client data, keeping the programs and MPI in sync.

The MPI software matches and searches on demographic data, including social security number and unique client identifiers. Furthermore, the MPI is capable of providing exact and partial match and Soundex to search and match clients within the MPI. The MPI also takes into account rules set forth by the State for both search and match. This is configurable out-of-the-box for InfoSphere MDM and is recognized as a core requirement for the MPI.

To properly manage data within the MPI, there are several ways the system can verify and alter certain demographic data for clients. To improve address accuracy, addresses are verified against postal records. This is included as part of the MPI functionality and can be performed in batch or real-time in accordance with program rules. Furthermore, assuming access to a managed list or service is accessible from the MPI, lists can be checked to verify whether a certain identifier is accurate within that federal system (i.e. social security number). Once again, this can be done in real-time or batch basis, depending on the final design decisions.

To help Nebraska minimize the disruption to workers during the transition to the new system, *SmartPro MedEE* provides the capability to display the same client differently, based on how a program wants to see it. These views can be created based on most-current attributes (displays the latest attribute regardless of source/program) or source-priority (shows a record based on a trusted source, regardless of when it was updated). The MPI can also be configured to have multiple views to see the same client. For instance, a client may be a part of three different programs. One program might want to see the user a certain way, highlighting their own program's attributes as opposed to another programs for its client view. However, another system might see the attributes based on when they were last updated, to give a most current view of a client. This approach gives the flexibility to view the same client in many different ways in order to meet multiple programs' requirements.

Master Data Management (MDM) as not a mere implementation of technology and tool set but a combination of multiple dimensions across business, technology and process that culminates into a successful MDM strategy and implementation. Wipro/IBM's approach to MDM is top down, starting with Data Governance Strategy, then proceeding to the physical implementation using tools and technologies.

Figure IV-185 below illustrates the building blocks of our MDM implementation:

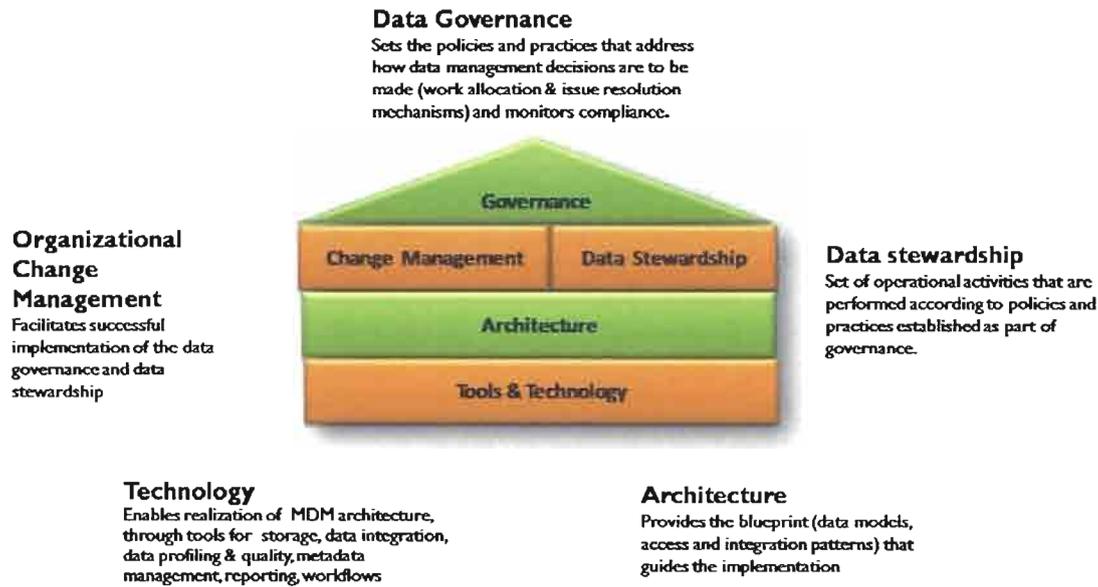

Figure IV-185: MDM Building Blocks

The Wipro/IBM framework for data governance encompasses the enterprise context with its constituent business processes and capabilities, which dictates the data governance strategy. The strategy has a clear charter, principles, practices, policies, and standards. They will be evolved as a management program jointly with all business and IT stakeholders during the initial phases of the project.

Page Left Intentionally Blank

D. DRAFT PROJECT WORK PLAN

Wipro/IBM provides a draft project work plan that includes detailed project tasks, deliverables, resources, milestones, and schedule to meet all CMS Enterprise Life Cycle (ELC) gated reviews and a successful *SmartPro MedEE* implementation. In addition, the detailed draft project work plan includes predecessors to identify task dependencies and assure the project timeline is within reason and accommodates the RFP timeline. Based on Wipro/IBM's past experiences, we are confident that the proposed work plan, broken down in a Work Breakdown Structures (WBS) format, will provide the detailed project tasks, deliverables, resources, milestones, and schedule to meet all the State of Nebraska's RFP Eligibility and Enrollment System requirements.

Milestones and Deliverables

Milestones and Deliverables

E. MILESTONES AND DELIVERABLES

Wipro understands the State of Nebraska’s expectation and need for a Medicaid Enrollment & Eligibility COTS System to replace the current N-FOCUS legacy system. The *SmartPro MedEE* solution was created upon a philosophy of providing a stable, scalable and well integrated COTS System which can be ultimately certified by CMS. In order to make way for that we are leveraging the CMS recommended Enterprise Life Cycle (ELC) approach for this implementation. Our Wipro/IBM team will leverage this approach in implementing the *SmartPro MedEE* solution in Nebraska.

F. PERSONNEL MANAGEMENT AND PLANNING

For more than 25 years, Wipro has provided health and life sciences organizations and agencies in the US and around the world with innovative, mission-critical solutions and services. We have led and supported the installation, configuration and complete enterprise system integration projects and other critical large-scale change initiatives with on-time, cost effective delivery.

We know that the State of Nebraska seeks a contractor to implement a comprehensive, state of the art, automated Eligibility and Enrollment System. The Wipro/IBM consortium represents a world class team of experts to deliver the proven, most widely trusted, state-of-the-art eligibility and enrollment system available in the market today. Because the implementation is under Wipro's leadership, Wipro will be responsible for successful project management throughout the life of the engagement.

Using CMS' Exchange Life Cycle and, assuming an agile and iterative development methodology, the Wipro/IBM Team has developed a comprehensive project work plan that identifies the interrelated tasks, activities and dependencies that must be accomplished or met within an extremely tight time line, to successfully complete on schedule. The major activities are identified and decomposed into smaller, more manageable components so that all project activities are specified in the plan. Each phase of the work plan is a complete unit of work activities, deliverables and milestones, integrated as part of the comprehensive work plan. This approach will provide the State's staff, other designated contractor staff and the Wipro/IBM Team with an unfettered view into the project's activities, progress, schedule and dependencies so the collective team can guide coordinate and collaborate as needed to keep the project on the critical path.

Supervision within the project is carried out by a unified project management staff under the leadership of well-qualified, experienced project managers who are self-directed and accountable to our clients for project success. The Wipro/IBM personnel is a blended team that has come into this project from different employers. Both Wipro and IBM are widely experienced with a track record of success in the health solutions market.

Of the many activities to be performed during the project, those listed below stand out as the most important for project success:

- Building on the final, refined Project Plan delivered after contract award, Wipro will implement established and proven multi-process project controls and reporting.
- We will also work with the State to make certain the most effective and efficient protocols are established for status reviews and issue reporting and resolution.
- Our standard project control system includes formalized project management software, a structured review, and issue tracking process and detailed procedures for effecting the submission/review/approval of all project deliverables.

Wipro commits to facilitating and encouraging active cross-functional, cross-group, and cross-location coordination and communication related to new technology and automation. Our collaborative approach to cultural change management provides a strong foundation on which to build the relationships needed to successfully manage change. As new technologies are introduced, Wipro will work closely with the State to identify affected stakeholders, develop appropriate communications plans and works diligently to bring those affected into the decision-making process. As the technology is implemented, Wipro works closely with user groups to identify impacts, test changes, incorporate feedback and implement changes in a way that fully supports their business needs.

Wipro commits to providing as part of an annual planning cycle, specific short-term steps and schedules for projects or changes to the proposed solution expected to occur within the first twelve (12) months.

Wipro acknowledges the need for and commits to providing reasonable access to specialists within the organization as needed to assist the Nebraska project team in developing and implementing the Long-Range IT Plan.

Wipro commits to planning and projecting costs to maintain, provide, replace, or eliminate any software to include the impact to any current processes.

Wipro commits to anticipating and planning for possible application interface problems due to more current releases of software.

Wipro commits to scheduling implementation of new releases, enhancements, and maintenance features with advance notification of at least four weeks unless approved by the state agency.

Wipro aligns our successful project management/oversight methodology and strategy with the Project Management Institute (PMI) model. We research and stay updated on industry best practices in the ever changing healthcare environment and continue to mature our processes to maximize responsiveness. Our Project Managers have the knowledge, ability, and experience relative to the disciplines described in the Project Management Body of Knowledge® (PMBOK®) and will follow and adhere to PMBOK throughout the entire life cycle of the project.

Wipro will take the lead in coordinating the efforts of the project management personnel representing our team involved in this project. Wipro fully commits that its project management staff will actively work to ensure a successful project, within scope, budget, and defined delivery dates.

Wipro believes that the “culture that values cooperation, teamwork and planning” is critical to project success. This is truly a multi-organizational effort, with no one organization truly having the self-contained resources to achieve project success alone.

Wipro understands the role and responsibilities of the Independent validation and verification (IV&V) function, with extensive experience based on our existing contract providing Missouri’s MMIS system and Fiscal Agent services.

Wipro will ensure that appropriate project management methodologies are employed, will respond to IV&V raised concerns and issues, take appropriate corrective actions, and respond appropriately to IV&V comments on project artifacts. Wipro believes that it is important to clarify the relationship between the IV&V contractor and the Wipro Project Management team, removing any ambiguities early, during project initiation.

Effective knowledge transfer from the State to us is equally important to achieving project success. One of the most common root causes of failure in large complex projects is the inability of the project team to gain timely and effective access to “customer” business and subject manager expertise. The State’s commitment to providing access to its expertise will prove crucial to the project’s success.

We will explicitly design these requirements into the formal processes of the Risk and Issue Management Plan. In this Plan, we will establish the Risk and Issue Logs, and the rules by which Risks, Issues, and Opportunities are identified, monitored, mitigated, assigned, tracked, and resolved.

As effective Risk Management is essential to success in executing larger, complex projects, we place great emphasis on the early recognition of potential risks. We commit to their documentation and the immediate establishment of appropriate sensors and metrics to continuously monitor the Risks’ probabilities of actually occurring, and turning into Issues. Commensurate with their potential impact and the current assessment of the probability of their occurrence, we prepare in advance plans to mitigate both the probability of their occurrence, and their adverse impact should they materialize.

Wipro places special emphasis on quality metrics: how quality is defined, and how it is measured and monitored. As a CMMi Level 5 organization, Wipro maintains an extensive quality metrics database covering

thousands of projects. Wipro will use this extensive library of hard data in its task of developing and evaluating the quality processes required for the NEES program. Once measures are established, they can be continuously evaluated against this historical data to establish credible estimates of true quality performance, and of likely outcomes of the processes being measured.

We will adhere to scheduling and holding a regular weekly project/operational status meeting, in which we will present and review the Change Management report (past and pending changes); the Issue Management log (materialized Risks/Issues and their Status); Project Activities (recent and near-term planned activities). We will deliver the initial written Status Report to the project team prior to each meeting, to allow for review and the development of questions and answers relating to the content of the report.

Change Management is considered key in delivering a quality system, on time, and within budget. Wipro follows a formal, documented Change Management Process to ensure that changes to a project are managed and handled appropriately. Our Change Management Process assumes the establishment of a Change Control Board committee. We recommend this committee be constituted of project stakeholders from both Wipro and the State agency. The Change Control Board is the authority and final decision maker regarding the acceptance or denial of all changes introduced to a project as outlined in our process flow to manage Change Requests.

Project change requests that are manageable within the established budget will be documented as zero-impact change requests and implemented with the State's approval. Changes that will impact a project in some manner will be put through the Change Management Process for the State's approval.

In accordance with our Change Management Process, all changes are submitted as formal Change Requests and are reviewed internally by the Project Manager who investigates the request and determines a remedy that provides a recommended solution. The project's Change Control Board is presented with the investigation documentation and determines the feasibility of the change request and the risk to the project.

Based on the nature of the change, the cost is added to the Change Request and submitted to the State for approval. When approved, the change will be added to the work plan schedule and tracked through completion.

Our methodology for managing change control identifies the project control items, the means by which to control and manage change, to those items and responsibilities of the team members in controlling and managing change. This rigorous process is undertaken so we can validate that each change introduced is appropriately defined, evaluated, and approved prior to implementation.

WIPRO LIMITED AND SUBSIDIARIES
NOTES TO THE CONDENSED CONSOLIDATED INTERIM FINANCIAL STATEMENTS
(₹ in millions, except share and per share data, unless otherwise stated)

1. The Company overview:

Wipro Limited (“Wipro” or the “Parent Company”), together with its subsidiaries (collectively, “the Company” or the “Group”) is a leading India based provider of IT Services, including Business Process Outsourcing (“BPO”) services and IT products, globally.

Wipro is a public limited company incorporated and domiciled in India. The address of its registered office is Wipro Limited, Doddakannelli, Sarjapur Road, Bangalore - 560 035, Karnataka, India. Wipro has its primary listing with Bombay Stock Exchange and National Stock Exchange in India. The Company's American Depository Shares representing equity shares are also listed on the New York Stock Exchange. These condensed consolidated interim financial statements were authorized for issue by the Company's Board of Directors on October 22, 2013.

2. Basis of preparation of financial statements

(i) Statement of compliance:

These condensed consolidated interim financial statements have been prepared in accordance with International Financial Reporting Standards and its interpretations (“IFRS”), as issued by the International Accounting Standards Board (“IASB”). Selected explanatory notes are included to explain events and transactions that are significant to an understanding of the changes in financial position and performance of the Company since the last annual consolidated financial statements as at and for the year ended March 31, 2013. These condensed consolidated interim financial statements do not include all the information required for full annual financial statements prepared in accordance with the IFRS.

(ii) Basis of preparation

These condensed consolidated interim financial statements are prepared in accordance with *International Accounting Standard (IAS) 34, “Interim Financial Reporting”*.

The condensed consolidated interim financial statements correspond to the classification provisions contained in *IAS 1(revised), “Presentation of Financial Statements”*. For clarity, various items are aggregated in the statements of income and statements of financial position. These items are disaggregated separately in the Notes, where applicable. The accounting policies have been consistently applied to all periods presented in these condensed consolidated interim financial statements.

All amounts included in the condensed consolidated interim financial statements are reported in millions of Indian rupees (₹ in millions) except share and per share data, unless otherwise stated. Due to rounding off, the numbers presented throughout the document may not add up precisely to the totals and percentages may not precisely reflect the absolute figures.

When an operation is classified as a discontinued operation the comparative income statement is re-presented as if the operation had been discontinued from the start of the comparative period. The Company has retrospectively applied the discontinued operation presentation from the start of the comparative period.

During the six months ended September 30, 2013, the Company has applied IAS 19 (as revised in June 2011) Employee Benefits and the related consequential amendments. IAS 19R has been applied retrospectively in accordance with transitional provisions. As a result, all actuarial gains or losses are immediately recognized in other comprehensive income and permanently excluded from profit or loss. Further, the profit or loss will no longer include an expected return on plan assets. Instead net interest recognized in profit or loss is calculated by applying the discount rate used to measure the defined benefit obligation to the net defined benefit liability or asset. The actual return on the plan assets above or below the discount rate is recognized as part of re-measurement of net defined liability or asset through other comprehensive income. The adoption of Revised IAS 19 did not have a material impact on the consolidated financial statements. Also, the comparative information has not been restated as the effect of the change in the accounting policy is not material on the consolidated interim financial statements.

The condensed consolidated interim financial statements have been prepared on a historical cost convention and on an accrual basis, except for the following material items that have been measured at fair value as required by relevant IFRS:

- a. Derivative financial instruments;
- b. Available-for-sale financial assets; and
- c. The defined benefit asset is recognised as plan assets, unrecognized past service cost, less the present value of the defined benefit obligation.

(iv) Convenience translation (unaudited)

The accompanying condensed consolidated interim financial statements have been prepared and reported in Indian rupees, the national currency of India. Solely for the convenience of the readers, the condensed consolidated interim financial statements as of and for the three and six months ended September 30, 2013, have been translated into United States dollars at the certified foreign exchange rate of \$ 1 = ₹62.58, as published by Federal Reserve Board of Governors on September 30, 2013. No representation is made that the Indian rupee amounts have been, could have been or could be converted into United States dollars at such a rate or any other rate.

(v) Use of estimates and judgment

The preparation of the condensed consolidated interim financial statements in conformity with IFRSs requires management to make judgments, estimates and assumptions that affect the application of accounting policies and the reported amounts of assets, liabilities, income and expenses. Actual results may differ from those estimates.

Estimates and underlying assumptions are reviewed on an ongoing basis. Revisions to accounting estimates are recognized in the period in which the estimates are revised and in any future periods affected. In particular, information about significant areas of estimation, uncertainty and critical judgments in applying accounting policies that have the most significant effect on the amounts recognized in the condensed consolidated interim financial statements is included in the following notes:

- a) **Revenue recognition:** The Company uses the percentage of completion method using the input (cost expended) method to measure progress towards completion in respect of fixed price contracts. Percentage of completion method accounting relies on estimates of total expected contract revenue and costs. This method is followed when reasonably dependable estimates of the revenues and costs applicable to various elements of the contract can be made. Key factors that are reviewed in estimating the future costs to complete include estimates of future labour costs and productivity efficiencies. Because the financial reporting of these contracts depends on estimates that are assessed continually during the term of these contracts, recognized revenue and profit are subject to revisions as the contract progresses to completion. When estimates indicate that a loss will be incurred, the loss is provided for in the period in which the loss becomes probable. To date, the Company has not incurred a material loss on any fixed-price and fixed-timeframe contract.
- b) **Goodwill:** Goodwill is tested for impairment at least annually and when events occur or changes in circumstances indicate that the recoverable amount of the cash generating unit is less than its carrying value. The recoverable amount of cash generating units is determined based on higher of value-in-use and fair value less cost to sell. The calculation involves use of significant estimates and assumptions which includes revenue growth rates and operating margins used to calculate projected future cash flows, risk-adjusted discount rate, future economic and market conditions.
- c) **Income taxes:** The major tax jurisdictions for the Company are India and the United States of America. Significant judgments are involved in determining the provision for income taxes including judgment on whether tax positions are probable of being sustained in tax assessments. A tax assessment can involve complex issues, which can only be resolved over extended time periods. Though, the Company considers all these issues in estimating income taxes, there could be an unfavorable resolution of such issues.
- d) **Deferred taxes:** Deferred tax is recorded on temporary differences between the tax bases of assets and liabilities and their carrying amounts, at the rates that have been enacted or substantively enacted at the reporting date. The ultimate realization of deferred tax assets is dependent upon the generation of future taxable profits during the periods in which those temporary differences and tax loss carry-forwards become deductible. The Company considers the expected reversal of deferred tax liabilities and projected future taxable income in making this assessment. The amount of the deferred income tax assets considered realizable, however, could be reduced in the near term if estimates of future taxable income during the carry-forward period are reduced.
- e) **Business combination:** In accounting for business combinations, judgment is required in identifying whether an identifiable intangible asset is to be recorded separately from goodwill. Additionally, estimating the acquisition

measurements are based on information available at the acquisition date and are based on expectations and assumptions that have been deemed reasonable by management. Changes in these judgments, estimates, and assumptions can materially affect the results of operations.

- f) **Other estimates:** The preparation of financial statements involves estimates and assumptions that affect the reported amount of assets, liabilities, disclosure of contingent liabilities at the date of financial statements and the reported amount of revenues and expenses for the reporting period. Specifically, the Company estimates the uncollectability of accounts receivable by analyzing historical payment patterns, customer concentrations, customer credit-worthiness and current economic trends. If the financial condition of a customer deteriorates, additional allowances may be required. Similarly, the Company provides for inventory obsolescence, excess inventory and inventories with carrying values in excess of net realizable value based on assessment of the future demand, market conditions and specific inventory management initiatives. If market conditions and actual demands are less favorable than the Company's estimates, additional inventory provisions may be required. In all cases inventory is carried at the lower of historical cost and net realizable value. The stock compensation expense is determined based on the Company's estimate of equity instruments that will eventually vest.

3. Significant accounting policies

Please refer to the Company's Annual Report for the year ended March 31, 2013 for a discussion of the Company's other critical accounting policies.

New Accounting standards adopted by the Company:

The Company has, with effect from April 01, 2013, adopted the following new accounting standards and amendments to accounting standards, including any consequential amendments to other accounting standard.

Amendment to IAS 1 "Presentation of Financial Statements" that will improve and align the presentation of items of other comprehensive income (OCI) in financial statements prepared in accordance with International Financial Reporting Standards (IFRSs). Consequent to the adoption of Amendments to IAS 1, the Company has modified the presentation of items of other comprehensive income in the consolidated statement of comprehensive income, to present separately items that may be reclassified subsequently to profit or loss from those that will not be. The adoption of amendment to IAS 1 has no impact on the recognised assets, liabilities and comprehensive income of the Company.

Amendments to IFRS 7 – *Financial Instruments Disclosures* *

IFRS 10 - *Consolidated Financial Statements (2011)* *

IFRS 12 - *Disclosure of Interests in Other Entities* *

IFRS 13 – *Fair Value Measurement* *

IAS 19 – *Employee Benefits (2011)* *

* the adoption of these accounting standards including consequential amendments did not have any material impact on the consolidated financial statements of the Company.

New Accounting standards not yet adopted by the Company:

A number of new standards, amendments to standards and interpretations are not yet effective for annual periods beginning after 1 April 2013, and have not been applied in preparing these consolidated financial statements. These are:

In November 2009, the IASB issued the chapter of *IFRS 9 "Financial Instruments relating to the classification and measurement of financial assets"*. The new standard represents the first phase of a three-phase project to replace *IAS 39 "Financial Instruments: Recognition and Measurement"* (IAS 39) with IFRS 9 Financial Instruments (IFRS 9). IFRS 9 uses a single approach to determine whether a financial asset is measured at amortized cost or fair value, replacing the many different rules in IAS 39. The approach in IFRS 9 is based on how an entity manages its financial assets (its business model) and the contractual cash flow characteristics of the financial assets. In October 2010, the IASB added the requirement relating to classification and measurement of financial liabilities to IFRS 9. Under the amendment, an entity measuring its financial liability at fair value, can present the amount of fair value change attributable to entity's own credit risk in other comprehensive income. Further the IASB also decided to carry-forward unchanged from IAS 39 requirements relating to de-recognition of financial assets and financial liabilities. IFRS 9 is effective for fiscal years beginning on or after January 1, 2015. Earlier application is permitted. The Company is evaluating the impact these amendments will have on the Company's consolidated financial statements.

liabilities". The purpose of the amendment is to clarify some of the requirements for offsetting financial assets and financial liabilities on the statements of financial position. This includes clarifying the meaning of "currently has a legally enforceable right to set-off" and also the application of the IAS 32 offsetting criteria to settlement systems (such as central clearing house systems) which apply gross settlement mechanisms that are not simultaneous. The amendment is effective retrospectively for fiscal years beginning on or after January 1, 2014. Earlier application is permitted. The Company is evaluating the impact these amendments will have on the Company's consolidated financial statements.

4. Demerger of diversified business and discontinued operations

During the financial year 2012-13, the Company had initiated and completed the demerger of its consumer care and lighting, infrastructure engineering and other non-IT business segment (collectively, "the Diversified Business"). The scheme was effective March 31, 2013 after the sanction of the Honorable High Court and filing of the certified copy of the scheme with the Registrar of Companies.

Following the Effective Date, the Diversified Business is classified and presented in the consolidated financial statements as discontinued operation in accordance with IFRS 5 – Non-Current Assets Held for Sale and Discontinued Operations. The Demerger is considered as business under common control and hence is outside the scope of application of IFRS 3 and IFRIC 17. Accordingly, assets and liabilities of the Diversified Business as on the Effective Date are at their carrying values.

In connection with the demerger, all subsidiaries which pertained to the Diversified Business were transferred to the Resulting Company. Certain of these subsidiaries in turn possessed subsidiaries which do not pertain to the Diversified Business and instead are considered a portion of the IT Services business segment. The Company has entered into a share purchase agreement with the Resulting Company to affect the transfer of the IT Services related subsidiaries back to Wipro. The transfer of the above subsidiaries will be complete on conclusion of the regulatory process. In the interim, the board of directors of the Resulting Company has authorized Wipro to retain all operating and management control for such subsidiaries, including the power to govern the operating and financial policies, the appointing of a majority of the board of directors, and appointment of key management personnel, and accordingly, the results of such subsidiaries are included with the results of the Company in the consolidated financial statements. Also refer note 24.

The results of the Diversified Business are as follows:

	Three months ended September 30,		Six months ended September 30,	
	2012	2013	2012	2013

Deposits.....	422	86
Others.....	703	353
	₹ 10,738	₹ 11,731
Total.....	₹ 41,807	₹ 47,893

⁽¹⁾ Such deposits earn a fixed rate of interest and will be liquidated within 12 months

⁽²⁾ Others include ₹ 2,314 (March 31, 2013: ₹ 1,111) due from Wipro Enterprises Limited and its subsidiaries.

11. Loans and borrowings

A summary of loans and borrowings is as follows:

	As at	
	March 31, 2013	September 30, 2013
Short-term borrowings from bank.....	₹ 42,241	₹ 44,348
External commercial borrowing	20,147	9,394
Obligations under finance leases.....	1,145	2,216
Term loans and others ⁽¹⁾	283	456
Total loans and borrowings.....	₹ 63,816	₹ 56,414

⁽¹⁾ Term Loans and others include ₹ 318 (March 31, 2013: Nil) due to Wipro Enterprises Limited and its subsidiaries.

12. Other liabilities and provisions

Other liabilities:	As at	
	March 31, 2013	September 30, 2013
Current:		
Statutory and other liabilities.....	₹ 4,042	₹ 3,675
Employee benefit obligations.....	4,011	5,306
Advance from customers.....	2,405	2,508
Others ⁽¹⁾	531	2,895
	₹ 10,989	₹ 14,384
Non-current:		
Employee benefit obligations.....	₹ 2,812	₹ 2,551
Others.....	578	356
	₹ 3,390	₹ 2,907
Total.....	₹ 14,379	₹ 17,291

⁽¹⁾ Others include ₹ 1,803 (March 31, 2013: Nil) due to Wipro Enterprises Limited and its subsidiaries

	March 31, 2013	September 30, 2013
Provisions:		
Current:		
Provision for warranty.....	₹ 305	₹ 286
Others.....	<u>869</u>	<u>842</u>
	<u>₹ 1,174</u>	<u>₹ 1,128</u>
Non-current:		
Provision for warranty.....	<u>₹ 9</u>	<u>₹ 3</u>
Total.....	<u>₹ 1,183</u>	<u>₹ 1,131</u>

Provision for warranty represents cost associated with providing sales support services which are accrued at the time of recognition of revenues and are expected to be utilized over a period of 1 to 2 years. Other provisions primarily include provisions for tax related contingencies and litigations. The timing of cash outflows in respect of such provision cannot be reasonably determined.

13. Financial instruments

Derivative assets and liabilities:

The Company is exposed to foreign currency fluctuations on foreign currency assets / liabilities, forecasted cash flows denominated in foreign currency and net investment in foreign operations. The Company follows established risk management policies, including the use of derivatives to hedge foreign currency assets / liabilities, foreign currency forecasted cash flows and net investment in foreign operations. The counter party in these derivative instruments is a bank and the Company considers the risks of non-performance by the counterparty as non-material.

The following table presents the aggregate contracted principal amounts of the Company's derivative contracts outstanding:

	As at	
	March 31, 2013	September 30, 2013
Designated derivative instruments		
Sell		
	\$ 777	\$ 765
	£ 61	£ 78
	¥ -	¥ -
	€ 108	€ 81
	AUD 9	AUD 4
Interest rate swaps	\$ 30	\$ 150
Net investment hedges in foreign operations		
Cross-currency swaps	¥ 24,511	¥ -
Others	\$ 357	\$ 302
	€ 40	€ 35
Non designated derivative instruments		
Sell		
	\$ 1,241	\$ 716
	£ 73	£ 77
	€ 47	€ 63
	AUD 60	AUD 60
	¥ -	¥ 815
	SGD -	SGD 8
	ZAR -	ZAR 169
Buy		
	\$ 767	\$ 664
	¥ 1,525	¥ -
Cross currency swaps	¥ 7,000	¥ -

The following table summarizes activity in the cash flow hedging reserve within equity related to all derivative instruments classified as cash flow hedges:

	As at September 30,	
	2012	2013
Balance as at the beginning of the period.....	₹ (1,605)	₹ 1,669
Net (gain)/loss reclassified into statement of income on occurrence of hedged transactions ⁽¹⁾	(22)	-
Changes in fair value of effective portion of derivatives.....	<u>2,041</u>	<u>(6,231)</u>
Gain/ (losses) on cash flow hedging derivatives, net.....	₹ 2,019	₹ (6,231)
Balance as at the end of the period.....	₹ 414	₹ (4,562)
Deferred tax thereon.....	₹ 5	₹ 731
Balance as at the end of the period, net of deferred tax.....	₹ 419	₹ (3,831)

⁽¹⁾ On occurrence of hedge transactions, net (gain)/loss was included as part of revenues.

As at March 31, 2013, September 30, 2012 and 2013, there were no significant gains or losses on derivative transactions or portions thereof that have become ineffective as hedges, or associated with an underlying exposure that did not occur.

14. Foreign currency translation reserve

The movement in foreign currency translation reserve attributable to equity holders of the Company is summarized below:

	As at September 30,	
	2012	2013
Balance at the beginning of the period.....	₹ 7,908	₹ 5,470
Translation difference related to foreign operations.....	2,817	10,552
Change in effective portion of hedges of net investment in foreign operations.....	(651)	(4,044)
Total change during the period.....	₹ 2,166	₹ 6,508
Balance at the end of the period.....	₹ 10,074	₹ 11,978

15. Income taxes

Income tax expense / (credit) has been allocated as follows:

	Three months ended September 30,		Six months ended September 30,	
	2012	2013	2012	2013
Income tax expense as per the statement of income.....	₹ 4,637	₹ 5,754	₹ 8,467	₹ 10,005
Income tax included in other comprehensive income on:				
unrealized gain / (loss) on investment securities	20	(43)	40	(27)
unrealized gain / (loss) on cash flow hedging derivatives	563	(365)	243	(911)
Defined benefit plan actuarial gains / (losses)	-	45	-	27
Total income taxes for continuing operations.....	₹ 5,220	₹ 5,391	₹ 8,750	₹ 9,094

Income tax expense consists of the following:

	Three months ended September 30,		Six months ended September 30,	
	2012	2013	2012	2013
Current taxes				
Domestic.....	₹ 4,201	₹ 4,439	₹ 6,999	₹ 7,846
Foreign.....	<u>1,403</u>	<u>913</u>	<u>2,739</u>	<u>1,604</u>
	₹ 5,604	₹ 5,352	₹ 9,738	₹ 9,450
Deferred taxes				
Domestic.....	₹ (511)	₹ (45)	₹ (592)	₹ (236)
Foreign.....	<u>(14)</u>	<u>447</u>	<u>(22)</u>	<u>791</u>
	₹ (525)	₹ 402	₹ (614)	₹ 555
Total income tax expense.....	₹ 5,079	₹ 5,754	₹ 9,124	₹ 10,005

	September 30,		September 30,	
	2012	2013	2012	2013
Total taxes of continuing operations.....	₹ 4,637	₹ 5,754	₹ 8,467	₹ 10,005
Total taxes of discontinued operations.....	442	-	657	-
Total income tax expense.....	₹ 5,079	₹ 5,754	₹ 9,124	₹ 10,005

Income tax expense is net of reversal of provisions recorded in earlier periods, which are no longer required, amounting to ₹ (93) and ₹ 131 for the three months ended September 30, 2012 and 2013 respectively and ₹ 354 and ₹ 643 for the six months ended September 30, 2012 and 2013 respectively.

16. Revenues (continuing operations)

	Three months ended September 30,		Six months ended September 30,	
	2012	2013	2012	2013
Rendering of services.....	₹ 83,284	₹ 98,476	₹ 164,567	₹ 187,771
Sale of products.....	8,919	9,251	18,463	17,250
Total revenues.....	₹ 92,203	₹ 107,727	₹ 183,030	₹ 205,021

17. Expenses by nature (continuing operations)

	Three months ended September 30,		Six months ended September 30,	
	2012	2013	2012	2013
Employee compensation.....	₹ 44,527	₹ 52,730	₹ 88,059	₹ 101,058
Raw materials, finished goods, process stocks and stores and spares consumed.....	7,240	7,038	15,096	13,718
Sub-contracting/technical fees/third party application....	9,001	10,541	17,745	20,747

Provision for doubtful debt.....	150	325	379	598
Miscellaneous expenses.....	1,576	1,928	3,377	3,591
Total cost of revenues, selling and marketing and general and administrative expenses	₹ 75,016	₹ 87,498	₹ 150,043	₹ 167,142

18. Finance expense (continuing operations)

	Three months ended September 30,		Six months ended September 30,	
	2012	2013	2012	2013
Interest expense.....	₹ 264	₹ 300	₹ 554	₹ 472
Exchange fluctuation on foreign currency borrowings, net.....	271	356	1,272	679
Total.....	₹ 535	₹ 656	₹ 1,826	₹ 1,151

19. Finance and other income (continuing operations)

	Three months ended September 30,		Six months ended September 30,	
	2012	2013	2012	2013
Interest income.....	₹ 2,113	₹ 3,065	₹ 3,936	₹ 6,190
Dividend income.....	129	60	477	110
Gains/(losses) on sale of investments.....	688	287	930	474
Total.....	₹ 2,930	₹ 3,412	₹ 5,343	₹ 6,774

A reconciliation of profit for the period and equity shares used in the computation of basic and diluted earnings per equity share is set out below:

Basic: Basic earnings per share is calculated by dividing the profit attributable to equity shareholders of the Company by the weighted average number of equity shares outstanding during the period, excluding equity shares purchased by the Company and held as treasury shares. Equity shares held by controlled Wipro Equity Reward Trust ('WERT') and Wipro Inc Benefit Trust (WIBT) have been reduced from the equity shares outstanding for computing basic and diluted earnings per share. Earnings per share and number of shares outstanding for the three and six months ended September 30, 2012 and 2013 have been adjusted for the grant of 1 employee stock option for every 8.25 employee stock option held by each eligible employee in terms of the demerger scheme as on the Record Date.

	Three months ended September 30,		Six months ended September 30,	
	2012	2013	2012	2013
Profit from continuing operation attributable to equity holders of the Company.....	₹ 15,044	₹ 19,321	₹ 29,700	₹ 35,555
Weighted average number of equity shares outstanding	2,453,173,688	2,454,919,674	2,452,384,099	2,454,939,900
Basic earnings per share.....	₹ 6.57	₹ 7.87	₹ 13.01	₹ 14.48
Basic earnings per share from continuing operations....	6.13	7.87	12.11	14.48

Diluted: Diluted earnings per share is calculated by adjusting the weighted average number of equity shares outstanding during the period for assumed conversion of all dilutive potential equity shares. Employee share options are dilutive potential equity shares for the Company.

The calculation is performed in respect of share options to determine the number of shares that could have been acquired at fair value (determined as the average market price of the Company's shares during the period). The number of shares calculated as above is compared with the number of shares that would have been issued assuming the exercise of the share options.

	Three months ended September 30,		Six months ended September 30,	
	2012	2013	2012	2013
Profit from continuing operation attributable to equity holders of the Company.....	₹ 15,044	₹ 19,321	₹ 29,700	₹ 35,555
Weighted average number of equity shares outstanding.....	2,453,173,688	2,454,919,674	2,452,384,099	2,454,939,900
Effect of dilutive equivalent share options.....	5,015,010	6,839,742	5,304,976	6,611,736
Weighted average number of equity shares for diluted earnings per share.....	<u>2,458,188,698</u>	<u>2,461,759,416</u>	<u>2,457,689,075</u>	<u>2,461,551,636</u>
Diluted earnings per share.....	₹ 6.55	₹ 7.85	₹ 12.98	₹ 14.44
Diluted earnings per share from continuing operations.....	6.12	7.85	12.08	14.44

21. Employee benefits (continuing operations)

a) Employee costs include:

	Three months ended September 30,		Six months ended September 30,	
	2012	2013	2012	2013
Salaries and bonus.....	₹ 43,447	₹ 51,706	₹ 85,965	₹ 98,862
Employee benefit plans				
Gratuity.....	114	142	321	275
Contribution to provident and other funds..	893	732	1,683	1,706
Share based compensation	73	150	90	215
	<u>₹ 44,527</u>	<u>₹ 52,730</u>	<u>₹ 88,059</u>	<u>₹ 101,058</u>

The employee benefit cost is recognized in the following line items in the statement of income:

	Three months ended September 30,		Six months ended September 30,	
	2012	2013	2012	2013
Cost of revenues.....	₹ 37,478	₹ 44,036	₹ 73,891	₹ 84,544
Selling and marketing expenses.....	4,271	5,748	8,375	10,756
General and administrative expenses.....	2,778	2,946	5,793	5,758
	<u>₹ 44,527</u>	<u>₹ 52,730</u>	<u>₹ 88,059</u>	<u>₹ 101,058</u>

The Company has granted nil options under RSU option plan during the three and six months ended September 30, 2012 and 2013.

The Company has adopted Revised IAS 19 with effect from April 01, 2013. The impact of adoption of Revised IAS 19 on consolidated financial statements is not material.

22. Commitments and contingencies

Capital commitments: As at March 31, 2013 and September 30, 2013, the Company had committed to spend approximately ₹ 1,259 and ₹ 1,279 respectively, under agreements to purchase property and equipment. These amounts are net of capital advances paid in respect of these purchases.

Guarantees: As at March 31, 2013 and September 30, 2013, performance and financial guarantees provided by banks on behalf of the Company to the Indian Government, customers and certain other agencies amount to approximately ₹ 23,753 and ₹ 22,785, respectively, as part of the bank line of credit.

Contingencies and lawsuits: The Company had received tax demands aggregating to ₹ 37,721 (including interest of ₹ 12,170) arising primarily on account of denial of deduction under section 10A of the Income Tax Act, 1961 in respect of profit earned by the Company's undertaking in Software Technology Park at Bangalore for the years ended March 31, 2001 to March 31, 2008. The appeals filed against the said demand before the Appellate authorities have been allowed in favor of the Company by the second appellate authority for the years up to March 31, 2007. Further appeals have been filed by the Income tax authorities before the Hon'ble High Court. For the year ended March 31, 2008, based on DRP directions confirming the position of the assessing officer, the final assessment order was passed by the assessing officer. The Company has filed an appeal against the said order before the Appellate Tribunal.

In March 2013, the Company received the draft assessment order, on similar grounds as that of earlier years, with a demand of ₹ 7,159 (including interest of ₹ 848) for the financial year ended March 31, 2009. The Company has filed its objections against the said demand before the Dispute Resolution Panel, within the time limit prescribed under the statute.

Considering the facts and nature of disallowance and the order of the appellate authority upholding the claims of the Company for earlier years, the Company believes that the final outcome of the above disputes should be in favor of the Company and there should not be any material impact on the condensed interim financial statements.

The Company is subject to legal proceedings and claims which have arisen in the ordinary course of its business. The resolution of these legal proceedings is not likely to have a material and adverse effect on the results of operations or the financial position of the Company.

The Contingent liability in respect of disputed demands for excise duty, custom duty, sales tax and other matters amounts to ₹ 2,273 and ₹ 2,269 as of March 31, 2013 and September 30, 2013, respectively.

23. Segment Information

The Company is organised by business, which primarily includes IT Services (comprising of IT Services and BPO Services) and IT Products and Others. Consequent to the demerger of Consumer Care and Lighting, Infrastructure Engineering and other non-IT businesses (collectively, "the Diversified Business"), the Company has re-organised the IT Services business with the object of making industry practice its focal point for performance evaluation and internal financial reporting and decision making. Consequently, the format for reporting IT services business has been changed to industry segments (Industry practice). Industry segments primarily consist of Banking, Financial Services and Insurance (BFSI), Healthcare and Life Sciences (HLS), Retail, Consumer, Transport and Government (RCTG), Energy, Natural Resources and Utilities (ENU), Manufacturing and Hi-tech (MFG), Global Media and Telecom (GMT) and others.

The IT Services reportable segment information for the comparative period by industry class of customers is not restated to reflect the above change since the meaningful segregation of the data is impracticable and cost to develop it is excessive. However, as required under IFRS 8, the Company has presented segment information for the current period on both the old basis and new basis of segmentation.

The Chairman of the Company has been identified as the Chief Operating Decision Maker (CODM) as defined by IFRS 8, "Operating Segments". The Chairman of the Company evaluates the segments based on their revenue growth and operating income.

Information on reportable segment on the new basis of segmentation for the three months ended September 30, 2013 is as follows:

	BFSI	HLS	RCTG	ENU	MFG	GMT	IT Services	IT Products	Reconciling items	Entity total
Revenue	26,570	10,174	14,916	15,897	19,100	14,022	100,679	9,374	(133)	109,920

	<u>Three months ended</u> <u>September 30,</u> <u>2012</u>	<u>Six months ended</u> <u>September 30,</u> <u>2012</u>
Revenues:		
Revenue as per segment reporting	₹ 106,566	₹ 213,096
Less: foreign exchange (gains) / losses, net included in segment revenue	(160)	(1,816)
Less: revenues for discontinued operations (note 4)	(14,194)	(28,199)
Inter-group transactions	(9)	(51)
Revenues for continuing operations	₹ 92,203	₹ 183,030
Profit before tax:		
Profit before tax as per segment reporting	₹ 21,249	₹ 41,192
Less: profit before tax for discontinued operations (note 4)	(1,507)	(2,872)
Profit before tax for continuing operations	₹ 19,742	₹ 38,320

The Company has four geographic segments: India, the United States, Europe and Rest of the world. Revenues from the geographic segments based on domicile of the customer for continuing operations are as follows:

	<u>Three months ended</u> <u>September 30,</u>		<u>Six months ended</u> <u>September 30,</u>	
	<u>2012</u>	<u>2013</u>	<u>2012</u>	<u>2013</u>
India.....	₹ 11,130	₹ 11,301	₹ 22,616	₹ 21,996
United States.....	43,372	46,241	86,174	90,907
Europe.....	24,100	27,810	48,273	54,347
Rest of the world.....	13,761	24,568	27,783	40,016
	₹ 92,363	₹ 109,920	₹ 184,846	₹ 207,266

Management believes that it is currently not practicable to provide disclosure of geographical location wise assets, since the meaningful segregation of the available information is onerous.

No client individually accounted for more than 10% of the revenues during the six months ended September 30, 2012 and 2013.

Notes:

- a) The company has the following reportable segments:
 - i) IT Services industry segments primarily consisting of Banking, Financial Services and Insurance (BFSI), Healthcare and Life Sciences (HLS), Retail, Consumer, Transport and Government (RCTG), Energy, Natural Resources and Utilities (ENU), Manufacturing (MFG), Global Media and Telecom (GMT) and others. Key service offering includes software application development and maintenance, research and development services for hardware and software design, business application services, analytics, consulting, infrastructure outsourcing services and business process outsourcing services.
 - ii) IT Products: The IT Products segment sells a range of Wipro personal desktop computers, Wipro servers and Wipro notebooks. The Company is also a value added reseller of desktops, servers, notebooks, storage products, networking solutions and packaged software for leading international brands. In certain total outsourcing contracts of the IT Services segment, the Company delivers hardware, software products and other related deliverables. Revenue relating to these items is reported as revenue from the sale of IT Products.
 - iii) Corporate activities such as treasury, legal and accounting, which do not qualify as operating segments under IFRS 8, and elimination of inter-segment transactions have been considered as 'reconciling items'.
 - iv) Hitherto the Demerger of the Diversified Business (refer note 4) during the year ended March 31, 2013, the "Consumer Care and Lighting" and "Others" have been discontinued effective March 31, 2013.
- b) Revenues include excise duty of ₹ 13 and ₹ 13 for the three months ended September 30, 2012 and 2013, respectively and ₹ 19 and ₹ 27 for the six months ended September 30, 2012 and 2013, respectively. For the purpose of segment reporting, the segment revenues are net of excise duty. Excise duty is reported in reconciling items.
- c) For the purpose of segment reporting, the Company has included the impact of 'foreign exchange gains / (losses), net' in revenues (which is reported as a part of operating profit in the statement of income).

basis of straight line amortization. The differential impact of accelerated amortization of stock compensation expense over stock compensation expense allocated to the individual business segments is reported in reconciling items.

- e) For evaluating the performance of the individual business segments, amortization of intangibles acquired through business combinations are reported in reconciling items.
- f) For evaluating the performance of the individual business segments, loss on disposal of subsidiaries are reported in reconciling items.
- g) The Company generally offers multi-year payment terms in certain total outsourcing contracts. These payment terms primarily relate to IT hardware, software and certain transformation services in outsourcing contracts. Corporate treasury provides internal financing to the business units offering multi-year payments terms. Accordingly, such receivables are reflected in capital employed in reconciling items. As of September 30, 2012 and 2013, capital employed in reconciling items includes ₹ 13,862 and ₹ 13,414 respectively, of such receivables on extended collection terms. The finance income on deferred consideration earned under these contracts is included in the revenue of the respective segment and is eliminated under reconciling items.
- h) Operating income of segments is after recognition of stock compensation expense arising from the grant of options for continuing operations is as follows:

Segments	Three months ended September 30,		Six months ended September 30,	
	2012	2013	2012	2013
IT Services	₹ 184	₹ 139	₹ 253	₹ 201
IT Products.....	11	6	16	10
Reconciling items.....	(122)	5	(179)	4
Total.....	₹ 73	₹ 150	₹ 90	₹ 215

*All the above direct subsidiaries are 100% held by the Company except that the Company holds 98% of the equity securities of Enthink Inc., 66.67% of the equity securities of Wipro Arabia Limited and 74% of the equity securities of Wipro Airport IT Services Limited.

[#] In connection with the demerger, all subsidiaries which pertained to the Diversified Business were transferred to the Resulting Company. Certain of these subsidiaries in turn possessed subsidiaries which do not pertain to the Diversified Business and instead are considered a portion of the IT Services business segment. The Company has entered into a share purchase agreement with the Resulting Company to affect the transfer of the IT Services related subsidiaries back to Wipro. The transfer of the above subsidiaries will be complete on conclusion of the regulatory process. In the interim, the board of directors of the Resulting Company has authorized Wipro to retain all operating and management control for such subsidiaries, including the power to govern the operating and financial policies, the appointing of a majority of the board of directors, and appointment of key management personnel, and accordingly, the results of such subsidiaries are included with the results of the Company in the consolidated financial statements.

2. IBM 2012 ANNUAL REPORT

Page Left Intentionally Blank

Dear IBM Investor:

I am pleased to report that in 2012, IBM achieved record operating earnings per share, record free cash flow and record profit margins, with revenues that were flat at constant currency. Operating earnings per share were up 13 percent, putting us well on track to our 2015 Road Map objective of at least \$20 of operating earnings per share. Importantly, we continued to deliver value to you, our owners.

This performance is a testament to our strategic position and capabilities, the discipline of our management systems, and the dedication and expertise of more than 430,000 IBMers around the world. Importantly, it reflects the impact of a distinct choice we have made about IBM's business and technology model.

IBM is an innovation company. Both in what we do and in how we do it, we pursue continuous transformation—always remixing to higher value in our portfolio and skills, in the capabilities we deliver to our clients and in our own operations and management practices.

This is not the only path to success in our industry, and it is not the easiest one. But it is ours. In this letter, I will report on our 2012 results, and then put them in context of our model of continuous transformation.

Results in 2012

Earnings per share: Diluted operating earnings per share in 2012 were \$15.25, a new record. This marked 10 straight years of double-digit EPS growth.

Margins: IBM's operating pre-tax income margin rose for the 10th consecutive year—to 22.2 percent, up 12 points since 2000.

Cash flow: IBM has consistently generated strong cash flow, a key indicator of real business performance. In 2012 our free cash flow was \$18.2 billion, a record for IBM and \$12 billion higher than a decade ago. We ended 2012 with \$11.1 billion of cash and marketable securities.

Revenue and income: Our revenue in 2012 was \$104.5 billion, down 2 percent as reported and flat at constant currency. We grew operating net income by 8 percent, to \$17.6 billion, our highest ever.

Investment and return to shareholders: In 2012 we invested \$3.7 billion for 11 acquisitions in key areas of software and services; \$4.3 billion in net capital expenditures; and \$6.3 billion in R&D. We were able to return \$15.8 billion to you—\$12 billion through share repurchases and \$3.8 billion through dividends. Last year's dividend increase was 13 percent, marking the 17th year in a row in which we have raised our dividend, and the 97th consecutive year in which we have paid one.

Since 2000, we have added \$14.6 billion to IBM's operating pre-tax profit base, and increased our pre-tax income 1.7 times, our operating earnings per share 3.6 times and our free cash flow 1.7 times. Cumulatively, we have generated about \$150 billion of free cash flow.

IBM's Model: Continuous Transformation

In an industry characterized by a relentless cycle of innovation and commoditization, one model for success is that of the commodity player—winning through low

price, efficiency and economies of scale. Ours is a different choice: the path of innovation, reinvention and shift to higher value.

We remix to higher value: We do so in our portfolio, in our organic R&D investment, and through targeted acquisitions and divestitures.

- *We remix our research and development:* Two decades ago, 70 percent of our researchers were working in materials science, hardware and related technology. Even the one-in-ten working in software were focused on operating systems and compilers. Today, 60 percent are in fields that support our key growth initiatives, such as the 400 mathematicians developing algorithms for business analytics, as well as a diverse group of specialists that include medical doctors, computational biologists, experts in natural language processing, and weather and climate forecasters. Since the beginning of 2010, we have spent \$19 billion on R&D, and in 2012 IBM earned the most U.S. patents for the 20th straight year, with a record total of 6,478.
- *We acquire new capabilities:* Organizations run into trouble when they look to fulfill a new strategy or provide the basis for transformation through acquisitions. We practice a disciplined approach that asks three questions: Does it build on or extend a capability IBM already has? Does the company have scalable intellectual property? Can it take advantage of our reach into 170 countries? Our balanced formula has built a strong track record since 2000, with more than 140 acquisitions.
- *We divest nonstrategic assets:* Always moving to the future isn't just about what you invent. It also involves choices about when to move on. Over the past decade we have divested almost \$15 billion of annual revenue—

businesses that no longer fit our strategy. If we had not done so, we would be a larger company today, but with lower margins and capabilities less essential to our clients.

2012 Performance

(\$ in billions except per share amounts)

For the year ended December 31:	2012
Operating earnings per share	\$ 15.25
Revenue	\$104.50
Operating net income	\$ 17.60
Free cash flow	\$ 18.20
Returned to shareholders	\$ 15.80

We make markets: We create new markets by category, by geography and by client.

- *We make markets by category:* Our software and services businesses today look very different from just a few years ago, offering new solution categories like MobileFirst, Social Business and Smarter Commerce. In our hardware business, momentum is building for our new PureSystems family, which launched the new category of workload-optimized systems. PureSystems has seen more than 2,300 installations in more than 70 countries in just two quarters.
- *We make markets by geography:* We are achieving strong results in the world's growth markets, working closely with businesses, institutions and governments as they seek to modernize their infrastructures and societies. We opened 144 new branches in these markets in 2012. We also continue remixing to more profitable opportunities in these countries, through Smarter Planet solutions such as Smarter Transportation, Smarter Finance and Smarter Cities.

- *We make markets by client:* We unlock new opportunity within our existing client base by creating capabilities for a new generation of IT buyers—from chief marketing officer to chief financial officer to the head of human resources and more. I discuss this in greater depth below.

We reinvent core franchises: Our System z enterprise server, introduced in 2012, is just the latest reinvention of the mainframe, and it drove System z's largest capacity shipment ever during the fourth quarter—with more than half of that growth coming from Linux workloads. Core software platforms such as WebSphere have been entirely transformed. And Information Technology Services, which was once a significant reseller of others' technology—generating good revenue but low margins—has shifted significantly to high-value services such as data center energy efficiency, security, and business continuity and recovery. This has contributed to a 6-point pre-tax income margin improvement in services since 2000.

We remix our skills and expertise: An innovation model means continuously remixing and deepening our expertise. For example, over the past three years we have increased our skill base in analytics by more than 8,100 experts. We have also added nearly 9,500 sellers in key areas of industry expertise—such as healthcare, energy, telecom and banking, as well as emerging sectors such as metals and mining. This year, IBM Global Business Services and IBM Research will launch the IBM Client Experience Lab, as well as joint GBS and Software practices in social business and mobility—including a tripling of our skill base in social and mobile technologies and doubling our skill base in Smarter Commerce.

We reinvent the enterprise itself: We have been highly disciplined about driving productivity—through the adoption of common, shared operations and systems; the streamlining of enterprise-wide processes; and the leveraging of global skills—all in the service of global integration. And we are now taking the next step, becoming a Smarter Enterprise:

- In part, this means applying analytics to every part of our business—changing how we manage risk, drive efficiency, increase marketing effectiveness and infuse business insight across the company.
- In part, it means using social technologies to identify IBM experts and enable them to deliver their knowledge and leverage our entire portfolio to create a seamless, high-value client experience.

This ongoing transformation gives us confidence that we will achieve our goal of \$8 billion in productivity savings over the course of our 2015 Road Map. Sixty percent of our productivity savings are reinvested in the business.

Revenue Increase for IBM Growth Initiatives in 2012

For the year ended December 31:	2012
Smarter Planet	25%
Business Analytics	13%
Cloud	80%
Growth Markets	7%*

* at constant currency

We use our strong cash flow strategically: Our cash flow generation fuels reinvestment in the business—in R&D, capital expenditures and acquisitions. At the same time, we deliver consistently strong returns to you, our owners.

Virginia M. Rometty
CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER

A New Era of Computing

To sustain an innovation model in our industry, a company must do more than accommodate major technology shifts. It must lead them. IBM has done this repeatedly over the past century—not only pioneering new technology models, but capturing significant economic value.

Today, another new wave is sweeping in—powered by Big Data, analytics, mobile, social and cloud. We anticipated this several years ago with our point of view on building a Smarter Planet—a world that was becoming instrumented, interconnected and intelligent. Now, the IT environment is moving from monolithic applications to dynamic services; from structured data at rest to unstructured data in motion; from PCs to unprecedented numbers and kinds of devices; from stable to unpredictable workloads; from static infrastructure to cloud services; and from proprietary standards to open innovation.

This shift plays strongly to IBM's historic position in enterprise computing. So we are, as we have so often done in the past, reshaping our investment, innovation and market strategies to lead.

We see three defining characteristics of this new era—what we call Smarter Computing:

1. Smarter Computing is designed for Big Data. Every two days, as much data is now generated as in all of human history up to 2003. This is “Big Data,” and it constitutes a vast new natural resource that can revolutionize industries and societies—with the right technology, capable of analyzing and extracting value and insight from it. This is one reason IBM's analytics business is growing so strongly, as we work with clients to drive intelligence into every aspect of their operations. Indeed, we have raised our 2015 Road Map target for Business Analytics from \$16 billion to

\$20 billion of revenue. We are also rapidly advancing the marketplace applications for our breakthrough “cognitive” computing system, Watson, which is already demonstrating its potential to transform healthcare and finance. We will introduce our first commercial Watson offerings this year.

—

To sustain an innovation model in our industry, a company must do more than accommodate major technology shifts.

2. Smarter Computing is built on software-defined environments. To handle today's volume, velocity and variety of data, enterprise data centers must become more dynamic and flexible. One way to think about this is to imagine entire IT infrastructures that are as programmable as individual systems. This new model is known as the “software-defined environment,” and cloud computing is its first manifestation. However, it will not be the last. This new model optimizes the entire computing “stack”—compute, storage and network resources—so that it can adapt to the type of work required. Hardware built for these new environments will be of significant business value—exemplified by IBM's systems today. From System z, to Power Systems, to storage, to our new PureSystems family, IBM systems are software-defined.

3. Smarter Computing is open. Only through open standards and platforms can enterprises support an expanding universe of heterogeneous data, devices and services, and engage in today's rich innovation ecosystems. The challenge is how to turn open approaches into successful business. IBM helped do so with Linux, Eclipse and Apache, supporting their growth into standards with vital industry ecosystems, and then developing high-value IBM business on top of them. Today, we are repeating this strategy through a number of collaborations such as OpenStack, a new open source cloud platform; Hadoop, an open source platform for Big Data; and several promising open source hardware projects.

Taken together, computing that is open, software-defined, and designed for Big Data constitutes a profound shift in information technology. And as in prior such shifts, it will create new markets and new clients. We are pursuing them aggressively.

New Clients, New Markets

As I mentioned, to capture the opportunities opened up by this new era of technology, IBM is engaging with new kinds of clients as we make new markets in Big Data/analytics, cloud for the enterprise, emerging economies and Smarter Planet. Indeed, from a business perspective, Smarter Planet is a platform for a growing array of new markets—such as Smarter Commerce, Smarter Cities and Social Business—and these new markets take concrete shape through the engagement and enablement of a new generation of IT clients. Today, we are working around the world and across multiple industries with many new leaders.

Perhaps the most active among them in embracing the new era of technology have been chief marketing officers, who are looking to reinvent the practice of marketing—

for example, by understanding and enabling customers as individuals, rather than “segments.” This helped our Global Business Services Smarter Commerce signings grow by nearly 200 percent in 2012—reaching \$2 billion.

At the same time, chief procurement officers are expected to increase their annual investment in Supplier Intelligence by 30 percent through 2015, as they reshape their global supply chains. And leaders of human resources are investing in analytics to build smarter workforces and social enterprises. One analyst has ranked IBM as number one in enterprise social business for the past three years.

“Front-office” transformation
has the potential to fuel
the biggest wave of business
technology investment
since the era of enterprise
resource planning.

City mayors are deploying Intelligent Operations Centers to transform public services in Davao, Philippines; Rio de Janeiro, Brazil; and Miami-Dade County, Florida. And urban transportation managers, such as those in Singapore and Eindhoven, Netherlands, are reducing urban congestion by offering drivers alternate route

recommendations in exchange for their cars' data on braking, acceleration and location.

This list could go on. "Front-office" transformation has the potential to fuel the biggest wave of business technology investment since the era of enterprise resource planning (ERP). And that creates a powerful set of conditions for the tens of thousands of business advisors and industry experts embedded in the world's greatest engine of technical innovation.

In sum, our strong strategic positioning, solid balance sheet, recurring revenue, robust profit streams, global reach—and especially our institutional capacity for innovation and continuous transformation—give us confidence that we will continue to provide differentiating value to our clients, employees, partners and communities—and therefore to you, our owners. "Generating Higher Value at IBM" (pp. 8-15) summarizes how.

On Being Essential

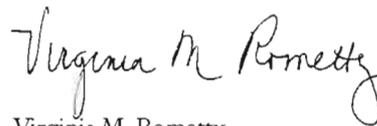

In closing, let me say a few words on the deeper meaning of this model of continuous transformation to higher value, at this particular moment in history.

As I have noted, an innovation model does not present an easy path, especially in an industry as fast-changing as ours. But once you are clear on your choice, it shapes everything you do: your business strategy, how you recruit talent, how you develop skills, how you invent, how you run the company. And for IBM, it means something more.

It speaks to IBMers' aspiration to be essential to each of our vital constituencies—our clients, our communities, our partners, our investors, and one another. We see this as our purpose as an enterprise—to serve their plans for success, their need to transform and their own unique sense of purpose.

The era opening before us offers a historic opportunity for both businesses and societies to pursue this higher purpose. A vast new natural resource is being unleashed—promising to do for our century what steam, electricity and fossil fuels did for the Industrial Age. The economic and societal potential of this new gusher of data is incalculable. It is the opportunity of our lifetime—and IBMers are determined to seize it.

It is in this spirit that I express my deep pride in the worldwide IBM team for bringing us to where we are, and my gratitude to you, our shareholders, for your unwavering support. I hope you share our excitement about your company's performance and the way in which IBMers are building a smarter planet and a brighter future.

Virginia M. Rometty

CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER

This letter includes selected information on certain non-GAAP financial measures that are made to facilitate a comparable view of the company's ongoing operational performance. For information about the company's financial results (including its operating pre-tax income, operating pre-tax income margin and operating earnings per share) and its free cash flow, which are in each case non-GAAP measures, see the company's Forms 8-K dated January 22, 2013 and February 28, 2013 (Attachment B—Non-GAAP Supplementary Materials).

Generating Higher Value at IBM

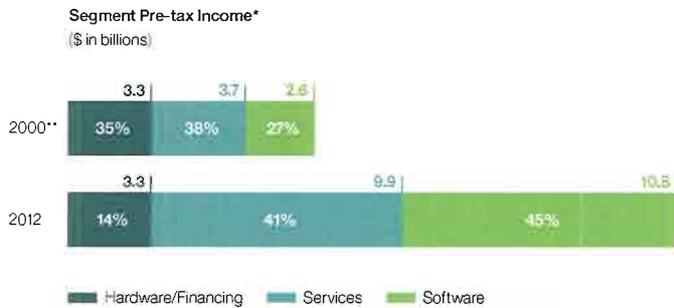

IBM is an innovation company. We pursue continuous transformation both in what we do and how we do it — always remixing to higher value in our offerings and skills, in our operations and management practices, and in the transformational capabilities we deliver to our clients.

2015 Road Map

Each year IBM describes how the company manages its business and serves its shareholders in a detailed financial road map.

A long-term perspective ensures IBM is well positioned to take advantage of major shifts occurring in technology, business and the global economy.

1. We continuously change our business mix toward higher-value, more profitable technologies and market opportunities.

* Sum of external segment pre-tax incomes not equal to IBM pre-tax income.
 ** Excludes Enterprise Investments and not restated for stock-based compensation. 2000 Segment PTT is reclassified to conform with 2012 presentation.

About 50% of IBM segment profit expected to come from Software by 2015.

2. We have become a globally integrated enterprise to capture new growth and productivity.

Growth Markets Share of Geographic Revenue

* Excluding divested businesses of PCs and printers.

IBM operations in more than 170 countries leverage the company's global scale and expertise.

A globally integrated model allows us to focus resources on client-oriented work and enables rapid deployment of IBM capabilities to growth markets. In 2012, we continued our rapid geographic expansion — opening 144 branch offices. Our growth markets delivered more than 60 percent of our geographic gross profit growth between 2010 and 2012.

Global integration of all our major enterprise functions — from service delivery to marketing — has enabled IBM to deliver enterprise productivity savings while improving quality.

Approaching 30% of geographic revenue from growth markets by 2015.

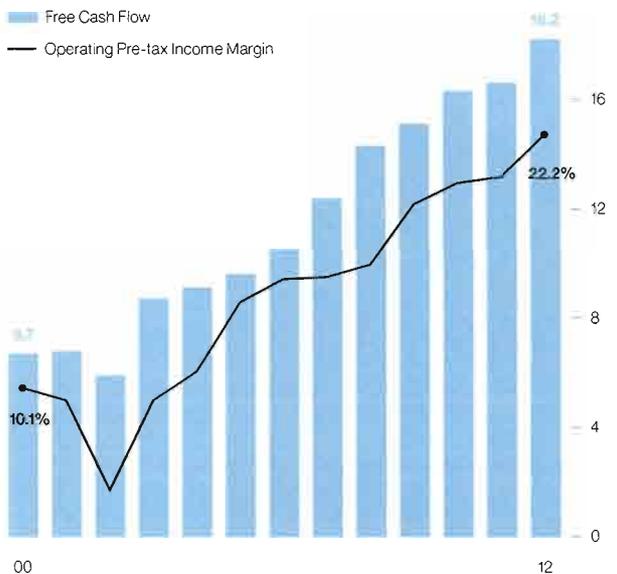

3. By aligning our business model with our clients' needs, we achieve our financial goals.

Our operating (non-GAAP) pre-tax income margin in 2012 was 22.2 percent, 12 points higher than in 2000. The primary driver of this performance was gross profit margin expansion, as a result of the shift in our business mix to more profitable, higher-value segments and improved productivity.

At the same time, we've increased R&D investment. Since the beginning of 2000, we've spent \$75 billion in R&D, enabling us to deliver key innovations and maintain U.S. patent leadership for our 20th consecutive year in 2012.

Our solid business model performance has resulted in consistently strong free cash flow. In 2012 our free cash flow was \$18.2 billion, \$12 billion higher than a decade ago.

Free Cash Flow and Operating Pre-tax Income Margin*
(\$ in billions)

*Excludes acquisition-related and nonrecurring adjustment-related charges.

4. This allows us to invest in future sources of growth and provide strong returns to our shareholders.

Primary Uses of Cash Since the Beginning of 2000
(\$ in billions)

Acquisitions: Since the beginning of 2000, we have acquired more than 140 companies in strategic areas including analytics, cloud, security and Smarter Commerce. We expect to spend \$20 billion in acquisitions over the 2015 Road Map period to support growth initiatives.

Capital Expenditures: We have invested more than \$55 billion since 2000 to advance our capabilities.

Share Repurchase and Dividends: Since 2000, we have returned almost \$150 billion to shareholders — paying \$26 billion in dividends and reducing the outstanding share count by over 35 percent. We expect to return \$70 billion to shareholders in our 2015 Road Map period — \$50 billion through gross share repurchases and \$20 billion in dividends.

\$70 billion expected to be returned to shareholders through 2015.

5. This delivers long-term value and performance for all key IBM stakeholders—investors, clients, employees and society.

Our 2015 Road Map continues the drive to higher value—with the expectation of at least \$20 operating (non-GAAP) EPS in 2015.

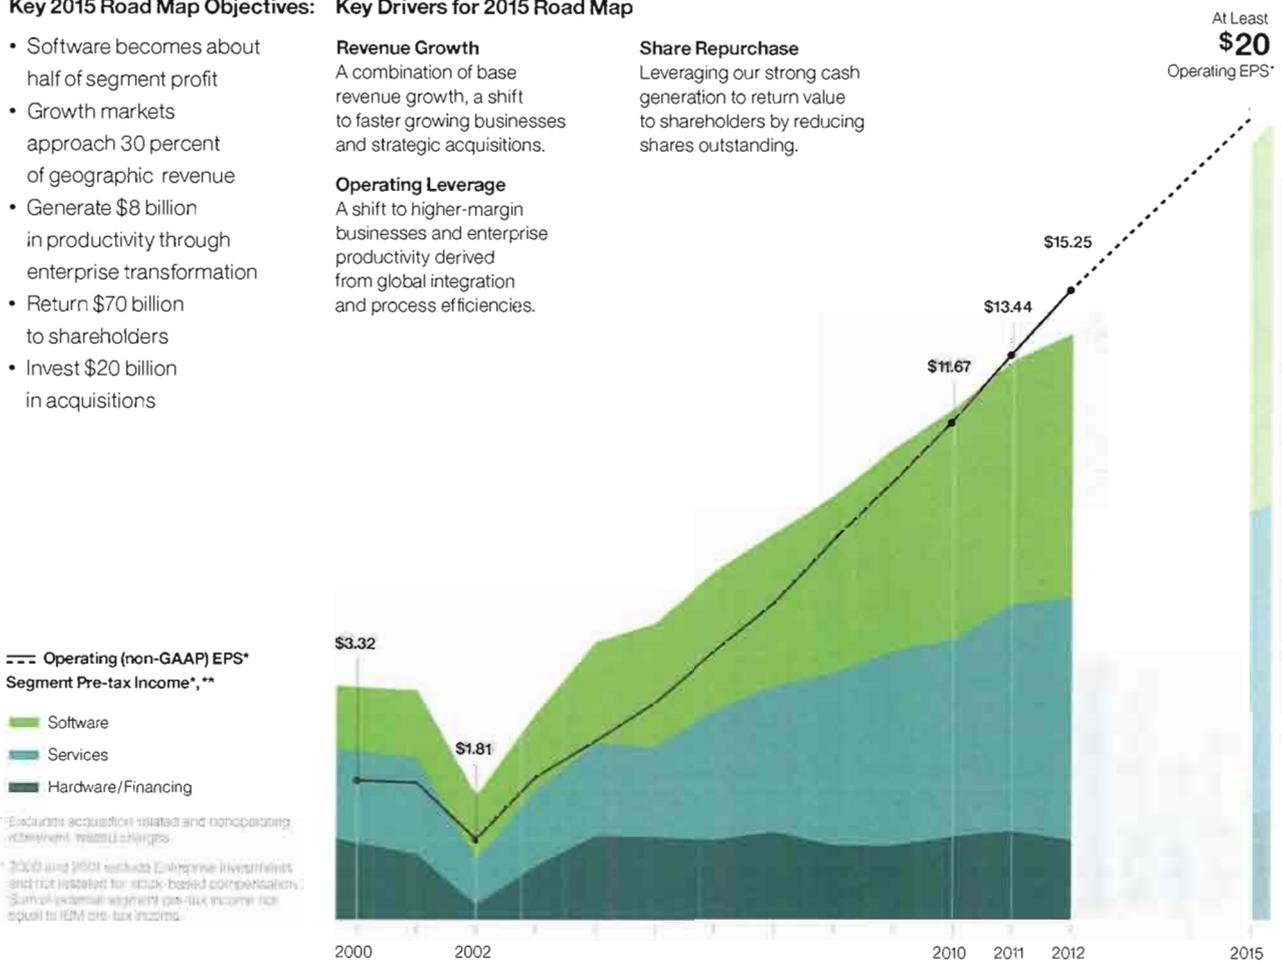

Key 2015 Road Map Objectives: Key Drivers for 2015 Road Map

- Software becomes about half of segment profit
- Growth markets approach 30 percent of geographic revenue
- Generate \$8 billion in productivity through enterprise transformation
- Return \$70 billion to shareholders
- Invest \$20 billion in acquisitions

Revenue Growth
A combination of base revenue growth, a shift to faster growing businesses and strategic acquisitions.

Operating Leverage
A shift to higher-margin businesses and enterprise productivity derived from global integration and process efficiencies.

Share Repurchase
Leveraging our strong cash generation to return value to shareholders by reducing shares outstanding.

6. Five years ago, we saw the emergence of a Smarter Planet—a world becoming instrumented, interconnected and intelligent.

The IT industry and the global economy have been transformed by massive amounts of data, new ways to deliver computing and the rise of mobile and social platforms.

Big Data is the planet's new natural resource.

Hundreds of billions of connected sensors and devices have created a massive, invisible flow of digital "1s" and "0s"—a global gusher of information.

Advanced analytics enable us to mine it.

Enterprises and institutions are analyzing this flow of streaming, unstructured data and acting upon those insights in real time.

Cloud computing is coming of age.

The model of computing known as "the cloud" delivers on-demand computing over the Internet. It brings new scale and efficiency to service delivery and enables more agile ways of doing business.

Social and mobile create a new platform for work.

With devices in hand, individuals now expect to interact with the world around them—as consumers, as students, as citizens. For many, mobile devices have supplanted the PC, consumer electronics and even the wallet.

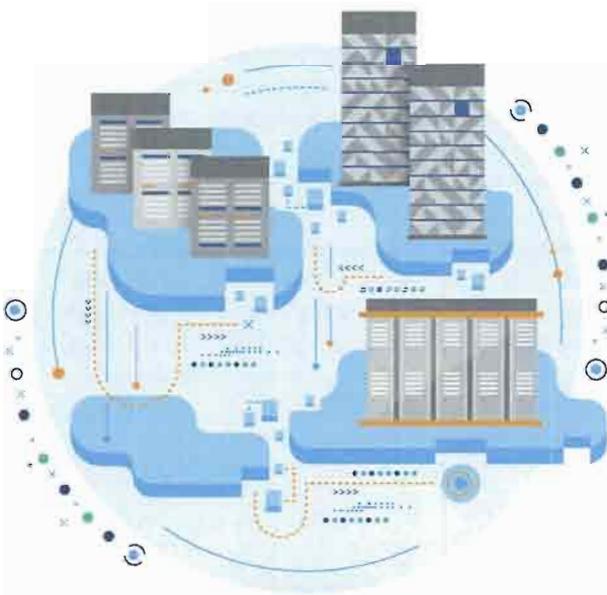

7. To lead this shift, IBM is pioneering a new computing model—what we call Smarter Computing. It has three core attributes.

Designed for Data

As new sources of data continue to grow in volume, variety and velocity, so too does their potential to revolutionize the decision-making processes in every industry—if organizations can analyze it all and extract insight.

IBM has the world's deepest portfolio of analytics solutions and software; 30,000 enterprise analytics engagements; a leading position in powerful optimized systems; and the business and industry expertise of 9,000 business analytics consultants, 400 researchers and 9 analytics solution centers. We have acquired 33 companies since 2005, including five in 2012, to build targeted analytics and information expertise—helping clients turn massive volumes of real-time, unstructured data into high-value knowledge available instantly.

Defined by Software

Entire IT environments can now be as simple, adaptable and programmable as individual systems are today — thanks to a new model known as the software-defined environment. Cloud is its first major manifestation — but it will not be the last.

In a software-defined environment, networks, storage and servers, as well as software, can be tuned flexibly to a desired workload. Hardware systems optimized for these new environments — such as IBM's System z mainframe, Power Systems, storage systems and our new PureSystems — are creating significant new business value.

IBM's SmartCloud manages 13 billion security events for more than 4,000 clients per day and connects more than 300,000 trading entities. IBM has also helped clients build more than 3,500 private clouds.

Open and Collaborative

An expanding universe of mobile devices, networked services and social enterprises requires open platforms. IBM helped open platforms such as Linux, Eclipse and Apache become standards with vital industry ecosystems, and then we developed high-value businesses on top of them. Today, IBM collaborates broadly to support open platforms such as OpenStack and Hadoop.

IBM has been the market leader in social enterprise software* for the past three years. With thousands of mobile experts, 270 patents in wireless innovations and 160 IBM Research scientists focused on mobile technologies, IBM has helped more than 1,000 clients become mobile enterprises. Looking ahead, we will integrate these capabilities with the powerful behavioral analytics of newly acquired Kenexa to help leaders of human resources build smarter workforces.

*IBS "Workday: Enterprise Social Software 2011 Vendor Brand," June 2011.

8. The infusion of digital intelligence into the world's systems is changing the way people, organizations and entire industries approach what they do.

In thousands of Smarter Planet client engagements, IBM is helping our clients seize competitive advantage, not only through improved productivity but by reframing their industry's issues in unexpected, often counterintuitive ways.

Smarter Stock Exchange

To compete with exchanges in places like London and New York, the Santiago Stock Exchange needed to handle the growing volume of high-frequency and algorithmic trading activity—and do so from the ground up. Working with IBM, it built a trade processing solution that increased capacity tenfold, cut latency to microseconds and enabled real-time fraud surveillance. The Exchange's transaction volume is up 50 percent in the first year.

Smarter Wind Energy

Vestas, the world's largest windmill manufacturer, is tapping into the power of an IBM supercomputer and Big Data analytics software to model past, present and future wind patterns—a process that involves huge amounts of data—to optimize the location and design of sites its customers are developing. Vestas's system is on track to digest and analyze 20 petabytes of information in hours instead of months. The result: fewer customer power disruptions and more predictable revenues for utilities.

Smarter Customer Retention

Pakistani telephone provider Ufone faced a challenge common to start-ups in emerging markets. After a period of rapid growth—reaching 24 million subscribers in less than a decade—it had to retain those customers in an increasingly competitive market. IBM analytics enabled it to scan call detail records in near-real time, flagging customers who fit the profile for a particular promotion. Today, by issuing offers customized to a user's unique usage patterns, Ufone has doubled its campaign response rates.

Smarter Cancer Treatment

Memorial Sloan-Kettering Cancer Center is working with IBM to use the cognitive computing capabilities found in IBM's Watson to help doctors develop personalized, evidence-based cancer treatment options. The system uses insights gleaned from the deep experience of Memorial Sloan-Kettering's world-renowned oncologists to provide individualized treatment options based on a patient's medical information, the synthesis of a vast array of updated and vetted treatment guidelines, and published research. The result: a decision support system for physicians that will offer individualized, confidence-weighted treatment options for their patients.

Smarter City Operations

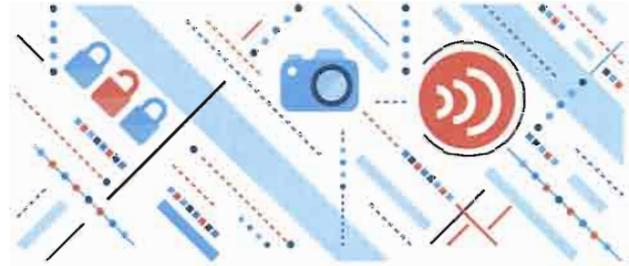

The Philippines city of Davao's 1.5 million citizens will be the first in Asia to benefit from an Intelligent Operations Center. It ties together data and operations of four agencies—crime prevention; emergency response; threat prevention and response; and traffic management. Geolocation mapping, in combination with GPS-equipped task forces on the ground, will allow officials to analyze building, street and infrastructure data to substantially reduce response times. A new early warning system will monitor key risk indicators so agencies can take quick action before situations escalate.

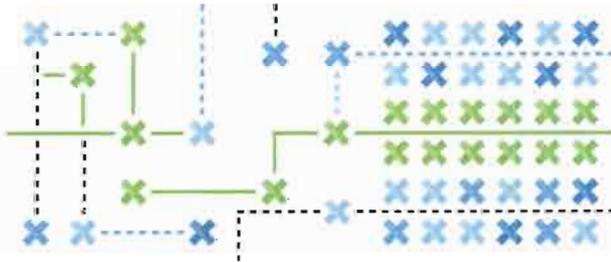

9. Looking ahead, IBM Research is probing the future of information technology.

For all its remarkable advances, computation in the past half-century—the era of “programmable” computers—has been limited to “yes/no” decisions. The new era now emerging will unlock far deeper understanding of the complexities and ambiguities of the real world—both natural and man-made.

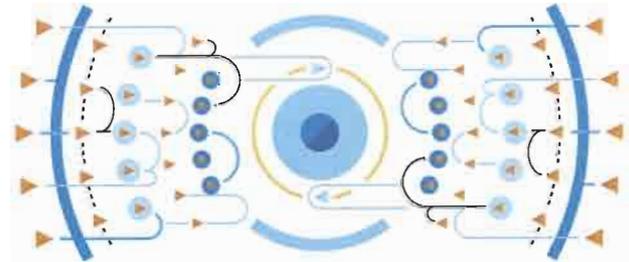

Doing so will require both steady incremental advances and true scientific breakthroughs that come only from deep, multidisciplinary research—such as that underway today in IBM’s labs.

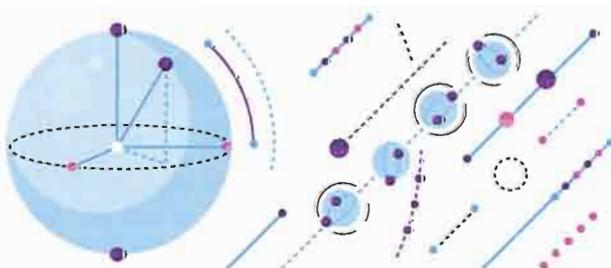

Massive-Scale Analytics for Cybersecurity IBM researchers have found cyber criminals hiding in billions of log files by surfacing small “tells” in the actions of attackers who elude even the most advanced virus detection.

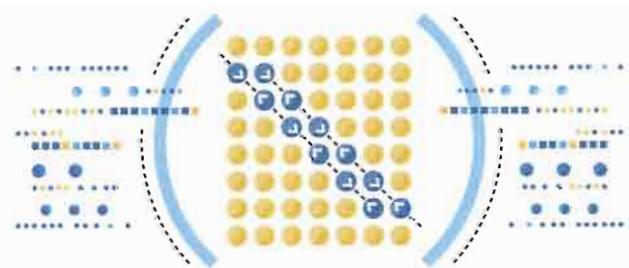

Accelerated Discovery IBM researchers are unlocking data-driven “white spaces,” such as finding new uses for drugs already proven safe in the data of 15 million patents, 18 million scientific papers, 10 million chemical compounds and 100 million genes.

“Synapse” Chip IBM researchers are now developing cognitive computer chips that learn without programming. Modeled on the human brain, they have already simulated more than 500 billion neurons and 100 trillion synapses.

Quantum Computing IBM researchers have taken a step closer to a practical quantum computer, based not only on digital “1s” and “0s” but also on multiphased “qubits” that enable millions of computations at once.

Atomic-Scale Memory IBM researchers have extended the frontiers of the unimaginably small by showing the possibility of storing a “bit” of memory on just 12 atoms. Such a breakthrough holds the potential to increase storage capacity one thousandfold.

“Generating Higher Value at IBM” includes selected information to certain non-GAAP financial measures that are made to facilitate a comparative view of the company’s ongoing operational performance. For information about the company’s financial results related to (i) operating pre-tax income, operating pre-tax income, margin and operating earnings (see filing area (i) here), cash flow for 2012, see the company’s SEC filing 10-K filed on January 29, 2013, and February 29, 2013 (Attachment II—Non-GAAP Supplementary Materials). For information about the company’s financial results related to (ii) growth markets, state of geographic revenue excluding diversified PCs, printers and (iii) free cash flow, see the case for 2012, see the company’s Form 8-K, submitted to the SEC on May 12, 2012 (Attachment II—Non-GAAP Supplementary Materials).

Financial Highlights

Overview

The financial section of the International Business Machines Corporation (IBM or the company) 2012 Annual Report includes the Management Discussion, the Consolidated Financial Statements and the Notes to the Consolidated Financial Statements. This Overview is designed to provide the reader with some perspective regarding the information contained in the financial section.

Organization of Information

- The Management Discussion is designed to provide readers with an overview of the business and a narrative on the company's financial results and certain factors that may affect its future prospects from the perspective of the company's management. The "Management Discussion Snapshot," on [pages 19 to 21](#), presents an overview of the key performance drivers in 2012.
- Beginning with the "Year in Review" on [page 26](#), the Management Discussion contains the results of operations for each reportable segment of the business and a discussion of the company's financial position and cash flows. Other key sections within the Management Discussion include: "Looking Forward" on [page 55](#), and "Liquidity and Capital Resources" on [pages 56 through 58](#).
- Global Financing is a reportable segment that is measured as a stand-alone entity. A separate "Global Financing" section is included beginning on [page 63](#).
- The Consolidated Financial Statements are presented on [pages 70 through 75](#). These statements provide an overview of the company's income and cash flow performance and its financial position.
- The Notes follow the Consolidated Financial Statements. Among other items, the Notes contain the company's accounting policies ([pages 76 to 86](#)), acquisitions and divestitures ([pages 87 through 91](#)), detailed information on specific items within the financial statements, certain contingencies and commitments ([pages 110 to 113](#)) and retirement-related benefits information ([pages 120 to 134](#)).
- The Consolidated Financial Statements and the Notes have been prepared in accordance with accounting principles generally accepted in the United States (GAAP).
- The references to "adjusted for currency" or "at constant currency" in the Management Discussion do not include operational impacts that could result from fluctuations in foreign currency rates. Certain financial results are adjusted based on a simple mathematical model that translates current period results in local currency using the comparable prior year period's currency conversion rate. This approach is used for countries where the functional currency is the local country currency. This information is provided so that certain financial results can be viewed without the impact of fluctuations in foreign currency rates, thereby facilitating period-to-period comparisons of business performance. See "Currency Rate Fluctuations" on [page 61](#) for additional information.
- Within the financial statements and tables in this Annual Report, certain columns and rows may not add due to the use of rounded numbers for disclosure purposes. Percentages reported are calculated from the underlying whole-dollar numbers.

Operating (non-GAAP) Earnings

In an effort to provide better transparency into the operational results of the business, the company separates business results into operating and non-operating categories. Operating earnings is a non-GAAP measure that excludes the effects of certain acquisition-related charges and retirement-related costs, and their related tax impacts. For acquisitions, operating earnings exclude the amortization of purchased intangible assets and acquisition-related charges such as in-process research and development, transaction costs, applicable restructuring and related expenses and tax charges related to acquisition integration. For retirement-related costs, the company characterizes certain items as operating and others as non-operating. The company includes defined benefit plan and nonpension postretirement benefit plan service cost, amortization of prior service cost and the cost of defined contribution plans in operating earnings. Non-operating retirement-related cost includes defined benefit plan and nonpension postretirement benefit plan interest cost, expected return on plan assets, amortized actuarial gains/losses, the impacts of any plan curtailments/settlements and multi-employer plan costs, pension insolvency costs and other costs. Non-operating costs are primarily related to changes in pension plan assets and liabilities which are tied to financial market performance and the company considers these costs to be outside the operational performance of the business.

Overall, the company believes that providing investors with a view of operating earnings as described above provides increased transparency and clarity into both the operational results of the business and the performance of the company's pension plans; improves visibility to management decisions and their impacts on operational performance; enables better comparison to peer companies; and allows the company to provide a long-term strategic view of the business going forward. For its 2015 earnings per share road map, the company is utilizing an operating view to establish its objectives and track its progress. The company's reportable segment financial results reflect operating earnings, consistent with the company's management and measurement system.

Forward-Looking and Cautionary Statements

Certain statements contained in this Annual Report may constitute forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995. Any forward-looking statement in this Annual Report speaks only as of the date on which it is made; the company assumes no obligation to update or revise any such statements. Forward-looking statements are based on the company's current assumptions regarding future business and financial performance; these statements, by their nature, address matters that are uncertain to different degrees. Forward-looking statements involve a number of risks, uncertainties and other factors that could cause actual results to be materially different, as discussed more fully elsewhere in this Annual Report and in the company's filings with the Securities and Exchange Commission (SEC), including the company's 2012 Form 10-K filed on February 26, 2013.

Management Discussion Snapshot

(\$ and shares in millions except per share amounts)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent/ Margin Change
Revenue	\$104,507	\$106,916	(2.3)%*
Gross profit margin	48.1%	46.9%	1.2 pts.
Total expense and other income	\$ 28,396	\$ 29,135	(2.5)%
Total expense and other income-to-revenue ratio	27.2%	27.3%	(0.1)pts.
Income before income taxes	\$ 21,902	\$ 21,003	4.3%
Provision for income taxes	5,298	5,148	2.9%
Net income	\$ 16,604	\$ 15,855	4.7%

Assets**	\$119,213	\$116,433	2.4%
Liabilities**	\$100,229	\$ 96,197	4.2%
Equity**	\$ 18,984	\$ 20,236	(6.2)%

* 0.0 percent adjusted for currency.

** At December 31.

The following table provides the company's operating (non-GAAP) earnings for 2012 and 2011.

(\$ in millions except per share amounts)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent Change
Net income as reported	\$16,604	\$15,855	4.7%
Non-operating adjustments (net of tax)			
Acquisition-related charges	\$41	495	29.5
Non-operating retirement-related costs/(income)	381	(32)	NM
Operating (non-GAAP) earnings*	\$17,627	\$16,318	8.0%
Diluted operating (non-GAAP) earnings per share	\$ 15.25	\$ 13.44	13.5%

NM—Not meaningful

* See page 35 for a more detailed reconciliation of net income to operating earnings.

In 2012, the company reported revenue of \$104.5 billion, expanded gross, pre-tax and net income margins, and delivered diluted earnings per share growth of 10.0 percent as reported and 13.5 percent on an operating (non-GAAP) basis. This was the 10th consecutive year of double-digit earnings per share growth for the company. The company generated \$19.6 billion in cash from operations, and \$18.2 billion in free cash flow driving shareholder returns of \$15.8 billion in gross common stock repurchases and dividends. The free cash flow performance in 2012 was \$12.3 billion greater than the company generated in 2002. The financial results demonstrate the strength and flexibility of the company's

business model, which is designed to deliver profit and cash on a sustained basis.

The company continued to deliver value to its clients and capitalize on key trends in 2012. The company had strong performance in business analytics, cloud and Smarter Planet—key growth initiatives that leverage the software portfolio and contribute to margin expansion. Within the growth markets, the company continued to expand its capabilities and build out IT infrastructures in emerging markets. In 2012, the growth markets revenue growth rate at constant currency outpaced the major markets by 8 points. The company continues to invest for innovation and technological leadership. These investments supported the introduction of the new System z mainframe, storage and POWER7+ products in hardware, as well as a series of major launches across software that included more than 400 new or upgraded product announcements. The introduction of PureSystems, a new category of expert integrated systems, brings together hardware and software and provides built-in expertise to deliver a more efficient and effective solution to the company's clients. In addition, the company was awarded more U.S. patents in 2012 than any other company for the 20th consecutive year, with many of the patents this year in key areas such as business analytics, Big Data, cybersecurity, cloud, mobile, social networking and software-defined environments. The company also continued to add to its capabilities to support the growth initiatives by acquiring 11 companies in 2012—investing approximately \$4 billion. At the same time, the company divested its Retail Store Solutions (RSS) business as it focused the Smarter Commerce portfolio on higher value, intellectual property-based opportunities. Throughout the year, the company continued the transformation of the business—shifting to higher value areas and improving its structure—resulting in a higher quality revenue stream and margin expansion.

Segment performance was led by Software which increased revenue 2.0 percent (4 percent adjusted for currency) driven by key branded middleware which increased 2.9 percent (5 percent adjusted for currency). Global Services revenue decreased 2.3 percent as reported, but was up 0.4 percent on a constant currency basis. Global Services revenue performance was led by the growth markets which were up 4.8 percent (9 percent adjusted for currency) and now represents more than 20 percent of total Global Services revenue. Systems and Technology revenue decreased 6.9 percent; adjusting for the divested RSS business, revenue declined 5.1 percent (4 percent adjusted for currency). The company's new mainframe was well received in the market, with System z revenue increasing 5.4 percent (6 percent adjusted for currency) versus the prior year. Global Financing revenue decreased 4.2 percent as reported, 1 percent on a constant currency basis, compared to the prior year.

Across all of the segments, the company continued to have strong performance in its key growth initiatives. These are not stand-alone offerings; they are integrated into the overall client offerings and are included in the financial results of the segments. In the growth markets, revenue increased 4.2 percent (7 percent adjusted for currency) year to year and represented 24 percent of total geographic revenue, an increase of 8 points since 2006. The company has been successful in capturing the opportunity in these faster growing markets. The company's business analytics initiative continues to expand. The company has made significant strides and expanded its leadership in a number of strategic areas

including Risk Management, Price and Promotion Optimization and Sales Performance Management. The value proposition in business analytics uniquely leverages the integration between the software portfolio and the Global Business Services (GBS) consulting expertise. In 2012, business analytics revenue increased 13 percent compared to the prior year, led by the GBS consulting practice. Within cloud computing, the company's SmartCloud portfolio addresses the full scope of enterprise client requirements. In 2012, the company continued to see strong demand for the foundational offerings in hardware and software that help clients build and run their private clouds, as well as for cloud-based solutions, like the company's Software as a Service (SaaS) offerings. With strong global growth, cloud revenue for 2012 increased 80 percent compared to the prior year. The Smarter Planet growth initiative expanded significantly in the past year—measured in terms of offerings, markets, clients and revenue performance. Clients are leveraging the company's growing capabilities in areas like: Smarter Commerce, Social Business and Smarter Cities, and in next generation systems, like Watson, which are helping clients with their complex challenges. For the year, Smarter Planet solutions generated revenue growth of over 25 percent versus the prior year. Overall, within the offerings in business analytics, cloud and Smarter Planet, approximately half of the revenue is software. Therefore, as these offerings become a larger percentage of total revenue, they are driving the higher quality revenue stream and improved mix and margins.

The consolidated gross profit margin increased 1.2 points versus 2011 to 48.1 percent. This was the ninth consecutive year of improvement in the gross profit margin. The operating (non-GAAP) gross margin of 48.7 percent increased 1.5 points compared to the prior year. The increase in gross margin in 2012 was driven by margin improvements in Software and both Global Services segments, and an improved revenue mix driven by Software.

Total expense and other income decreased 2.5 percent in 2012 versus the prior year. Total operating (non-GAAP) expense and other income decreased 3.9 percent compared to the prior year. The year-to-year drivers were approximately:

	Total Consolidated	Operating (non-GAAP)
• Currency*	(5) points	(5) points
• Acquisitions**	3 points	2 points
• Base expense	(0) points	(2) points

* Reflects impacts of translation and hedging programs.

** Includes acquisitions completed in prior 12-month period.

Pre-tax income grew 4.3 percent and the pre-tax margin was 21.0 percent, an increase of 1.3 points versus 2011. Net income increased 4.7 percent and the net income margin was 15.9 percent, an increase of 1.1 points versus 2011. The effective tax rate for 2012 was 24.2 percent compared with 24.5 percent in the prior year. Operating (non-GAAP) pre-tax income grew 7.3 percent and the operating (non-GAAP) pre-tax margin was 22.2 percent, an increase of 2.0 points versus the prior year. Operating (non-GAAP) net income increased 8.0 percent and the operating (non-GAAP) net income margin of 16.9 percent increased 1.6 points versus the prior year.

The operating (non-GAAP) effective tax rate was 24.0 percent versus 24.5 percent in 2011.

Diluted earnings per share improved 10.0 percent year to year reflecting the growth in net income and the benefits of the common stock repurchase program. In 2012, the company repurchased approximately 61 million shares of its common stock. Diluted earnings per share of \$14.37 increased \$1.31 from the prior year. Operating (non-GAAP) diluted earnings per share of \$15.25 increased \$1.81 versus 2011 driven by the following factors:

- Revenue decrease at actual rates \$(0.30)
- Margin expansion \$ 1.38
- Common stock repurchases \$ 0.73

At December 31, 2012, the company's balance sheet and liquidity positions remained strong and were well positioned to support the company's objectives. Cash and marketable securities at year end was \$11,128 million. Key drivers in the balance sheet and total cash flows are highlighted below.

Total assets increased \$2,780 million (\$3,242 million adjusted for currency) from December 31, 2011 driven by:

- Increases in total receivables (\$3,053 million), goodwill (\$3,034 million), marketable securities (\$717 million) and intangible assets (\$395 million), partially offset by
- Decreases in prepaid pension assets (\$1,899 million), cash and cash equivalents (\$1,511 million) and prepaid expenses and other current assets (\$1,224 million).

Total liabilities increased \$4,032 million (\$4,511 million adjusted for currency) from December 31, 2011 driven by:

- Increased retirement and nonpension postretirement benefit obligations (\$2,044 million), total debt (\$1,949 million), taxes (\$1,635 million) and total deferred income (\$399 million), partially offset by
- Decreases in other liabilities (\$1,389 million) and accounts payable (\$565 million).

Total equity of \$18,984 million decreased \$1,252 million from December 31, 2011 as a result of:

- Increased treasury stock (\$12,168 million) driven by share repurchases and increased losses in accumulated other comprehensive income/(loss) of (\$3,874 million) driven by pension remeasurements, partially offset by
- Higher retained earnings (\$12,783 million) and common stock (\$1,980 million).

The company generated \$19,586 million in cash flow provided by operating activities, a decrease of \$260 million when compared to 2011, primarily driven by a decrease in cash due to receivables (\$1,290 million) and an increased use of cash for accounts payable (\$675 million), partially offset by a decrease in net taxes paid (\$999 million) and the increase in net income (\$749 million). Net cash used in investing activities of \$9,004 million was \$4,608 million higher than 2011, primarily due to an increase in cash used of \$2,719 million associated with net purchases and sales of marketable securities

and other investments, increased cash used for acquisitions (\$1,911 million) and increased net capital investments (\$248 million), partially offset by increased cash from divestitures (\$585 million). Net cash used in financing activities of \$11,976 million was \$1,719 million lower, compared to 2011, primarily due to lower cash used for common stock repurchases (\$3,051 million), partially offset by lower cash provided by common stock transactions (\$914 million) and increased dividend payments (\$300 million).

In January 2013, the company disclosed that it is expecting GAAP earnings of at least \$15.53 and operating (non-GAAP) earnings of at least \$16.70 per diluted share for the full year 2013.

For additional information and details, see the "Year in Review" section on [pages 26 through 43](#). For additional information regarding 2012 free cash flow, see the company's Form 8-K filed with the SEC on January 22, 2013.

Description of Business

Please refer to IBM's Annual Report on Form 10-K filed with the SEC on February 26, 2013 for a more detailed version of this Description of Business, especially Item 1A, entitled "Risk Factors."

The company creates business value for clients and solves business problems through integrated solutions that leverage information technology and deep knowledge of business processes. IBM solutions typically create value by reducing a client's operational costs or by enabling new capabilities that generate revenue. These solutions draw from an industry-leading portfolio of consulting, delivery and implementation services, enterprise software, systems and financing.

Strategy

Despite the volatility of the information technology (IT) industry over the past decade, IBM has consistently delivered strong performance, with a steady track record of sustained earnings per share growth and cash generation. The company has shifted its business mix, exiting certain segments while increasing its presence in higher-value areas such as services, software and integrated solutions. As part of this shift, the company has acquired more than 140 companies since 2000, complementing and scaling its portfolio of products and offerings.

IBM's strategy of delivering high value solutions to enterprise clients has yielded consistent business results. Working with enterprise clients across the full spectrum of their business and technical opportunities, IBM delivers leadership innovation in technology, high value solutions and insights that improve client and industry outcomes. A highly engaged, global workforce with deep technical and business skills, teamed with an unmatched ecosystem of partners provides a world-class client experience.

These priorities reflect a broad shift in client spending toward innovation and efficiency, as companies seek higher levels of business value from their IT investments. IBM has been able to deliver this enhanced client value thanks to its industry expertise, understanding of clients' businesses, sustained investment in core and applied research and development (R&D), global reach and the breadth and depth of the company's capabilities.

New types of solutions, new market opportunities and new decision makers are emerging as clients look to make use of technology to generate innovation and competitive advantage. These opportunities are driven by a new era of computing that is enabled by analytics, cloud computing, Big Data, mobility, social computing and supported by enterprise grade security solutions. The company's strategy is to establish leadership in this new era of smarter computing—computing that is designed for Big Data, built on software-defined environments and open—in order to enhance the value we deliver, create new markets and engage new clients.

To capture the opportunities arising from these market trends, IBM is focused on four key growth initiatives: Smarter Planet, Growth Markets, Business Analytics and Optimization and Cloud Computing. Each initiative represents a significant growth opportunity with attractive profit margins for IBM.

Smarter Planet

Smarter Planet is IBM's vision of a technology-enabled world that is more instrumented, interconnected and intelligent than ever before, enabling people and organizations to tackle significant business and societal challenges. At the heart of this vision is the opportunity for meaningful innovation—exploring and extending the boundaries of businesses, industries and communities. It's about helping the company's clients become better at what they do for their clients. IBM's strategy is to accelerate progress toward a "smarter planet" by equipping clients with the advanced, integrated capabilities they need to thrive in this exciting new world that is unfolding before us—capabilities such as analytics for business and physical systems, business process management, social business, mobile computing and cloud computing.

IBM has continued to deepen its commitment to understanding and delivering on the promise of Smarter Planet for both line of business and IT executives across a broad range of industries. An industry-based approach is central to the strategy, since every industry confronts a distinct set of challenges and opportunities in today's constantly transforming world. Whether "smarter" means helping a hospital group to deliver improved healthcare, a local government to ease traffic congestion, or a retail chain to execute a successful cross-channel campaign, IBM is aggressively developing and investing in a portfolio of industry solutions that helps these clients achieve their goals.

Three initiatives that drive significant value illustrate IBM's deep commitment to building a smarter planet: Smarter Commerce, Smarter Cities and Social Business. IBM's Smarter Commerce model integrates and transforms how companies manage and adapt their buy, market, sell and service processes, placing the customer squarely at the center of their business. IBM's Smarter Cities initiative enables federal, state and local governments to make smarter decisions, anticipate issues and coordinate resources more effectively, while delivering citizen-centric services that underpin sustainable economic growth. IBM's Social Business initiative helps clients integrate social technologies and practices into their front-end processes to more effectively create and share knowledge to accelerate innovation, improve customer service, and build a smarter workforce. Each of these initiatives is powered by market-leading IBM innovations and software, developed both by IBM and through acquisitions.

Growth Markets

The company has benefited from its investments over the past several years in the growth markets. The focus now is on geographic expansion of IBM's presence; on selected industries of the highest impact and opportunity; on countries' build-outs of infrastructure aligned with their national agendas; and, on creating markets and new business models to serve the different requirements that exist in these emerging countries. The company's effort in developing new growth markets within the African continent is a good example of this focus. Many of these initiatives are leading-edge, both in technologies and business models, and are delivering both increased revenue and margin expansion.

In order to support this growth, IBM continues to invest significantly in these markets to expand capacity, to develop talent and to deepen its R&D capabilities on the ground. At the same time, IBM continues to leverage talent across the growth markets under its globally integrated enterprise model to the benefit of both its clients and the company worldwide.

Business Analytics and Optimization

Business Analytics and Optimization (BAO) is the category of software, systems and services that help organizations take advantage of all the data available to them for better and faster decision making and process optimization. This includes data that is being labeled "Big Data," which is data of extreme volume, data being generated at a high velocity, and newer varieties of data like blogs, tweets, pictures, videos, unstructured text created by the explosion of social media websites and the instrumentation of nearly everything. BAO is core to achieving a smarter planet, helping leaders of this new information-centric and insight-driven world infuse intelligence into their business processes.

Smarter Analytics is IBM's unique offering for the BAO category. With Smarter Analytics and the company's deep expertise, IBM can help organizations: 1) grow, retain and satisfy customers through deep insight on individual customers and similar segments; 2) increase operational efficiency through, for example, supply chain optimization, predictive maintenance, fraud reduction and optimization of sales incentives and compensation; 3) transform their financial processes such as planning, budgeting, forecasting, financial consolidation, regulatory filing and financial reporting; and 4) better manage risk and regulatory compliance.

The company's approach to analytics is to ensure clients have complete end-to-end solutions across industries and functional focus areas like finance, sales, marketing, operations and risk. These solutions are designed to help organizations: 1) align around all their data—both traditional and big data—and establish a strong information foundation; 2) apply analytics to their data so they can anticipate and shape business outcomes, identify patterns and gain insights into future performance; 3) enable workers on the front lines who collectively make thousands and even millions of decisions daily with insight that is immediately actionable so they can make the best possible decision—decisions like what claims to fast track in an insurance call center, or what offer is the best for each individual customer who calls a call center; and 4) create a culture that takes action on analytics and that truly transforms.

IBM is committed to continually innovating across the spectrum of analytic capabilities, systems, research, services, deployment and skills. For example, in 2012, the game changing innovations in Watson were applied to Healthcare and Financial Services, analytic research like the ground-breaking work being done on temporal causal modeling and visualization, and investments in analytic skills and deployment ability in our new Analytics research centers in Columbus, Ohio and Halifax, Nova Scotia.

Cloud Computing

Cloud is a model for consuming and delivering business and IT services. It can deliver significant economies, enable new levels of speed, flexibility and agility and even serve as a transformative platform for business innovation. From a business perspective, cloud computing is reshaping industry ecosystems, invigorating product innovation and enabling new business models that leverage new sources of competitive differentiation. From an IT perspective, cloud offers improved access to and utilization of information technology through use of highly efficient virtualization and management technology, consumer-style user interfaces and ubiquitous connectivity, including via mobile technologies.

IBM has already helped thousands of its clients adopt and leverage cloud computing through its broad portfolio of IBM SmartCloud products, solutions and services. Organizations moving beyond initial exploration of cloud computing seek solutions that align with their specific needs. IBM's breadth of cloud capabilities gives it a unique ability to help clients exploit the advantages of cloud. IBM has cloud solutions that span infrastructure, platform, applications and business process services all geared to enable clients to drive significant business value through the rapid adoption and exploitation of new cloud capabilities. IBM's expert consulting, breakthrough technologies and a portfolio of cloud-based services are squarely focused on the requirements of the enterprise.

The company offers a full array of cloud delivery models, including private clouds, public clouds and a hybrid of both. IBM helps build out private, on-premises cloud-based environments that provide the control, security and isolation that clients require for their most mission-critical workloads. IBM public clouds provide infrastructure, platforms and applications as rapidly provisioned and highly-scalable cloud services on a pay-as-you-go basis. Hybrid clouds provide seamless integration across private and public cloud models, ensuring the interoperability, portability and scalability that clients need to realize the full value of cloud.

Business Model

The company's business model is built to support two principal goals: helping clients to become more innovative, efficient and competitive through the application of business insight and IT solutions; and providing long-term value to shareholders. The business model has been developed over time through strategic investments in capabilities and technologies that have superior long-term growth and profitability prospects based on the value they deliver to clients.

The company's global capabilities include services, software, systems, fundamental research and related financing. The broad mix of businesses and capabilities are combined to provide integrated solutions to the company's clients.

The business model is resilient, adapting to the continuously changing market and economic environment. The company continues to divest certain businesses and strengthen its position through strategic organic investments and acquisitions in higher-value segments like business analytics, Smarter Planet and cloud computing. In addition, the company has transformed itself into a globally integrated enterprise which has improved overall productivity and is driving investment and expanding participation in the world's fastest growing markets.

This business model, supported by the company's financial model, has enabled the company to deliver strong earnings, cash flows and returns to shareholders over the long term.

Business Segments and Capabilities

The company's major operations consists of five business segments: Global Technology Services and Global Business Services, which the company collectively calls Global Services, Software, Systems and Technology and Global Financing.

Global Services is a critical component of the company's strategy of providing IT infrastructure and business insight and solutions to clients. While solutions often include industry-leading IBM software and systems, other suppliers' products are also used if a client solution requires it. Approximately 60 percent of external Global Services segment revenue is annuity based, coming primarily from outsourcing and maintenance arrangements. The Global Services backlog provides a solid revenue base entering each year. Within Global Services, there are two reportable segments: Global Technology Services and Global Business Services.

Global Technology Services (GTS) primarily provides IT infrastructure and business process services, creating business value for clients through unique technology and IP integrated services within its global delivery model. By leveraging insights and experience drawn from IBM's global scale, skills and technology, with applied innovation from IBM Research, clients gain access to leading-edge, high-quality services with improved productivity, flexibility, cost and outcomes.

GTS Capabilities

Strategic Outsourcing Services: delivers comprehensive IT outsourcing services dedicated to transforming clients' existing infrastructures to consistently deliver improved quality, flexibility, risk management and financial value. The company integrates long-standing expertise in service management and technology with the ability to exploit the power of new technologies from IBM systems and software, such as cloud computing, analytics and virtualization, to deliver high performance, innovation and improved ability to achieve business objectives.

Global Process Services: delivers a range of offerings consisting of standardized through transformational solutions including processing platforms and business process outsourcing. These services deliver improved business results to clients through the strategic change and/or operation of the client's business processes, applications and infrastructure.

Integrated Technology Services: delivers a portfolio of project-based and managed services that enable clients to transform and

optimize their IT environments by driving efficiency, flexibility and productivity, while reducing costs. The standardized portfolio is built around key assets and patented software, and incorporates best practices and proven methodologies that ensure predictive quality of delivery, security and compliance.

Technology Support Services: delivers a complete line of support services from product maintenance through solution support to maintain and improve the availability of clients' IT infrastructures.

Global Business Services (GBS) has the mission to deliver predictable business outcomes to the company's clients across two primary business areas: Consulting and Application Management Services. These professional services deliver business value and innovation to clients through solutions which leverage industry and business process expertise. The role of GBS is to drive initiatives that integrate IBM content and solutions and drive the progress of the company's four primary growth initiatives.

As clients transform themselves in response to market trends like Big Data, social and mobile computing, GBS is aligning its expertise and capabilities to address two interdependent categories of opportunity: Front Office Digitization, which describes the markets forming around new models of engagement with all audiences; and the Globally Integrated Enterprise, which describes the mandate to integrate data and processes in support of the new front-office programs, and build far more flexible information applications.

GBS Capabilities

Consulting: delivering client value with solutions in Strategy and Transformation; Application Innovation Services; Enterprise Applications and Smarter Analytics. Consulting is also focused on bringing to market client solutions that drive Front Office Digitization in Smarter Commerce, Cloud, Mobile and Social Business.

Application Management Services: application management, maintenance and support services for packaged software, as well as custom and legacy applications. Value is delivered through advanced capabilities in areas such as application testing and modernization, cloud application services, the company's highly differentiated globally integrated capability model, industry knowledge and the standardization and automation of application management.

Software consists primarily of middleware and operating systems software. Middleware software enables clients to integrate systems, processes and applications across a standard software platform to improve their business results, solve critical problems and gain competitive advantage within their industries. IBM middleware is designed on open standards, making it easier to integrate disparate business applications, developed by different methods and implemented at different times. Operating systems are the software engines that run computers. Approximately two-thirds of external Software segment revenue is annuity based, coming from recurring license charges and ongoing post-contract support. The remaining one-third relates to one-time charge (OTC) arrangements in which clients pay one, up-front payment for a perpetual license. Typically, the sale of OTC software includes one year of post-contract support. Clients can also purchase ongoing post-contract support after the first year, which includes unspecified product upgrades and technical support.

Software Capabilities

WebSphere Software: delivers capabilities that enable organizations to run high-performance business applications. With these applications, clients can integrate and manage business processes across their organizations with the flexibility and agility they need to respond to changing conditions. Built on services-oriented architecture (SOA), and open standards support for cloud, mobile and social interactions, the WebSphere platform enables enterprises to extend their reach and optimize interactions with their key constituents. Smarter Commerce software helps companies better manage and improve each step of their value chain and capitalize on opportunities for profitable growth, efficiency and increased customer loyalty.

Information Management Software: enables clients to integrate, manage and analyze enormous amounts of data from a large variety of sources in order to gain competitive advantage and improve their business outcomes. With this approach, clients can extract real value out of their data and use it to make better business decisions. IBM's middleware and integrated solutions include advanced database management, information integration, data governance, enterprise content management, data warehousing, business analytics and intelligence, predictive analytics and big data analytics.

Tivoli Software: helps clients optimize the value they get from their infrastructures and technology assets through greater visibility, control and automation across their end-to-end business operations. These asset management solutions foster integrated service delivery for cloud and datacenter management, enterprise endpoint and mobile device management, asset and facilities management, and storage management. Tivoli includes security systems software that provides clients with a single security intelligence platform that enables them to better secure all aspects of their enterprise and prevent security breaches.

Lotus Software: enables businesses to connect people and processes for more effective communication and increased productivity through collaboration, messaging and social networking software. By remaining at the forefront of collaboration tools, IBM's social business offerings help organizations reap real benefits associated with social networking, as well as create a more efficient and effective workforce.

Rational Software: supports software development for both IT, as well as complex and embedded system solutions, with a suite of Collaborative Lifecycle Management products. Jazz, Rational's technology platform, transforms the way people work together to build software, making software delivery more integrated and collaborative, while optimizing for successful business outcomes.

Operating Systems: software that manages the fundamental processes that make computers run.

Systems and Technology (STG) provides clients with business solutions requiring advanced computing power and storage capabilities. Approximately half of Systems and Technology's server and storage sales transactions are through the company's business partners; with the balance direct to end-user clients. In addition, Systems and Technology provides leading semiconductor technology, products and packaging solutions for IBM's own advanced technology needs and for external clients.

Systems and Technology Capabilities

Systems: a range of general purpose and integrated systems designed and optimized for specific business, public and scientific computing needs. These systems—System z, Power Systems and System x—are typically the core technology in data centers that provide required infrastructure for business and institutions. Also, these systems form the foundation for IBM's integrated offerings, such as IBM PureSystems, IBM Smart Analytics, IBM Netezza, IBM SmartCloud Entry and IBM BladeCenter for Cloud. IBM servers use both IBM and non-IBM microprocessor technology and operating systems. All IBM servers run Linux, a key open-source operating system.

Storage: data storage products and solutions that allow clients to retain and manage rapidly growing, complex volumes of digital information. These solutions address critical client requirements for information retention and archiving, security, compliance and storage optimization including data deduplication, availability and virtualization. The portfolio consists of a broad range of disk and tape storage systems and software.

Microelectronics: semiconductor design and manufacturing primarily for use in IBM systems and storage products as well as delivering semiconductors and related services to external clients.

Global Financing facilitates clients' acquisition of IBM systems, software and services. Global Financing invests in financing assets, leverages with debt and manages the associated risks with the objective of generating consistently strong returns on equity. The primary focus on the company's offerings and clients mitigates many of the risks normally associated with a financing company. Global Financing has the benefit of both a deep knowledge of its client base and a clear insight into the products and services that are being financed. This combination allows Global Financing to effectively manage two of the major risks (credit and residual value) that are normally associated with financing.

Global Financing Capabilities

Client Financing: lease and loan financing to end users and internal clients for terms generally between one and seven years. Internal financing is predominantly in support of Global Services' long-term client service contracts. Global Financing also factors a selected portion of the company's accounts receivable, primarily for cash management purposes. All internal financing arrangements are at arm's-length rates and are based upon market conditions.

Commercial Financing: short-term inventory and accounts receivable financing to dealers and remarketers of IT products.

Remanufacturing and Remarketing: as equipment is returned at the conclusion of a lease transaction, these assets are refurbished and sold or leased to new or existing clients both externally and internally. Externally remarketed equipment revenue represents sales or leases to clients and resellers. Internally remarketed equipment revenue primarily represents used equipment that is sold internally to Systems and Technology and Global Services. Systems and Technology may also sell the equipment that it purchases from Global Financing to external clients.

IBM Worldwide Organizations

The following worldwide organizations play key roles in IBM's delivery of value to its clients:

- Sales and Distribution
- Research, Development and Intellectual Property
- Enterprise Transformation
- Integrated Supply Chain

Sales and Distribution

IBM has a significant global presence, operating in more than 170 countries, with an increasingly broad-based geographic distribution of revenue. The company's Sales and Distribution organization manages a strong global footprint, with dedicated country-based operating units focused on delivering client value. Within these units, client relationship professionals work with integrated teams of consultants, product specialists and delivery fulfillment teams to improve clients' business performance. These teams deliver value by understanding the clients' businesses and needs, and then bring together capabilities from across IBM and an extensive network of Business Partners to develop and implement solutions.

By combining global expertise with local experience, IBM's geographic structure enables dedicated management focus for local clients, speed in addressing new market opportunities and timely investments in emerging opportunities. The geographic units align industry-skilled resources to serve clients' agendas. IBM extends capabilities to mid-market client segments by leveraging industry skills with marketing, Inside Sales and local Business Partner resources.

Through its growth markets organization, the company continues to increase its focus on the emerging markets around the world that have market growth rates greater than the global average—countries within Southeast Asia, Eastern Europe, the Middle East and Latin America. The company's major markets include the G7 countries of Canada, France, Germany, Italy, Japan, the United States (U.S.) and the United Kingdom (UK) plus Austria, the Bahamas, Belgium, the Caribbean region, Cyprus, Denmark, Finland, Greece, Iceland, Ireland, Israel, Malta, the Netherlands, Norway, Portugal, Spain, Sweden and Switzerland.

The majority of IBM's revenue, excluding the company's original equipment manufacturer (OEM) technology business, occurs in industries that are broadly grouped into six sectors:

- Financial Services: Banking, Financial Markets, Insurance
- Public: Education, Government, Healthcare, Life Sciences
- Industrial: Aerospace and Defense, Automotive, Chemical and Petroleum, Electronics
- Distribution: Consumer Products, Retail, Travel and Transportation
- Communications: Telecommunications, Media and Entertainment, Energy and Utilities
- General Business: Cross-sector representation of intermediate-sized large enterprises as well as mid-market clients (less than 1,000 employees)

Research, Development and Intellectual Property

IBM's R&D operations differentiate the company from its competitors. IBM annually invests over \$6 billion for R&D, focusing on high-growth, high-value opportunities.

IBM Research works with clients and the company's business units through 12 global labs on near-term and mid-term innovations. It contributes many new technologies to IBM's portfolio every year and helps clients address their most difficult challenges. IBM Research also explores the boundaries of science and technology—from nanotechnology, to future systems, to big data analytics, to secure clouds, to IBM Watson, a "cognitive" learning system that applied advanced analytics to defeat the all-time champions on the television quiz show, *Jeopardy!*. The Watson system is being introduced to the market for advanced healthcare applications and is being further developed and extended within healthcare and in other industries.

IBM Research also focuses on differentiating IBM's services businesses providing new capabilities and solutions. It has the world's largest mathematics department of any public company, enabling IBM to create unique analytic solutions and actively engage with clients on their toughest challenges.

In 2012, IBM was awarded more U.S. patents than any other company for the 20th consecutive year. IBM's 6,478 patents in 2012 included inventions that will enable fundamental advancements in analytics, big data, cybersecurity, cloud, mobile, social networking and software defined environments, as well as industry solutions for retail, banking, healthcare and transportation. It was the most U.S. patents ever awarded to one company in a single year.

The company continues to actively seek intellectual property protection for its innovations, while increasing emphasis on other initiatives designed to leverage its intellectual property leadership. Some of IBM's technological breakthroughs are used exclusively in IBM products, while others are licensed and may be used in either/both IBM products and/or the products of the licensee. While the company's various proprietary intellectual property rights are important to its success, IBM believes its business as a whole is not materially dependent on any particular patent or license, or any particular group of patents or licenses. IBM owns or is licensed under a number of patents, which vary in duration, relating to its products.

Enterprise Transformation

A key element of the company's strategy has been focused on becoming the premier globally integrated enterprise. The company has implemented a consistent set of processes and standards worldwide to reduce inefficiencies and improve collaboration. With its processes fully standardized, the company implemented a new operating model with work shared in global resource centers of excellence located where it made the most business sense. The company has shifted resources toward building client relationships and employee skills, while positioning the company for new market opportunities. During this transformation, IBM pioneered this new operating model, changing from a classic "multinational," with smaller versions of the parent company replicated in countries around the world, to a global model with one set of processes, shared services and broadly distributed decision making.

The company has now embarked on the next generation of its transformation in which new capabilities and technologies like business analytics and cloud computing will drive performance. The proven principles of the globally integrated enterprise will be applied to all of the company's spending to continue to drive additional productivity benefits in shared services, end-to-end process transformation and integrated operations. The company primarily reinvests the benefits of its enterprise transformation initiatives in remixing its spending profile and resources to the higher growth, higher margin initiatives such as business analytics, Smarter Planet and cloud computing, in addition to improving profitability.

Integrated Supply Chain

IBM spends approximately \$35 billion annually through its supply chain, procuring materials and services globally. In addition, in 2012, the company managed approximately \$20 billion in procurement spending for its clients through the Global Process Services organization. The supply, manufacturing, and logistics and customer fulfillment operations are integrated in one operating unit that has

optimized inventories over time. Simplifying and streamlining internal processes has improved sales force productivity and operational effectiveness and efficiency. Continuous improvements to supply chain resiliency against marketplace changes and risks have been particularly valuable in maintaining continuity during natural disasters and other disruptive events.

The company's continuing efforts to derive business value from its own globally integrated supply chain provides a strategic advantage for the company to create value for clients. IBM leverages its supply chain expertise for clients through its supply chain business transformation outsourcing service to optimize and help operate clients' end-to-end supply chain processes, from procurement to logistics.

Increasingly the company is using analytics to measure, manage and fine tune its supply chain operations, which will help to reshape its operations and create value for clients. The goal is to continue to increase the use of analytics in the five major areas of supply chain: 1) Supply Chain Visibility, 2) Risk Management, 3) Customer Insight, 4) Cost Containment, and 5) Global Supply Chain and Sustainability.

Year in Review

Segment Details

The following is an analysis of the 2012 versus 2011 reportable segment results. The table below presents each reportable segment's external revenue and gross margin results.

(\$ in millions)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent/ Margin Change	Yr.-to-Yr. Percent Change Adjusted for Currency
Revenue				
Global Technology Services	\$ 40,236	\$ 40,879	(1.6)%	1.3%
Gross margin	36.6%	35.0%	1.6 pts.	
Global Business Services	18,566	19,284	(3.7)%	(1.6)%
Gross margin	30.0%	28.8%	1.2 pts.	
Software	25,448	24,944	2.0%	4.3%
Gross margin	88.7%	88.5%	0.2 pts.	
Systems and Technology	17,667	18,985	(6.9)%	(5.9)%
Gross margin	39.1%	39.8%	(0.7) pts.	
Global Financing	2,013	2,102	(4.2)%	(1.2)%
Gross margin	46.5%	49.8%	(3.3) pts.	
Other	577	722	(20.1)%	(18.7)%
Gross margin	(71.6)%	(54.5)%	(17.1) pts.	
Total consolidated revenue	\$104,507	\$106,916	(2.3)%	0.0%
Total consolidated gross profit	\$ 50,298	\$ 50,138	0.3%	
Total consolidated gross margin	48.1%	46.9%	1.2 pts.	
Non-operating adjustments				
Amortization of acquired intangible assets	375	340	10.3%	
Acquisition-related charges	1	1	13.1	
Retirement-related costs/(income)	264	2	NM	
Operating (non-GAAP) gross profit	\$ 50,938	\$ 50,481	0.9%	
Operating (non-GAAP) gross margin	48.7%	47.2%	1.5 pts.	

NM—Not meaningful

The following table presents each reportable segment's external revenue as a percentage of total segment external revenue and each reportable segment's pre-tax income as a percentage of total segment pre-tax income.

	Revenue		Pre-tax Income*	
	2012	2011	2012	2011
For the year ended December 31:				
Global Technology Services	38.7%	38.5%	29.0%	27.4%
Global Business Services	17.9	18.2	12.4	13.1
Total Global Services	56.6	56.7	41.4	40.6
Software	24.5	23.5	45.0	43.5
Systems and Technology	17.0	17.9	5.1	7.1
Global Financing	1.9	2.0	8.5	8.8
Total	100.0%	100.0%	100.0%	100.0%

*Segment pre-tax income includes transactions between segments that are intended to reflect an arm's-length transfer price and excludes certain unallocated corporate items; see note T, "Segment Information," on [pages 134 to 138](#) for additional information.

Global Services

In 2012, the Global Services segments, Global Technology Services (GTS) and Global Business Services (GBS), delivered revenue of \$58,802 million, grew pre-tax profit 7 percent and expanded pre-tax margin 1.5 points on an as-reported basis. Revenue performance was led by strength in the growth markets which were up 4.8 percent (9 percent adjusted for currency) and now represents over 20 percent of total Global Services revenue. Revenue from the major markets

declined 4.0 percent (2 percent adjusted for currency) year to year. The services segments also had strength in all the key growth initiatives, which are becoming a larger part of the services business as the company continues to shift toward higher value content. Total outsourcing revenue of \$27,552 million decreased 2.6 percent (flat adjusted for currency) and total transactional revenue of \$23,907 million decreased 1.8 percent (flat adjusted for currency) year to year.

(\$ in millions)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent Change Adjusted for Currency	
			Yr.-to-Yr. Percent Change	Yr.-to-Yr. Percent Change Adjusted for Currency
Global Services external revenue	\$58,802	\$60,163	(2.3)%	0.4%
Global Technology Services	\$40,236	\$40,879	(1.6)%	1.3%
Outsourcing	23,344	23,911	(2.4)	0.5
Integrated Technology Services	9,550	9,453	1.0	3.7
Maintenance	7,343	7,515	(2.3)	0.6
Global Business Services	\$18,566	\$19,284	(3.7)%	(1.6)%
Outsourcing	4,209	4,390	(4.1)	(1.7)
Consulting and Systems Integration	14,358	14,895	(3.6)	(1.6)

Global Technology Services revenue of \$40,236 million in 2012 decreased 1.6 percent as reported, but increased 1 percent adjusted for currency year to year. Revenue growth from the backlog was partially offset by a decline in revenue from new signings and a decrease in sales in existing accounts. Revenue performance was led by the growth markets which were up 5.0 percent (9 percent adjusted for currency). GTS Outsourcing revenue decreased 2.4 percent as reported, but increased 1 percent adjusted for currency in 2012. Outsourcing revenue from the growth markets increased 2.4 percent (7 percent adjusted for currency), as the outsourcing offerings help clients build out their IT infrastructures. Integrated Technology Services (ITS) revenue increased 1.0 percent (4 percent adjusted for currency) in 2012 compared to 2011, and continued to be led by strength in the growth markets which increased 10.3 percent (13 percent adjusted for currency).

Global Business Services revenue of \$18,566 million decreased 3.7 percent (2 percent adjusted for currency) in 2012. On a geographic basis, solid performance in the growth markets, with revenue up 4.3 percent (8 percent adjusted for currency), was offset by a 5.1 percent decline (3 percent adjusted for currency) in the major markets. The growth initiatives—business analytics, Smarter Planet and cloud had solid double-digit revenue growth, and represented over one-third of total GBS revenue in 2012. As GBS shifts more of its business to higher value content, these larger, more complex engagements are having a positive effect on the GBS backlog. The GBS backlog grew for the fourth consecutive year at constant currency—although the backlog is mixing to longer duration engagements. Application Outsourcing revenue decreased 4.1 percent (2 percent adjusted for currency) in 2012 year to year, and Consulting and Systems Integration (C&SI) revenue decreased 3.6 percent (2 percent adjusted for currency). Both GBS lines of business had solid revenue performance year to year in the growth markets with Application Outsourcing and C&SI up 1.5 percent and 5.3 percent, respectively, as reported, and up 6 percent and 8 percent, respectively, at constant currency.

(\$ in millions)

For the year ended December 31:	2012	2011	Yr.-to-Yr Percent/ Margin Change
Global Services			
Global Technology Services			
External gross profit	\$14,740	\$14,320	2.9%
External gross profit margin	36.8%	35.0%	1.6 pts.
Pre-tax income	\$ 6,961	\$ 6,284	10.8%
Pre-tax margin	16.8%	14.9%	1.9 pts.
Global Business Services			
External gross profit	\$ 5,564	\$ 5,545	0.3%
External gross profit margin	30.0%	28.8%	1.2 pts.
Pre-tax income	\$ 2,983	\$ 3,006	(0.8)%
Pre-tax margin	15.5%	15.0%	0.5 pts.

GTS gross profit increased 2.9 percent in 2012 and the gross profit margin improved 1.6 points year to year with margin expansion in each line of business, led by Outsourcing. Pre-tax income of

\$6,961 million in 2012 increased 10.8 percent year to year and the pre-tax margin expanded 1.9 points to 16.8 percent. Normalized for workforce rebalancing charges of \$151 million and \$5 million in the third quarter of 2012 and 2011, respectively, GTS pre-tax income was up 13.1 percent and pre-tax margin expanded 2.2 points. The year-over-year gross and pre-tax margin expansion was driven by several factors: the work done to improve the profitability of a number of low margin contracts in the outsourcing portfolio, increased contribution from the higher margin growth markets, and increased efficiency and productivity from the focus on automation and process primarily through the company's enterprise productivity initiatives.

The GBS gross profit margin expanded 1.2 points, led primarily by improved profit performance in Application Outsourcing. GBS pre-tax income of \$2,983 million declined 0.8 percent in 2012 with a pre-tax margin of 15.5 percent, an improvement of 0.5 points year to year. Normalized for workforce rebalancing charges of \$113 million and \$5 million in the third quarter of 2012 and 2011, respectively, GBS pre-tax income was up 2.8 percent and the pre-tax margin expanded 1.1 points. The gross and pre-tax margins benefitted from improved service delivery and yield from the company's enterprise productivity initiatives.

The total Global Services business delivered strong profit and margin expansion throughout 2012. Pre-tax income of \$9,944 million in 2012 increased 7.0 percent year to year. Normalized for the higher level of workforce rebalancing charges in 2012, pre-tax income was up 9.8 percent and the pre-tax margin expanded 1.9 points compared to the prior year.

Global Services Backlog

The estimated Global Services backlog at December 31, 2012 was \$140 billion, a decrease of 0.3 percent as reported, but an increase of 1 percent adjusted for currency compared to the December 31, 2011 balance, and an increase of 1.9 percent (3 percent adjusted for currency) compared to the September 30, 2012 balance. Revenue generated from the backlog is approximately 70 percent of total services annual revenue in any year, with the remainder coming from transactional signings in the year, and sales and volumes into the existing client base. In 2013, the projected total services revenue from the backlog is expected to be up 1 percent year to year at consistent foreign currency exchange rates. This includes 2 percent growth from the run out of the opening backlog and a 1 percent impact from the work done to restructure a number of lower margin contracts in the outsourcing business. Despite the impact to revenue growth, these restructured contracts have improved the profitability of the backlog. These contracts provided year-to-year profit improvement in 2012. This impact, which will carryforward to 2013, will contribute modest profit growth in 2013 off this higher profit base, with the gross profit coming from the backlog more representative of a 2 percent backlog growth versus a 1 percent growth.

The total estimated growth markets backlog at December 31, 2012 increased 13.6 percent (15 percent adjusted for currency) year to year. The estimated transactional backlog at December 31, 2012 increased 8.7 percent (9 percent adjusted for currency) and the estimated outsourcing backlog decreased 3.3 percent (2 percent adjusted for currency), respectively, from the December 31, 2011 levels.

(\$ in billions)

	2012	2011	Yr.-to-Yr. Percent Change	Yr.-to-Yr. Percent Change Adjusted for Currency
At December 31:				
Backlog				
Total backlog	\$140.3	\$140.6	(0.3)%	0.6%
Outsourcing backlog	89.4	92.5	(3.3)	(2.4)

Total Global Services backlog includes GTS Outsourcing, ITS, GBS Outsourcing, Consulting and Systems Integration and Maintenance. Outsourcing backlog includes GTS Outsourcing and GBS Outsourcing. Transactional backlog includes ITS and Consulting and Systems Integration. Total backlog is intended to be a statement of overall work under contract and therefore does include Maintenance. Backlog estimates are subject to change and are affected by several factors, including terminations, changes in the scope of contracts, periodic revalidations, adjustments for revenue not materialized and adjustments for currency.

Global Services signings are management's initial estimate of the value of a client's commitment under a Global Services contract. There are no third-party standards or requirements governing the calculation of signings. The calculation used by management involves

estimates and judgments to gauge the extent of a client's commitment, including the type and duration of the agreement, and the presence of termination charges or wind-down costs.

Signings include GTS Outsourcing, ITS, GBS Outsourcing and Consulting and Systems Integration contracts. Contract extensions and increases in scope are treated as signings only to the extent of the incremental new value. Maintenance is not included in signings as maintenance contracts tend to be more steady state, where revenues equal renewals.

Contract portfolios purchased in an acquisition are treated as positive backlog adjustments provided those contracts meet the company's requirements for initial signings. A new signing will be recognized if a new services agreement is signed incidental or coincidental to an acquisition or divestiture.

(\$ in millions)

	2012	2011	Yr.-to-Yr. Percent Change	Yr.-to-Yr. Percent Change Adjusted for Currency
For the year ended December 31:				
Total signings	\$56,595	\$57,435	(1.5)%	1.1%
Outsourcing signings	\$27,891	\$29,251	(4.6)%	(1.9)%
Transactional signings	28,703	28,184	1.8	4.1

Software

(\$ in millions)

	2012	2011*	Yr.-to-Yr. Percent Change	Yr.-to-Yr. Percent Change Adjusted for Currency
For the year ended December 31:				
Software external revenue	\$25,448	\$24,944	2.0%	4.3%
Middleware	\$20,983	\$20,650	1.6%	3.9%
Key Branded Middleware	16,528	16,055	2.9	5.2
WebSphere Family			7.8	9.9
Information Management			1.5	3.8
Lotus			(2.1)	0.3
Tivoli			4.1	6.2
Rational			(1.6)	0.6
Other middleware	4,455	4,596	(3.1)	(0.6)
Operating systems	2,525	2,480	1.8	4.3
Other	1,940	1,813	7.0	9.2

*Reclassified to conform with 2012 presentation.

Software revenue of \$25,448 million increased 2.0 percent (4 percent adjusted for currency) in 2012 compared to 2011. Software revenue growth continued to be led by the key branded middleware products with constant currency growth in all the brands, and particular

strength and share gains in WebSphere and Tivoli. Software continued its momentum throughout 2012 in the growth initiatives with strong performance in business analytics, Smarter Commerce and cloud. The Software business delivered \$10.8 billion in segment

pre-tax profit, an increase of \$840 million from 2011. The results reflect the company's sustained investment in strategic branded software. In addition to organic investments, acquisitions have provided additional capabilities, while leveraging the existing portfolio of offerings. The software business completed nine acquisitions in 2012, further increasing the company's capabilities in analytics, cloud and Smarter Planet.

Key branded middleware revenue increased 2.9 percent (5 percent adjusted for currency) and again gained market share in 2012, as the Software business continued to be the leader in the middleware market. Revenue continued to mix to the faster growing and higher value branded middleware products which accounted for 65 percent of total software revenue in 2012, an increase of 1 point from 2011.

WebSphere revenue increased 7.8 percent (10 percent adjusted for currency) in 2012, with strong performance throughout the year, and gained share. Revenue performance included strong growth in the core offerings of commerce and application servers. Commerce revenue increased 14 percent (15 percent adjusted for currency) and application server products increased 6 percent (8 percent adjusted for currency). The company further strengthened its WebSphere portfolio during the year with the acquisitions of Worklight, DemandTec, Emptoris and Tealeaf.

Information Management revenue increased 1.5 percent (4 percent adjusted for currency) in 2012 compared to 2011. Performance was led by growth in the business analytics offerings. The acquisitions of Varicent and Vivisimo expanded the Business Analytics and Optimization software capabilities. Varicent's analytics software helps clients optimize sales performance management. Vivisimo expands the breadth of the company's big data capabilities and creates the most complete end-to-end big data solution for clients.

Tivoli revenue increased 4.1 percent (6 percent adjusted for currency) in 2012, led by its storage and security offerings, and gained share. Tivoli storage revenue was up 12 percent (14 percent adjusted for currency) in 2012, with double-digit constant currency growth in each quarter, reflecting the value of storage software. Tivoli security revenue increased 8 percent (10 percent adjusted for currency), with

strong contribution from Q1 Labs which provides next generation security intelligence.

Lotus revenue decreased 2.1 percent as reported, but was flat year to year at constant currency in 2012. The social business offerings performed well, including contribution from the acquisition of Kenexa, a leading provider of recruiting and talent management solutions.

Rational revenue decreased 1.6 percent as reported, but increased 1 percent at constant currency in 2012 year over year, and held share.

Operating systems revenue increased 1.8 percent (4 percent adjusted for currency) in 2012 compared to 2011, driven by Platform Computing which provides cluster and grid management software for distributed computing environments.

Other software revenue increased 7.0 percent (9 percent adjusted for currency) driven by growth in software-related services.

(\$ in millions)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent/Margin Change
Software			
External gross profit	\$22,569	\$22,065	2.3%
External gross profit margin	88.7%	88.5%	0.2 pts.
Pre-tax income	\$10,810	\$ 9,970	8.4%
Pre-tax margin	37.6%	35.3%	2.3 pts.

Software gross profit increased 2.3 percent to \$22,569 million in 2012, with a gross profit margin of 88.7 percent, up 0.2 points year to year. Software pre-tax income of \$10,810 million increased 8.4 percent and the pre-tax margin improved 2.3 points to 37.6 percent. Normalized for workforce rebalancing charges of \$94 million and \$6 million in the third quarter of 2012 and 2011, respectively, software pre-tax income was up 9.3 percent and the pre-tax margin expanded 2.6 points. The Software business had another successful year leveraging revenue growth and expense productivity to drive significant margin expansion and profit growth.

Systems and Technology

(\$ in millions)

For the year ended December 31:	2012	2011*	Yr.-to-Yr. Percent Change	Yr.-to-Yr. Percent Change Adjusted for Currency
Systems and Technology external revenue	\$17,667	\$18,985	(6.9)%	(5.9)%
System z			5.4%	6.3%
Power Systems			(8.5)	(7.4)
System x			(3.7)	(2.7)
Storage			(5.8)	(4.1)
Total Systems excluding Retail Store Solutions			(3.7)	(2.5)
Microelectronics OEM			(14.4)	(14.4)
Total Systems and Technology excluding Retail Store Solutions			(5.1)	(4.0)
Retail Store Solutions (Divested in 2012)			(52.6)	(51.7)

*Reclassified to conform with 2012 presentation.

Systems and Technology revenue decreased 6.9 percent (6 percent adjusted for currency) in 2012 versus 2011. Adjusting for the divested RSS business, revenue declined 5.1 percent (4 percent adjusted for currency) in 2012. Growth markets revenue increased 0.3 percent (1 percent adjusted for currency) in 2012, compared to the prior year while major markets revenue decreased 8.3 percent (7 percent adjusted for currency). During 2012, the company's continued investments for innovation supported the introduction of the new System z mainframe, the PureSystems offerings and new Storage and POWER7+ products. In its introductory year, the company sold more than 2,300 PureSystems in over 70 countries.

System z revenue increased 5.4 percent (6 percent adjusted for currency) in 2012 versus 2011. The increase was driven by the new mainframe which began shipping late in the third quarter. Fourth quarter revenue increased 55.6 percent (56 percent adjusted for currency), as revenue increased in the major markets over 50 percent and over 65 percent in the growth markets. MIPS (millions of instructions per second) shipments increased 19 percent in 2012 versus the prior year. The increase in MIPS was driven by the new mainframe shipments, including specialty engines, which increased 44 percent year over year driven by Linux workloads. This is a good indicator of new workloads moving to this platform. The performance reflects the technology leadership and value of the vertically integrated stack that the company's flagship server is delivering to its clients.

Power Systems revenue decreased 8.5 percent (7 percent adjusted for currency) in 2012 versus 2011. Low-end servers increased 6 percent (7 percent adjusted for currency) offset by declines in high-end and midrange products. Early in October, the company announced new POWER7+ based servers. The high-end and mid-range models available in the fourth quarter performed well in the period. The company will continue to refresh the Power portfolio in the first half of 2013. In 2012, the company had nearly 1,200 competitive displacements resulting in over \$1 billion of business; almost equally from Hewlett Packard and Oracle/Sun.

System x revenue decreased 3.7 percent (3 percent adjusted for currency) in 2012 versus 2011. High-end System x revenue increased 5 percent (6 percent adjusted for currency) in 2012 versus the prior year, while high-volume and blade servers declined year to year.

Storage revenue decreased 5.8 percent (4 percent adjusted for currency) in 2012 versus 2011. Total disk revenue decreased 3 percent (1 percent adjusted for currency) in 2012 versus 2011. Tape revenue decreased 16 percent (14 percent adjusted for currency) in 2012 versus the prior year. The value in storage solutions continues to shift to software, as demonstrated by the ongoing success the company is having in its Tivoli storage software offerings.

Retail Stores Solutions revenue decreased 52.6 percent (52 percent adjusted for currency) in 2012 versus 2011. In the third quarter, the company divested the Retail Stores Solutions business to Toshiba Tec. See the caption, "Divestitures," on [page 91](#) for additional information regarding the transaction.

Microelectronics OEM revenue decreased 14.4 percent (14 percent adjusted for currency) in 2012 versus 2011.

(\$ in millions)

	2012	2011	Yr.-to-Yr. Percent/ Margin Change
For the year ended December 31:			
Systems and Technology			
External gross profit	\$6,903	\$7,555	(8.6)%
External gross profit margin	39.1%	39.8%	(0.7) pts.
Pre-tax income	\$1,227	\$1,633	(24.9)%
Pre-tax margin	6.7%	8.2%	(1.5) pts.

The decrease in external gross profit in 2012 versus 2011 was due to lower revenue and a lower overall gross profit margin.

Overall gross margin decreased 0.7 points in 2012 versus the prior year. The decrease was driven by lower margins in System x (0.6 points), Microelectronics (0.6 points), Storage (0.5 points) and Power Systems (0.2 points), partially offset by improvement due to revenue mix (1.2 points).

Systems and Technology's pre-tax income decreased \$406 million (24.9 percent) to \$1,227 million in 2012, with a pre-tax margin of 6.7 percent. Normalized for workforce rebalancing charges of \$46 million and \$3 million in the third quarter of 2012 and 2011, respectively, pre-tax income decreased 22.2 percent and the pre-tax margin decreased by 1.3 points.

Global Financing

See [pages 63 through 67](#) for an analysis of Global Financing's segment results.

Geographic Revenue

In addition to the revenue presentation by reportable segment, the company also measures revenue performance on a geographic basis. The following geographic, regional and country-specific revenue performance excludes OEM revenue, which is discussed separately below.

(\$ in millions)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent Change	Yr.-to-Yr. Percent Change Adjusted for Currency
Total revenue	\$104,507	\$106,916	(2.3)%	0.0%
Geographies	\$102,268	\$104,170	(1.8)%	0.5%
Americas	44,556	44,944	(0.9)	0.0
Europe/Middle East/Africa	31,775	33,952	(6.4)	(1.0)
Asia Pacific	25,937	25,273	2.6	3.3
Major markets			(3.5)%	(1.3)%
Growth markets			4.2%	6.9%
BRIC countries			7.4%	12.2%

Total geographic revenue decreased 1.8 percent (flat adjusted for currency) in 2012; excluding the divested RSS business, revenue decreased 1.4 percent as reported, but increased 1 percent at constant currency compared to the prior year. Revenue performance at constant currency was driven by strong results in the growth markets, offsetting a modest decline year to year in the major markets.

Across all geographies, growth markets revenue increased 4.2 percent (7 percent adjusted for currency) and these countries now represent 24 percent of total geographic revenue, an increase of 8 points since 2006 when the company introduced its 2010 road map. Adjusted for currency, revenue growth in these fast growing markets outpaced the major markets in 2012 by approximately 8 points. The BRIC countries of Brazil, Russia, India and China combined revenue increased 7.4 percent (12 percent adjusted for currency) in 2012, with double-digit growth in Russia, India and China, adjusted for currency. Overall in 2012, the company had double-digit constant currency revenue growth in nearly 35 growth market countries. The company is continuing to expand into new countries and territories, to build out IT infrastructures in support of economic growth and to take a leadership position in key industries. To drive market expansion, in 2012 the company accelerated the opening of new branch offices resulting in a doubling of the number of face-to-face branches when compared to 2011. The company now has almost 450 face-to-face and virtual branch offices in the growth markets.

Americas revenue decreased 0.9 percent (flat adjusted for currency) in 2012. Within the major market countries, the U.S. decreased 1.1 percent and Canada decreased 1.5 percent as reported (flat adjusted for currency). Revenue in the Latin America growth markets increased 1.4 percent (8 percent adjusted for currency) with constant currency growth in Brazil of 6 percent, down 4.6 percent as reported.

Europe/Middle East/Africa (EMEA) revenue decreased 6.4 percent (1 percent adjusted for currency) in 2012 compared to 2011. Within the major market countries, the UK was essentially flat (up 1 percent adjusted for currency), Germany was down 7.6 percent (flat adjusted for currency), France was down 12.6 percent (6 percent

adjusted for currency) and Italy was down 8.4 percent (1 percent adjusted for currency). The EMEA growth markets increased 0.8 percent (5 percent at constant currency) led by growth in Russia of 11.7 percent (13 percent adjusted for currency).

Asia Pacific revenue increased 2.6 percent (3 percent adjusted for currency) year over year. The Asia Pacific growth markets increased 6.0 percent (7 percent adjusted for currency), with growth led by China (17.9 percent as reported, 16 percent at constant currency) and India (decreased 0.9 percent as reported, increased 13 percent at constant currency). Japan revenue decreased 1.9 percent (2 percent adjusted for currency) but improved sequentially throughout the year at constant currency and returned to growth in the fourth quarter of 2012.

OEM revenue of \$2,239 million in 2012 decreased 18.5 percent (18 percent adjusted for currency) compared to 2011, driven by the Microelectronics OEM business.

Total Expense and Other Income

(\$ in millions)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent/ Margin Change
Total consolidated expense and other (income)	\$28,396	\$29,135	(2.5)%
Non-operating adjustments			
Amortization of acquired intangible assets	(328)	(289)	13.3
Acquisition-related charges	(35)	(45)	(21.2)
Non-operating retirement-related (costs)/income	(274)	74	NM
Total operating (non-GAAP) expense and other (income)	\$27,760	\$28,875	(3.9)%
Total consolidated expense-to-revenue ratio	27.2%	27.3%	(0.1) pts.
Operating (non-GAAP) expense-to-revenue ratio	26.6%	27.0%	(0.4) pts.

NM—Not meaningful

Total expense and other (income) decreased 2.5 percent in 2012 versus 2011. Total operating (non-GAAP) expense and other (income) decreased 3.9 percent versus the prior year. The key drivers of the year-to-year change in total expense and other (income) were approximately:

	Total Consolidated	Operating (non-GAAP)
• Currency*	(5) points	(5) points
• Acquisitions**	3 points	2 points
• Base expense	(0) points	(2) points

* Reflects impacts of translation and hedging programs.

** Includes acquisitions completed in prior 12-month period.

In the execution of its strategy, the company continues to invest in its growth initiatives, innovation and strategic acquisitions. The company also has had an ongoing focus on increasing efficiency and productivity across the business.

For additional information regarding total expense and other income, see the following analyses by category.

Selling, General and Administrative

(\$ in millions)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent Change
Selling, general and administrative expense			
Selling, general and administrative—other	\$19,589	\$20,287	(3.4)%
Advertising and promotional expense	1,339	1,373	(2.5)
Workforce rebalancing charges	803	440	82.5
Retirement-related costs	945	603	56.7
Amortization of acquired intangible assets	328	289	13.3
Stock-based compensation	498	514	(3.0)
Bad debt expense	50	88	(42.5)
Total consolidated selling, general and administrative expense	\$23,553	\$23,594	(0.2)%
Non-operating adjustments			
Amortization of acquired intangible assets	(328)	(289)	13.3
Acquisition-related charges	(22)	(20)	10.2
Non-operating retirement-related (costs)/income	(294)	(13)	NM
Operating (non-GAAP) selling, general and administrative expense	\$22,910	\$23,272	(1.6)%

NM—Not meaningful

Total Selling, general and administrative (SG&A) expense decreased 0.2 percent in 2012 versus 2011. The decrease was primarily driven by the effects of currency (3 points), partially offset by acquisition-related spending (2 points), while base spending was essentially flat.

Operating (non-GAAP) SG&A expense decreased 1.6 percent primarily driven by the effects of currency (3 points) and lower base spending (1 point), partially offset by acquisition-related spending (2 points). The increase in workforce rebalancing charges was due to actions primarily focused on the company's non-U.S. operations in the third quarter of 2012. The increase in retirement-related costs was primarily driven by the charge related to a court decision regarding one of IBM UK's defined benefit plans. As a result of the ruling, the company recorded an additional retirement-related obligation of \$162 million in the third quarter of 2012. This charge is not reflected in operating (non-GAAP) SG&A expense. See note M, "Contingencies and Commitments," on pages 110 through 112 for additional information. Bad debt expense decreased \$37 million in 2012 versus 2011, as the company increased its provisions in 2011 reflecting the European credit environment. The accounts receivable provision coverage is 1.4 percent at December 31, 2012, a decrease of 10 basis points from year-end 2011.

Other (Income) and Expense

(\$ in millions)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent Change
Other (income) and expense			
Foreign currency transaction losses/(gains)	\$(240)	\$ 513	NM%
(Gains)/losses on derivative instruments	72	(113)	NM
Interest income	(109)	(136)	(20.2)
Net (gains)/losses from securities and investment assets	(55)	(227)	(75.5)
Other	(511)	(58)	NM
Total consolidated other (income) and expense	\$(843)	\$ (20)	NM%
Non-operating adjustment			
Acquisition-related charges	(13)	(25)	(46.0)
Operating (non-GAAP) other (income) and expense	\$(857)	\$ (45)	NM%

NM—Not meaningful

Other (income) and expense was income of \$843 million and \$20 million in 2012 and 2011, respectively. The increase in income of \$823 million in 2012 was primarily driven by higher gains from foreign currency transactions (\$753 million) due to rate volatility year to year, and the gain associated with the divested RSS business (\$446 million) reflected in Other in the table above. These increases in income were partially offset by increased losses on derivative instruments (\$184 million) and lower gains from securities and investment asset sales (\$171 million). In 2011, the company had investment gains of over \$200 million, primarily from the sale of Lenovo shares.

Research, Development and Engineering

(\$ in millions)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent Change
Total consolidated research, development and engineering	\$6,302	\$6,258	0.7%
Non-operating adjustment			
Non-operating retirement-related (costs)/income	20	88	(76.9)
Operating (non-GAAP) research, development and engineering	\$6,322	\$6,345	(0.4)%

The company continues to invest in research and development, focusing its investments on high-value, high-growth opportunities and extending its technology leadership. Total research, development and engineering (RD&E) expense increased 0.7 percent in 2012 versus 2011, primarily driven by acquisitions (3 points), partially offset by the effects of currency (2 points) and lower base spending (1 point). Operating (non-GAAP) RD&E expense decreased 0.4 percent in 2012 compared to the prior year primarily driven by the effects of currency (2 points) and lower base spending (2 points), partially offset by acquisitions (3 points). RD&E investments represented 6.0 percent of revenue in 2012, compared to 5.9 percent in 2011.

Intellectual Property and Custom Development Income

(\$ in millions)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent Change
Sales and other transfers of intellectual property	\$ 324	\$ 309	4.7%
Licensing/royalty-based fees	251	211	19.0
Custom development income	500	588	(14.9)
Total	\$1,074	\$1,108	(3.0)%

The timing and amount of sales and other transfers of IP may vary significantly from period to period depending upon timing of divestitures, industry consolidation, economic conditions and the timing of new patents and know-how development. There were no significant individual IP transactions in 2012 or 2011.

Interest Expense

(\$ in millions)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent Change
Interest expense			
Total	\$459	\$411	11.8%

The increase in interest expense in 2012 versus 2011 was primarily driven by higher average debt levels, partially offset by lower average interest rates. Interest expense is presented in cost of financing in the Consolidated Statement of Earnings only if the related external borrowings are to support the Global Financing external business. See [pages 66 and 67](#) for additional information regarding Global Financing debt and interest expense. Overall interest expense (excluding capitalized interest) for 2012 was \$1,004 million, an increase of \$40 million year to year.

Stock-Based Compensation

Total pre-tax stock-based compensation cost of \$688 million decreased \$9 million compared to 2011. The decrease was primarily related to the company's performance share units (\$30 million), partially offset by increases related to restricted stock units (\$16 million) and the assumption of stock-based awards previously issued by acquired entities (\$5 million). Cost, and the year-to-year change, was reflected in the following categories: Cost: \$132 million, up \$11 million; SG&A expense: \$498 million, down \$16 million; and RD&E expense: \$59 million, down \$4 million.

See note R, "Stock-Based Compensation," on [pages 117 to 120](#) for additional information on stock-based incentive awards.

Retirement-Related Plans

The following table provides the total pre-tax cost for all retirement-related plans. These amounts are included in the Consolidated Statement of Earnings within the caption (e.g., Cost, SG&A, RD&E) relating to the job function of the plan participants.

(\$ in millions)

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent Change
Retirement-related plans—cost			
Service cost	\$ 493	\$ 549	(10.2)%
Amortization of prior service cost/(credits)	(148)	(157)	(5.5)
Cost of defined contribution plans	1,506	1,513	(0.4)
Total operating costs	\$ 1,851	\$ 1,905	(2.8)%
Interest cost	4,238	4,601	(7.9)
Expected return on plan assets	(6,356)	(6,574)	(3.3)
Recognized actuarial losses	2,407	1,788	34.6
Plan amendments/curtailments/settlements	1	1	14.4
Multi-employer plan/other costs	247	112	121.3
Total non-operating costs/(income)	\$ 538	\$ (72)	NM%
Total retirement-related plans—cost	\$ 2,389	\$ 1,832	30.3%

NM--Not meaningful

In 2012, total retirement-related plans cost increased by \$556 million compared to 2011, primarily driven by an increase in recognized actuarial losses of \$619 million, lower expected return on plan assets (\$219 million) and the charge related to the UK pension litigation (\$162 million). These increases were partially offset by lower interest cost of \$363 million and lower service cost of \$56 million.

As discussed in the "Operating (non-GAAP) Earnings" section on [page 18](#), the company characterizes certain retirement-related costs as operating and others as non-operating. Utilizing this characterization, operating retirement-related costs in 2012 were \$1,851 million, a decrease of \$54 million compared to 2011, primarily driven by the \$56 million decrease in service cost. Non-operating costs of \$538 million increased \$610 million in 2012, compared to the prior year, driven primarily by the increase in recognized actuarial losses (\$619 million), lower expected return on plan assets (\$219 million) and the charge related to the UK pension litigation (\$162 million), partially offset by lower interest cost (\$363 million).

Income Taxes

The effective tax rate for 2012 was 24.2 percent compared with 24.5 percent in 2011. The operating (non-GAAP) tax rate for 2012 was 24.0 percent compared with 24.5 percent in 2011. The 0.3 point decrease in the as-reported effective tax rate was primarily driven by a more favorable geographic mix of pre-tax earnings (2.6 points) and the one-time benefit in the first quarter associated with a tax restructuring in Latin America (0.8 points), primarily offset by a decrease in the utilization of foreign tax credits in 2012 (2.9 points) and the unfavorable tax impact of the gain on the RSS divestiture (0.3 points). The remaining items were individually insignificant.

Earnings Per Share

Basic earnings per share is computed on the basis of the weighted-average number of shares of common stock outstanding during the period. Diluted earnings per share is computed on the basis of the weighted-average number of shares of common stock outstanding plus the effect of dilutive potential common shares outstanding during the period using the treasury stock method. Dilutive potential common shares include outstanding stock options and stock awards.

For the year ended December 31:	2012	2011	Yr.-to-Yr. Percent Change
Earnings per share of common stock			
Assuming dilution	\$14.37	\$13.06	10.0%
Basic	\$14.53	\$13.25	9.7%
Diluted operating (non-GAAP)	\$15.25	\$13.44	13.5%
Weighted-average shares outstanding (in millions)			
Assuming dilution	1,155.4	1,213.8	(4.8)%
Basic	1,142.5	1,197.0	(4.5)%

Actual shares outstanding at December 31, 2012 and 2011 were 1,117.4 million and 1,163.2 million, respectively. The average number of common shares outstanding assuming dilution was 58.3 million shares lower in 2012 versus 2011. The decrease was primarily the result of the common stock repurchase program. See note L, "Equity Activity," on [page 107](#) for additional information regarding common stock activities. Also see note P, "Earnings Per Share of Common Stock," on [page 116](#).

Financial Position

Dynamics

At December 31, 2012, the company's balance sheet and liquidity positions remained strong and well-positioned to support the company's long-term objectives. Cash and marketable securities at year end were \$11,128 million, a decrease of \$794 million from the prior year-end position. During the year the company continued to manage the investment portfolio to meet its capital preservation and liquidity objectives. At December 31, 2012, there were no holdings of European sovereign debt securities in the investment portfolio.

Total debt of \$33,269 million increased \$1,949 million from the prior year-end level. The commercial paper balance at December 31, 2012 was \$1,800 million, a decrease of \$500 million from the prior year. Within total debt, \$24,501 million is in support of the Global Financing business which is leveraged at a 7.0 to 1 ratio. The company continues to have substantial flexibility in the market. During 2012, the company completed bond issuances totaling \$7,875 million, with terms ranging from three to 30 years and priced from 0.55 to 4.00 percent depending on the maturity. The company has consistently generated strong cash flow from operations and continues to have access to additional sources of liquidity through the capital markets and its \$10 billion global credit facility, with 100 percent of the facility available on a same-day basis.

Consistent with accounting standards, the company remeasures the funded status of its retirement and postretirement plans at December 31. At December 31, 2012, the overall net underfunded position was \$20,190 million, an increase of \$3,800 million from December 31, 2011, as the increase in the benefit obligation due to the reduction in discount rates more than offset the returns on plan assets. At year end, the company's qualified defined benefit plans were well funded and the cash requirements related to these plans remain stable going forward at approximately \$1 billion per year through 2015. In 2012, the return on the U.S. Personal Pension Plan assets was 11.3 percent and the plan was 98 percent funded. Overall, global asset returns were 11.1 percent and the company's qualified defined benefit plans worldwide were 94 percent funded.

The company's qualified defined benefit plans do hold European sovereign debt securities in their trust funds. See note S, "Retirement-Related Benefits," on [page 128](#) for additional information.

During 2012, the company generated \$19,586 million in cash from operations, a decrease of \$260 million compared to 2011. In addition, the company generated \$18,185 million in free cash flow in 2012, an increase of \$1,581 million over the prior year. See [pages 56 and 57](#) for additional information on free cash flow. The company returned \$15,768 million to shareholders in 2012, with \$11,995 million in gross share repurchases and \$3,773 million in dividends. In 2012, the company repurchased approximately 61 million shares and had \$8.7 billion remaining in share repurchase authorization at year end. The company's strong cash generation permits the company to invest and deploy capital to areas with the most attractive long-term opportunities.

The assets and debt associated with the Global Financing business are a significant part of the company's financial position. The financial position amounts appearing on [page 72](#) are the consolidated amounts including Global Financing. The amounts appearing in the separate Global Financing section, beginning on [page 63](#), are supplementary data presented to facilitate an understanding of the Global Financing business.

Working Capital

(\$ in millions)		
At December 31:	2012	2011
Current assets	\$49,433	\$50,928
Current liabilities	43,625	42,123
Working capital	\$ 5,807	\$ 8,805
Current ratio	1.13:1	1.21:1

Working capital decreased \$2,998 million from the year-end 2011 position. The key changes are described below:

Current assets decreased \$1,496 million (\$1,212 million adjusted for currency) due to:

- A decrease of \$1,224 million in prepaid expenses and other current assets due to:
 - A decrease of \$610 million related to derivatives; \$398 million in cash collateral received, and \$213 million primarily related to currency rate volatility; and
 - A decrease of \$614 million in various prepaid expenses (taxes, maintenance, insurance, deposits)
- A decline of \$794 million (\$661 million adjusted for currency) in cash and cash equivalents, and marketable securities (see cash flow analysis in the following column); and
- A decrease of \$308 million in inventory, primarily in Systems and Technology; partially offset by
- An increase of \$1,016 million (\$1,047 million adjusted for currency) in short-term receivables primarily attributable to higher volumes of financing receivables driven by customer loans and inventory financing.

Current liabilities increased \$1,502 million (\$1,682 million adjusted for currency) as a result of:

- An increase of \$1,635 million in taxes primarily due to the reclassification of long-term tax liabilities to short term; and
- An increase of \$719 million (\$879 million adjusted for currency) in short-term debt due to:
 - Reclassifications of \$5,638 million from long-term debt and short-term additions of \$4,541 million, offset by
 - Maturities of approximately \$8,792 million, and a decline of approximately \$500 million in commercial paper; partially offset by
- A decrease of \$565 million in accounts payable primarily related to the obligation to return cash collateral received related to derivative valuations.

Cash Flow

The company's cash flows from operating, investing and financing activities, as reflected in the Consolidated Statement of Cash Flows on [page 73](#), is summarized in the table below. These amounts include the cash flows associated with the Global Financing business.

(\$ in millions)		
For the year ended December 31:	2012	2011
Net cash provided by/(used in)		
Operating activities	\$ 19,586	\$ 19,846
Investing activities	(9,004)	(4,396)
Financing activities	(11,976)	(13,696)
Effect of exchange rate changes on cash and cash equivalents	(116)	(493)
Net change in cash and cash equivalents	\$ (1,511)	\$ 1,262

Net cash provided by operating activities decreased by \$260 million in 2012 as compared to 2011 driven by the following key factors:

- A decrease in cash due to receivables of \$1,290 million (normalized for a \$339 million tax refund received in 2012), as a result of higher volumes in 2012;
- A decrease in vendor payables of \$675 million;
- An increase in cash used for workforce rebalancing payments of \$236 million, primarily in the non-U.S.; and
- An increase in cash used for retirement-related plans of \$181 million driven by an increase in nonpension post-retirement contributions, partially offset by
- Lower net tax payments of \$999 million compared to 2011;
- Improved net income of \$749 million; and
- Lower cash requirements for inventory of \$442 million.

Net cash used in investing activities increased \$4,608 million primarily driven by:

- A net increase of \$1,325 million in net cash used for acquisitions/divestitures; and
- A decrease in cash of \$2,719 million from net purchases of marketable securities and other investments.

Net cash used in financing activities decreased \$1,719 million primarily as a result of:

- A decrease of \$2,137 million of net cash used for common stock transactions; partially offset by
- An increase of \$300 million in cash dividends paid.

Noncurrent Assets and Liabilities

(\$ in millions)		
At December 31:	2012	2011
Noncurrent assets	\$69,780	\$65,505
Long-term debt	\$24,088	\$22,857
Noncurrent liabilities (excluding debt)	\$32,516	\$31,217

The increase in noncurrent assets of \$4,276 million (\$4,454 million adjusted for currency) was driven by:

- An increase of \$3,429 million (\$3,236 million adjusted for currency) in goodwill and intangible assets driven by acquisitions;
- An increase of \$470 million in deferred taxes (\$580 million adjusted for currency) driven by retirement-related activity; and
- An increase of \$2,036 million in financing receivables (\$2,214 million adjusted for currency) driven by increased volumes, partially offset by
- A decrease of \$1,899 million in prepaid pension assets (\$1,922 million adjusted for currency) primarily driven by plan remeasurements.

Long-term debt increased by \$1,231 million primarily driven by new debt issuances of \$7,700 million, partially offset by reclasses to short-term debt of \$5,638 million, and debt repurchased as a result of the debt exchange of \$665 million.

Other noncurrent liabilities, excluding debt, increased \$1,299 million (\$1,558 million adjusted for currency) primarily driven by:

- An increase in retirement and nonpension benefit obligations of \$2,044 million (\$2,264 million adjusted for currency) as a result of pension remeasurements; and
- An increase in deferred income of \$644 million driven by services and software arrangements; partially offset by
- A decrease of \$1,389 million in other liabilities driven by a reclass of tax-related liabilities to short term.

Debt

The company's funding requirements are continually monitored and strategies are executed to manage the overall asset and liability profile. Additionally, the company maintains sufficient flexibility to access global funding sources as needed.

(\$ in millions)		
At December 31:	2012	2011
Total company debt	\$33,269	\$31,320
Total Global Financing segment debt	\$24,501	\$23,332
Debt to support external clients	21,583	20,051
Debt to support internal clients	2,919	3,281

Global Financing provides financing predominantly for the company's external client assets, as well as for assets under contract by other IBM units. These assets, primarily for Global Services, generate long-term, stable revenue streams similar to the Global Financing asset portfolio. Based on their attributes, these Global Services assets are leveraged with the balance of the Global Financing asset base. The debt analysis in the previous column is further detailed in the Global Financing section on [pages 66 and 67](#).

Given the significant leverage, the company presents a debt-to-capitalization ratio which excludes Global Financing debt and equity as management believes this is more representative of the company's core business operations. This ratio can vary from period to period as the company manages its global cash and debt positions.

"Core" debt-to-capitalization ratio (excluding Global Financing debt and equity) was 36.1 percent at December 31, 2012 compared to 32.0 percent at December 31, 2011. The increase was primarily driven by an increase in non-Global Financing debt of \$780 million and a decrease in non-Global Financing equity of \$1,497 million from the December 31, 2011 balances.

Consolidated debt-to-capitalization ratio at December 31, 2012 was 63.7 percent versus 60.7 percent at December 31, 2011.

The increase in both the "core" debt-to-capitalization ratio and the consolidated debt-to-capitalization ratio was impacted by the \$5.2 billion impact to equity as a result of retirement-related plan remeasurements in December.

Debt Exchange

In the second quarter of 2012, the company completed an exchange of approximately \$6 million of principal of its 7.125 percent debentures due in 2096, \$104 million principal of its 8.00 percent notes due in 2038 and \$800 million of principal of its 5.60 percent senior notes due in 2039 for approximately \$1,107 million of 4.00 percent senior notes due in 2042 and cash of approximately \$121 million. The exchange was completed to retire high coupon debt in the current favorable interest rate environment.

The debt exchange was accounted for as a non-revolving debt modification in accordance with accounting guidance, and therefore it did not result in any gain or loss recorded in the Consolidated Statement of Earnings. Cash payments will be amortized over the life of the new debt. Administrative fees with third parties in relation to the exchange were expensed as incurred.

Equity

Total equity decreased by \$1,252 million as a result of an increase in treasury stock of \$12,168 million; pension adjustments of \$3,669 million reflecting the impact of retirement-related plan remeasurements; partially offset by an increase in retained earnings of \$12,783 million, and an increase of \$1,980 million in common stock primarily driven by stock option exercises and stock based compensation.

GAAP Reconciliation

The tables below provide a reconciliation of the company's income statement results as reported under GAAP to its operating earnings presentation which is a non-GAAP measure. The company's calculation of operating earnings, as presented, may differ from similarly titled measures reported by other companies. Please refer to the "Operating (non-GAAP) Earnings" section on [page 18](#) for the company's rationale for presenting operating earnings information.

(\$ in millions except per share amounts)

NM—Not meaningful

Snapshot

In the fourth quarter of 2012, the company improved its year-to-year revenue growth rate, primarily in higher margin areas, while driving significant margin expansion and profit growth. The company delivered diluted earning per share of \$5.13, a growth of 11.0 percent, and \$5.39, an increase of 14.4 percent on an operating (non-GAAP) basis. The company generated \$6.3 billion in cash from operations in the fourth quarter driving shareholder returns of \$4.0 billion in gross common stock repurchases and dividends.

Revenue in the fourth quarter declined 0.6 percent as reported, but was flat at constant currency. Normalized for the RSS divestiture, revenue increased 1 point at constant currency in the quarter, a 2 point improvement from the third quarter of 2012 constant currency growth rate. Consistent with the company's business model to move to higher value areas, revenue continued to grow in the higher margin businesses which contributed to the overall margin expansion and profit growth in the fourth quarter.

On a geographic basis, revenue performance was led by the growth markets which increased 6.8 percent as reported and 7 percent at constant currency. The BRIC countries delivered combined growth of 11.4 percent (14 percent adjusted for currency). In the fourth quarter, over 30 growth market countries grew constant currency revenue at a double-digit rate reflecting ongoing broad-based strength.

Within the company's segments, performance was led by continued momentum in the growth initiatives and successful product launches in high-end systems—both of which drove a more profitable mix. Software revenue increased 3.5 percent (4 percent adjusted for currency), driven by business analytics, Smarter Commerce and cloud with strength in several emerging areas where the company has been targeting its investments—Social Business, mobile and security. Systems and Technology revenue declined 0.7 percent (1 percent adjusted for currency); adjusted for the RSS divestiture, revenue increased 3.6 percent (4 percent adjusted for currency) versus the prior year. New product introductions performed well in the quarter. System z revenue increased 55.6 percent (56 percent adjusted for currency) reflecting strong acceptance of the new mainframe. System z revenue increased over 50 percent in the major markets and over 65 percent in the growth markets. Global Services revenue decreased 2.1 percent (1 percent adjusted for currency) with the constant currency growth rate consistent with the third quarter of 2012. Global Services continued to have strong performance in all of the key growth initiatives which are becoming a larger part of the services business.

The consolidated gross profit margin increased 1.8 points versus the fourth quarter of 2011 to 51.8 percent. The operating (non-GAAP) gross margin increased 2.1 points to 52.3 percent. The improvement was driven by a combination of strong mainframe growth, good margin expansion in both services segments and an improving segment mix due to the relative strength of software.

Total expense and other income decreased 1.5 percent in the fourth quarter compared to the prior year. Total operating (non-GAAP) expense and other income decreased 2.3 percent. The year-to-year drivers for both categories were approximately:

	Total Consolidated	Operating (non-GAAP)
• Currency*	(1) point	(1) point
• Acquisitions**	2 points	2 points
• Base expense	(3) points	(3) points

* Reflects impacts of translation and hedging programs.

** Includes acquisitions completed in prior 12-month period.

Pre-tax income grew 7.7 percent and the pre-tax margin was 26.7 percent, an increase of 2.1 points versus the fourth quarter of 2011. Net income increased 6.3 percent and the net income margin increased 1.3 points to 19.9 percent. The effective tax rate for the fourth quarter was 25.5 percent, an increase of 1 point versus the prior year. Operating (non-GAAP) pre-tax income grew 9.5 percent and the operating (non-GAAP) pre-tax margin was 27.7 percent, an increase of 2.6 points versus the prior year. Operating (non-GAAP) net income increased 9.5 percent and the operating (non-GAAP) net income margin was 20.9 percent, an

increase of 1.9 points compared to the prior year. The operating (non-GAAP) effective tax rate was 24.4 percent, flat compared to the fourth quarter of 2011.

Diluted earnings per share of \$5.13 increased \$0.51 or 11.0 percent from the fourth quarter of 2011. In the fourth quarter, the company repurchased 15.4 million shares of its common stock. Operating (non-GAAP) diluted earnings per share increased 14.4 percent reflecting the growth in operating (non-GAAP) net income and the benefits of the common stock repurchase program. Operating (non-GAAP) diluted earnings per share of

\$5.39 increased \$0.68 versus the fourth quarter of 2011 driven by the following factors:

- Revenue decrease at actual rates \$(0.03)
- Margin expansion \$ 0.47
- Common stock repurchases \$ 0.24

Margin expansion was the largest contributor to the growth in operating (non-GAAP) earnings per share in the fourth quarter. This was achieved through a combination of gross margin improvements and expense productivity.

Segment Details

The following is an analysis of the fourth quarter of 2012 versus the fourth quarter of 2011 reportable segment external revenue and gross margin results. Segment pre-tax income includes transactions between the segments that are intended to reflect an arms-length transfer price and excludes certain unallocated corporate items.

(\$ in millions)

For the fourth quarter:	2012	2011	Yr.-to-Yr. Percent/ Margin Change	Yr.-to-Yr. Percent Change Adjusted for Currency
Revenue				
Global Technology Services	\$10,284	\$10,452	(1.6)%	(0.3)%
Gross margin	37.6%	36.6%	1.1 pts.	
Global Business Services	4,720	4,877	(3.2)%	(2.0)%
Gross margin	29.9%	29.3%	0.7 pts.	
Software	7,915	7,648	3.5%	4.2%
Gross margin	90.6%	89.8%	0.8 pts.	
Systems and Technology	5,763	5,803	(0.7)%	(0.6)%
Gross margin	44.1%	40.5%	3.6 pts.	
Global Financing	535	548	(2.3)%	(0.9)%
Gross margin	43.8%	49.7%	(5.9) pts.	
Other	87	159	(45.3)%	(45.1)%
Gross margin	(73.2)%	(11.0)%	(62.2) pts.	
Total consolidated revenue	\$29,304	\$29,486	(0.6)%	0.3%
Total consolidated gross profit	\$15,167	\$14,722	3.0%	
Total consolidated gross margin	51.8%	49.9%	1.8 pts.	
Non-operating adjustments

Operating (non-GAAP) gross profit	\$15,327	\$14,793	3.6%	
Operating (non-GAAP) gross margin	52.3%	50.2%	2.1 pts.	

NM—Not meaningful

Global Services

The Global Services segments, Global Technology Services and Global Business Services delivered \$15,004 million of revenue in the fourth quarter, a decrease of 2.1 percent (1 percent adjusted for currency) year to year. Overall revenue performance in the quarter was led by the growth markets with revenue up 5.8 percent (7 percent adjusted for currency). Total outsourcing revenue of \$6,978 million decreased 3.2 percent (2 percent adjusted for currency) and total transactional revenue of \$6,184 million decreased 1.0 percent (flat

adjusted for currency) year over year. Total Global Services pre-tax income was \$2,868 million, an increase of 3.5 percent year to year. The combined pre-tax margin improved 1 point year to year to 18.5 percent.

Global Technology Services revenue of \$10,284 million decreased 1.6 percent as reported, but was flat on a constant currency basis in the fourth quarter versus the same period in 2011. There were two major factors within the major markets that impacted outsourcing

revenue growth in the quarter. First, GTS did a tremendous amount of work to address a number of low margin contracts to improve the profitability of the outsourcing portfolio. The benefits of that work were realized in profit and margin performance, though it did have some impact on revenue. In the fourth quarter, the impact was 1 point of year-to-year revenue growth to GTS, and to Global Services in total. Second, revenue from sales and volumes into existing base accounts declined year to year in the fourth quarter. This activity tends to be more transactional in nature and economically sensitive. The impact of these factors are reflected in GTS Outsourcing revenue, which decreased 3.1 percent (2 percent adjusted for currency) in the fourth quarter. Outsourcing revenue in the growth markets increased 6.1 percent, 8 percent at constant currency, and the outsourcing backlog in these markets was up 9 percent at constant currency. The backlog growth reflects an ongoing trend as clients are building out their infrastructures and scaling to meet the growth objectives of their businesses. ITS revenue of \$2,542 million increased 2.1 percent (3 percent adjusted for currency) in the fourth quarter with the growth markets up 10.1 percent (10 percent at constant currency). GTS gross profit increased 1.3 percent and the gross profit margin improved 1.1 points to 37.6 percent with margin improvement across all lines of business. GTS fourth-quarter 2012 pre-tax income increased 5.0 percent to \$2,027 million with the pre-tax margin expanding 1.2 points to 19.2 percent, versus the fourth quarter of 2011. Margin expansion resulted from increased efficiency and productivity from the focus on automation and process, primarily through the company's enterprise productivity initiatives.

Global Business Services revenue of \$4,720 million decreased 3.2 percent (2 percent adjusted for currency) in the fourth quarter of 2012. From a geographic perspective, the growth markets increased 2.0 percent (3 percent at constant currency) and Japan improved 0.3 percent (6 percent at constant currency)—the second consecutive quarter of revenue growth in Japan. The growth initiatives continued to drive strong performance with double-digit revenue growth in business analytics, Smarter Planet and cloud offerings in the quarter. Application Outsourcing revenue decreased 3.8 percent (2 percent adjusted for currency) and C&SI revenue decreased 3.0 percent (2 percent adjusted for currency). GBS has been taking actions to address the more traditional customized packaged application work including: adding partners, increasing sales capability and targeting and closing large transformational opportunities in the growth markets. GBS gross profit decreased 1.0 percent in the fourth quarter with the gross profit margin expanding 0.7 points versus the prior year. GBS pre-tax income of \$841 million was essentially flat year to year with a pre-tax margin of 17.2 percent, an improvement of 0.6 points. Improved utilization and improved services delivery more than offset the impact from revenue.

Software

Software revenue of \$7,915 million increased 3.5 percent (4 percent adjusted for currency) in the fourth quarter with growth in all the key brands, and particular strength and share gains in WebSphere, Lotus and Rational. Key branded middleware revenue increased 5.4 percent (6 percent adjusted for currency) year to year and gained share as the software business continued to be the leader in the middleware market. The software business had continued

momentum across its brands in the growth initiatives in the fourth quarter with strong performance in business analytics, Smarter Commerce and cloud. WebSphere revenue increased 10.6 percent (11 percent adjusted for currency) in the fourth quarter year to year and gained share. The company continued to expand its portfolio to capture the emerging opportunity around mobile computing and had solid revenue growth in several of its core WebSphere offerings, such as application servers and commerce in the fourth quarter. Information Management revenue increased 2.2 percent (3 percent adjusted for currency) and held share with strong performance in Information Integration and predictive analytics, both driven by big data. Tivoli revenue increased 4.3 percent (5 percent adjusted for currency) and held share, led by its storage and security offerings. Revenue from the storage portfolio increased 12 percent (13 percent adjusted for currency), reflecting the continued value of storage software. Tivoli security increased 16 percent (16 percent adjusted for currency) driven by Q1 Labs. Lotus revenue increased 8.6 percent (9 percent adjusted for currency) and gained share as the Lotus portfolio continues to transform to the faster-growing social business offerings. Revenue growth was driven by strong performance from the existing social business offerings and the recent acquisition of Kenexa, which closed in December 2012. Kenexa helps clients create a more efficient and effective workforce, and brings a unique combination of cloud-based technology and consulting services to an already extensive portfolio of social business solutions. Rational revenue increased 11.6 percent (12 percent adjusted for currency) in the fourth quarter and gained share. Growth was driven by double-digit growth in both analysis, modeling and design software and the Automated Software Quality business. Software gross profit increased 4.5 percent and the gross profit margin expanded 0.8 points to 90.6 percent. Software delivered pre-tax income of \$4,017 million in the fourth quarter, a growth of 8.3 percent compared to the fourth quarter of 2011, with a pre-tax margin of 46.0 percent, up 2.4 points.

Systems and Technology

Systems and Technology revenue of \$5,763 million decreased 0.7 percent (1 percent adjusted for currency); adjusted for the RSS divestiture, revenue increased 3.6 percent (4 percent adjusted for currency). Performance was driven by the company's new mainframe and momentum in PureSystems—the company's new expert integrated systems. System z revenue increased 55.6 percent (56 percent adjusted for currency) driven by the first full quarter of the new mainframe product. MIPS shipments increased 66 percent year to year; the largest quarter of MIPS shipments in history. Approximately half of these MIPS were specialty engines, which were up over 80 percent year to year driven by Linux workloads. Revenue growth in System z was over 50 percent in the major markets and over 65 percent in the growth markets. In the growth markets, the company had strong sales to established as well as new mainframe customers. Power Systems revenue decreased 18.9 percent (19 percent adjusted for currency), although both the new POWER7+ midrange and high-end Power servers performed well in the quarter. In the fourth quarter, the company had over 350 competitive displacements resulting in over \$335 million of business; approximately half of which came from

Oracle/Sun and half from Hewlett Packard. System x revenue decreased 2.5 percent (3 percent adjusted for currency) in the fourth quarter year to year. Storage hardware revenue decreased 5.4 percent (5 percent adjusted for currency) driven by tape products. Total tape revenue decreased 23 percent (23 percent adjusted for currency) while total disk revenue was essentially flat year to year. Within disk, the company announced the new high-end DS8870 in October 2012, and the product was sold out in the fourth quarter. Systems and Technology gross margin increased 3.6 points to 44.1 percent driven primarily by a mix to the higher margin System z in the fourth quarter of 2012. Systems and Technology's pre-tax income increased 23.2 percent to \$974 million in the fourth quarter and the pre-tax margin increased 3.2 points to 16.4 percent. Systems and Technology's profit performance was driven by the new product introductions in mainframe, Power, Storage and PureSystems.

Global Financing

Global Financing revenue of \$535 million decreased 2.3 percent (1 percent adjusted for currency), driven by a decrease in financing revenue, partially offset by an increase in used equipment sales revenue. The Global Financing fourth-quarter pre-tax income increased 0.7 percent to \$518 million and the pre-tax margin increased 0.9 points to 46.9 percent.

Geographic Revenue

Total geographic revenue of \$28,624 million decreased 0.5 percent (flat adjusted for currency) in the fourth quarter of 2012 compared to the prior year. Americas revenue of \$12,550 million increased 0.3 percent (1 percent adjusted for currency) in 2012, led by strong growth in Latin America (up 13.5 percent as reported and 18 percent adjusted for currency). The U.S. was down 0.7 percent, but the growth rate improved 3 points compared to the third quarter of 2012. Canada was down 6.2 percent (9 percent adjusted for currency) compared to strong year-to-year growth of 13 percent at constant currency in the fourth quarter of 2011. EMEA revenue of \$9,091 million decreased 5.0 percent (3 percent adjusted for currency), reflecting the macroeconomic climate in that region. Germany was down 7.0 percent (4 percent adjusted for currency) and the UK was down 4.7 percent (7 percent adjusted for currency). Italy revenue decreased 3.4 percent (flat adjusted for currency), an improvement sequentially from the third-quarter constant currency growth rate. Asia Pacific revenue of \$6,984 million increased 4.2 percent (5 percent adjusted for currency) led by Japan, which returned to growth (0.2 percent as reported, 5 percent at constant currency) in the fourth quarter of 2012. Across all geographies, revenue from the growth markets increased 6.8 percent (7 percent adjusted for currency) in the fourth quarter and outpaced growth in the major markets by 9 points on a constant currency basis. Revenue performance was again broad based with over 30 growth market countries delivering double-digit revenue growth year to year, adjusted for currency. Within the BRIC countries, combined revenue increased 11.4 percent (14 percent adjusted for currency), the strongest quarterly growth in 2012. Brazil returned to growth in the fourth quarter with revenue up 15.5 percent (24 percent adjusted for currency). The growth markets also had good performance in Africa, led by South Africa, and in the Middle East.

OEM revenue of \$679 million in the fourth quarter decreased 4.9 percent (5 percent adjusted for currency) compared to the prior year.

Total Expense and Other Income

(\$ in millions)

	2012	2011	Yr.-to-Yr. Percent/ Margin Change
For the fourth quarter:			
Total consolidated expense and other (income)	\$7,336	\$7,448	(1.5)%
Non-operating adjustments			
Amortization of acquired intangible assets	(86)	(72)	19.6
Acquisition-related charges	(12)	(13)	(8.2)
Non-operating retirement-related (costs)/income	(23)	25	NM
Total operating (non-GAAP) expense and other (income)	\$7,215	\$7,388	(2.3)%
Total consolidated expense-to-revenue ratio	25.0%	25.3%	(0.2) pts.
Operating (non-GAAP) expense-to-revenue ratio	24.6%	25.1%	(0.4) pts.

NM—Not meaningful

Total expense and other income decreased 1.5 percent year to year in the fourth quarter with an expense-to-revenue-ratio of 25.0 percent compared to 25.3 percent in the fourth quarter of 2011. Total operating (non-GAAP) expense and other income decreased 2.3 percent in the fourth quarter. The decrease in total expense and other income was primarily driven by lower base expense (3 points) and currency (1 point), partially offset by increased expense from the company's acquisitions over the past 12 months (2 points). Within Selling, general and administrative expense, accounts receivable provisions were approximately \$20 million in the fourth quarter of 2012 an improvement of nearly \$70 million from the fourth quarter of 2011 when provisions were increased to reflect the European credit environment.

Cash Flow

The company generated \$6,346 million in cash flow provided by operating activities, a decrease of \$751 million compared to the fourth quarter of 2011, driven primarily by an increase in cash used in operating assets and liabilities (\$889 million). Net cash used in investing activities of \$4,092 million increased \$587 million primarily due to an increase in cash used by non-operating finance receivables (\$501 million) and an increase in cash used from net purchases of marketable securities and other investments (\$300 million). Net cash used in financing activities of \$3,791 million increased \$982 million compared to the prior year primarily due to a net decrease in cash from total debt (\$1,397 million); partially offset by a decrease in cash used for gross common stock repurchases (\$575 million).

GAAP Reconciliation

The tables below provide a reconciliation of the company's income statement results as reported under GAAP to its operating earnings presentation which is a non-GAAP measure. The company's calculation of operating earnings, as presented, may differ from similarly titled measures reported by other companies. Please refer to the "Operating (non-GAAP) Earnings" section on [page 18](#) for the company's rationale for presenting operating earnings information.

Snapshot

In 2011, the company delivered strong financial results highlighted by solid revenue performance, continued margin expansion, strong profit and cash generation and effective use of cash. In its centennial year, the company achieved record levels of revenue, profit, free cash flow and earnings per share. The financial performance was the result of the transformation of the company which began years ago. This transformation has been focused on shifting the business to higher value areas of the market, improving productivity and investing in opportunities to drive future growth. These changes have contributed to nine consecutive years of double-digit earnings per share growth. More importantly, this transformation has strengthened the business and put the company on track to achieve its 2015 road map objective of at least \$20 of operating (non-GAAP) earnings per share.

The focus on key growth initiatives and investments in innovation have enabled the company to expand into new markets and capitalize on trends like business analytics and cloud computing. The growth markets strategy to expand into new markets, build out IT infrastructures and lead in specific industries is driving strong performance and market share gains. Growth markets revenue increased 16.0 percent (11 percent adjusted for currency) in 2011 contributing approximately two-thirds of the total constant currency revenue growth for the year and represented 22 percent of total geographic revenue. The company's business analytics solutions helps clients leverage massive amounts of data and content to gain business insight and optimize results. Business analytics revenue increased 16 percent compared to 2010. The Smarter Planet offerings generated close to 50 percent growth year to year, with Smarter Commerce demonstrating strong market momentum. In Cloud Computing, the company is helping its clients improve the economics of information technology. In 2011, the company continued to expand its offerings and cloud revenue for the year was more than three times the prior year results. With strong contribution from these growth initiatives, the company delivered revenue growth of 7.1 percent (3 percent adjusted for currency) compared to 2010.

Segment performance was led by Software which increased revenue 10.9 percent (8 percent adjusted for currency) driven by key branded middleware which increased 15.6 percent (13 percent adjusted for currency) and continued to extend its lead in the middleware market. In the Global Services business, Global Technology Services increased 7.0 percent (3 percent adjusted for currency) and Global Business Services grew revenue 5.8 percent (1 percent adjusted for currency) driven by strong performance in the growth markets where both segments grew revenue 11 percent at constant currency. Systems and Technology delivered revenue growth of 5.6 percent (3 percent adjusted for currency) driven by strong performance in Power Systems which increased 12.0 percent (9 percent adjusted for currency) and the growth markets which increased 14.9 percent (12 percent adjusted for currency).

The consolidated gross profit margin increased 0.8 points versus 2010 to 46.9 percent. This was the eighth consecutive year of improvement in the gross profit margin. The operating (non-GAAP) gross margin of 47.2 percent increased 1.1 points compared to the prior year. The increase in gross margin in 2011 was driven by margin improvements in Software, Systems and Technology and Global Services, and an improved revenue mix driven by Software.

Total expense and other income increased 10.8 percent in 2011 versus the prior year. Total operating (non-GAAP) expense and other income increased 10.2 percent compared to the prior year. The year-to-year drivers for both categories were approximately:

- Currency* 4 points
- Acquisitions** 3 points
- Base expense 3 points

* Reflects impacts of translation and hedging programs.

** Includes acquisitions completed in prior 12-month period.

Pre-tax income grew 6.5 percent and the pre-tax margin was 19.6 percent, a decrease of 0.1 points versus 2010. Net income increased 6.9 percent and the net income margin was 14.8 percent, flat versus 2010. The effective tax rate for 2011 was 24.5 percent, compared with 24.8 percent in the prior year. Operating (non-GAAP) pre-tax income grew 8.7 percent and the operating (non-GAAP) pre-tax margin was 20.2 percent, an increase of 0.3 points versus the prior year. Operating (non-GAAP) earnings increased 8.6 percent and the operating (non-GAAP) earnings margin of 15.3 percent increased 0.2 points versus the prior year. The operating (non-GAAP) effective tax rate was 24.5 percent versus 24.4 percent in 2010.

Diluted earnings per share improved 13.4 percent reflecting the growth in net income and the benefits of the common stock repurchase program. In 2011, the company repurchased approximately 89 million shares of its common stock. Diluted earnings per share of \$13.06 increased \$1.54 from the prior year. Operating (non-GAAP) diluted earnings per share of \$13.44 increased \$1.77 versus 2010 driven by the following factors:

- Revenue increase at actual rates \$0.82
- Margin expansion \$0.18
- Common stock repurchases \$0.77

At December 31, 2011, the company's balance sheet and liquidity were well positioned to support the company's objectives. Cash and cash equivalents at year end was \$11,922 million. Key drivers in the balance sheet and total cash flows are highlighted below.

Total assets increased \$2,981 million (\$4,636 million adjusted for currency) from December 31, 2010 driven by:

- Increases in total receivables (\$1,564 million), cash and cash equivalents (\$1,262 million), goodwill (\$1,077 million) and prepaid expenses and other assets (\$1,022 million), partially offset by
- Decreases in marketable securities (\$990 million) and investments and sundry assets (\$883 million).

Total liabilities increased \$5,918 million (\$6,324 million adjusted for currency) from December 31, 2010 driven by:

- Increases in total debt (\$2,695 million), retirement and nonpension postretirement benefit obligations (\$2,396 million), accounts payable (\$713 million) and deferred income (\$798 million), partially offset by
- Decreases in taxes payable (\$903 million).

Total equity of \$20,236 million decreased \$2,937 million from December 31, 2010 as a result of:

- Increased treasury stock (\$14,803 million) driven by share repurchases, pension adjustments (\$2,448 million) and currency translation adjustments (\$711 million), partially offset by
- Higher retained earnings (\$12,326 million) and common stock (\$2,711 million).

The company generated \$19,846 million in cash flow from operations, an increase of \$298 million compared to 2010, primarily driven by the increase in net income. Net cash used in investing activities of \$4,396 million was \$4,111 million lower than 2010, driven by less cash used for acquisitions (\$4,111 million). Net cash used in financing activities of \$13,696 million was \$1,267 million higher, compared to 2010, primarily due to lower cash from common stock transactions (\$991 million) and increased dividend payments (\$296 million).

Segment Details

The following is an analysis of the 2011 and 2010 reportable segment results. The table below presents each reportable segment's external revenue and gross margin results. Segment pre-tax income includes transactions between the segments that are intended to reflect an arm's-length transfer price and excludes certain unallocated corporate items.

(\$ in millions)

For the year ended December 31:	2011	2010	Yr.-to-Yr. Percent/ Margin Change	Yr.-to-Yr. Percent Change Adjusted for Currency
Revenue				
Global Technology Services	\$ 40,879	\$38,201	7.0%	2.7%

Operating (non-GAAP) gross margin	47.2%	46.1%	1.1 pts.	

NM—Not meaningful

The Product Lifecycle Management (PLM) transaction gain recorded in the first quarter of 2010 impacted the year-to-year results of the company's reportable segments for 2011 compared to 2010. In addition, workforce rebalancing charges were incurred in every segment in the first quarter of both years. The PLM transaction gain (\$591 million) was recorded in Software in the first quarter of 2010.

In the segment analysis on [page 47](#), each segment's pre-tax income and pre-tax margin for 2011 and 2010 is presented on an as-reported basis and on a basis normalized for these actions in both years to provide a better perspective of the underlying operational performance of the segments.

Global Services

The Global Services segments, GTS and GBS, delivered \$60,163 million of revenue in 2011, an increase of 6.6 percent (2 percent adjusted for currency) compared to 2010. Services revenue performance, adjusted for currency, was consistent over the course of the year driven by stability in the backlog. Performance in 2011 was led by strength in the growth markets with total services revenue up 16.9 percent (11 percent adjusted for currency) and gross

margin 2 points higher than in the major markets. The services segments also had good performance in the other key growth initiatives: cloud, business analytics and Smarter Planet. Total outsourcing revenue of \$28,301 million increased 7.8 percent (3 percent adjusted for currency) and total transactional revenue of \$24,348 million increased 6.2 percent (2 percent adjusted for currency) year to year.

(\$ in millions)

	2011	2010	Yr.-to-Yr. Percent Change	Yr.-to-Yr. Percent Change Adjusted for Currency
For the year ended December 31:				
Global Services external revenue	\$60,163	\$56,424	6.6%	2.3%
Global Technology Services	\$40,879	\$38,201	7.0%	2.7%
Outsourcing	23,911	22,241	7.5	3.0
Integrated Technology Services	9,453	8,714	8.5	4.1
Maintenance	7,515	7,250	3.6	(0.2)
Global Business Services	\$19,284	\$18,223	5.8%	1.5%
Outsourcing	4,390	4,007	9.5	4.8
Consulting and Systems Integration	14,895	14,216	4.8	0.5

GTS revenue of \$40,879 million increased 7.0 percent (3 percent adjusted for currency) in 2011 versus 2010. Revenue performance was led by the growth markets which were up 16.8 percent (11 percent adjusted for currency). GTS Outsourcing revenue increased 7.5 percent (3 percent adjusted for currency) in 2011 and gained share. Outsourcing performance in 2011 was driven by strength in the growth markets with revenue up 11 percent, adjusted for currency, as the outsourcing offerings are continuing to help clients build out their IT infrastructures. ITS revenue increased 8.5 percent (4 percent adjusted for currency) in 2011 versus 2010, also led by the growth markets which increased 13 percent, adjusted for currency. Revenue growth year over year, adjusted for currency, in both GTS Outsourcing and ITS was relatively consistent over the course of the year.

GBS revenue of \$19,284 million increased 5.8 percent (1 percent adjusted for currency) in 2011 led by strength in the growth markets with revenue up 17.4 percent (11 percent adjusted for currency). Application Outsourcing revenue increased 9.5 percent (5 percent adjusted for currency) in 2011 year to year. C&SI, which includes Consulting, Application Management Services systems integration and the U.S. Federal business, grew revenue in 2011 4.8 percent (1 percent adjusted for currency). Both GBS lines of business had strong year-to-year performance in the growth markets with double-digit constant currency revenue growth. GBS was impacted in 2011 by revenue declines in Japan and in the Public Sector; excluding Japan and the Public Sector, total GBS revenue increased 11.9 percent in 2011 (8 percent adjusted for currency).

(\$ in millions)

	2011	2010	Yr.-to-Yr. Percent/ Margin Change
For the year ended December 31:			
Global Services			
Global Technology Services			
External gross profit	\$14,320	\$13,194	8.5%
External gross profit margin	35.0%	34.5%	0.5 pts.
Pre-tax income	\$ 6,284	\$ 5,499	14.3%
Pre-tax margin	14.9%	13.9%	1.0 pts.
Pre-tax income—normalized*	\$ 6,399	\$ 5,771	10.9%
Pre-tax margin—normalized	15.2%	14.6%	0.6 pts.
Global Business Services			
External gross profit	\$ 5,545	\$ 5,106	8.6%
External gross profit margin	28.8%	28.0%	0.7 pts.
Pre-tax income	\$ 3,006	\$ 2,546	18.1%
Pre-tax margin	15.0%	13.4%	1.6 pts.
Pre-tax income—normalized**	\$ 3,052	\$ 2,674	14.1%
Pre-tax margin—normalized	15.2%	14.1%	1.1 pts.

* Excludes \$116 million and \$273 million of workforce rebalancing charges in the first quarter of 2011 and 2010, respectively.

** Excludes \$45 million and \$128 million of workforce rebalancing charges in the first quarter of 2011 and 2010, respectively.

GTS gross profit increased 8.5 percent in 2011 and gross margin improved 0.5 points year to year. Margin expansion was driven by improved gross profit performance in all lines of business. Pre-tax income increased to \$6,284 million in 2011 with a pre-tax margin of 14.9 percent. On a normalized basis, segment pre-tax income in 2011 increased 10.9 percent and margin expanded 0.6 points to 15.2 percent.

GBS gross profit increased 8.6 percent in 2011 and gross margin improved 0.7 points to 28.8 percent, led primarily by margin improvement in Application Management Services Outsourcing. GBS segment pre-tax income improved 18.1 percent to \$3,006 million with a pre-tax margin of 15.0 percent. On a normalized basis, segment pre-tax income in 2011 increased 14.1 percent with a pre-tax margin of 15.2 percent, an increase of 1.1 points year to year.

Total Global Services segment pre-tax income was \$9,290 million in 2011, an increase of \$1,246 million or 15.5 percent year to year. The combined pre-tax margin in 2011 improved 1.2 points versus 2010. On a normalized basis, total Global Services pre-tax income in 2011 increased 11.9 percent with a pre-tax margin of 15.2 percent, up 0.8 points year to year. In 2011, the company established two Global Services integration hubs which will drive the business to a new level of global consistency, integration and standardization in the development and delivery of solutions to clients. Both Global Services segments had strong profit and margin performance in 2011 as they continued to mix to higher value offerings and markets, and continued to focus on productivity and cost management.

Software

(\$ in millions)

For the year ended December 31:	2011	2010	Yr.-to-Yr. Percent Change	Yr.-to-Yr. Percent Change Adjusted for Currency
Software external revenue	\$24,944	\$22,485	10.9%	8.0%
Middleware	\$20,650	\$18,445	12.0%	9.0%
Key Branded Middleware	16,051	13,879	15.6	12.7
WebSphere			40.5	37.4
Information Management			12.5	9.6
Lotus			3.8	0.2
Tivoli			10.2	7.4
Rational			4.9	1.8
Other middleware	4,600	4,565	0.8	(1.9)
Operating systems	2,479	2,282	8.6	5.6
Other	1,814	1,758	3.2	0.4

Software revenue of \$24,944 million increased 10.9 percent (8 percent adjusted for currency) in 2011 compared to 2010. Adjusting for the divested PLM operations, revenue grew at 11.8 percent (9 percent adjusted for currency) in 2011. Revenue growth was driven by key branded middleware, reflecting continued strong demand for the company's offerings and solid growth in key focus areas such as Smarter Commerce and business analytics. Overall, the Software business had another very good year in 2011, delivering nearly \$10 billion in segment pre-tax income, an increase of \$500 million from 2010. The company continued to invest in additional capabilities for the Software business through both organic investments and strategic acquisitions, including the completion of five acquisitions in 2011, plus acquisitions announced in the fourth quarter of 2011 that closed in the first quarter of 2012.

Key branded middleware revenue increased 15.6 percent (13 percent adjusted for currency) and again gained market share in 2011, as the Software business extended its lead in the middleware

market. Software revenue continued to mix to the faster growing branded middleware which accounted for 64 percent of total software revenue in 2011, an increase of 3 points from 2010. Performance in 2011 was led by strong double-digit growth in WebSphere. The Software business continued to have solid performance in its growth initiatives, with business analytics revenue up double digits in 2011 year to year.

WebSphere revenue increased 40.5 percent (37 percent adjusted for currency) in 2011 with strong performance throughout the year and gained share. WebSphere's five product areas all had revenue growth of 18 percent or higher in 2011, led by the Smarter Commerce offerings, which more than tripled year to year. This performance contributed to the company's overall growth in the retail industry in each of the last two years. The 2010 acquisitions of Sterling Commerce, Coremetrics and Unica Corporation all contributed to the WebSphere year-to-year performance.

Information Management revenue increased 12.5 percent (10 percent adjusted for currency) and gained share in 2011 compared to 2010. Distributed Database revenue increased 33 percent in 2011, led by strong performance from the Netezza offerings. Since acquiring Netezza in November 2010, the Software business has expanded the Netezza customer base by over 40 percent. The company's business analytics software offerings, most of which are part of Information Management, continued to outpace the market with double-digit revenue growth, year to year in 2011.

Lotus revenue increased 3.8 percent (flat adjusted for currency) in 2011 compared to 2010, with growth driven by the Social Business offerings.

Tivoli revenue increased 10.2 percent (7 percent adjusted for currency) in 2011 when compared to 2010 and gained share. Revenue growth was led by Storage software with growth of 25 percent (22 percent adjusted for currency). Security solutions software also delivered growth in 2011, with revenue up 9 percent (6 percent adjusted for currency).

Rational revenue increased 4.9 percent (2 percent adjusted for currency) in 2011 versus 2010 and gained share. Revenue growth was driven by Telelogic, which increased 11 percent (7 percent adjusted for currency) year to year.

Operating systems revenue increased 8.6 percent (6 percent adjusted for currency) in 2011 compared to 2010, driven primarily by growth in Power Systems.

Other software revenue increased 3.2 percent (flat adjusted for currency) with growth in software-related services partially offset by the divestiture of the PLM operations in the first quarter of 2010.

Systems and Technology

(\$ in millions)

For the year ended December 31:	2011*	2010*	Yr.-to-Yr. Percent Change	Yr.-to-Yr. Percent Change Adjusted for Currency
Systems and Technology external revenue	\$18,985	\$17,973	5.6%	3.2%
System z			0.3%	(2.1)%
Power Systems			12.0	9.5
System x			5.7	2.4
Storage			5.8	3.1
Total Systems excluding Retail Store Solutions			6.3	3.5
Microelectronics OEM			0.2	0.1
Total Systems and Technology excluding Retail Store Solutions			5.4	3.0
Retail Store Solutions (Divested in 2012)			11.6	9.4

*Reclassified to conform with 2012 presentation.

Systems and Technology revenue increased 5.6 percent (3 percent adjusted for currency) in 2011 versus 2010. Performance in 2011 was driven by the growth markets which increased 14.9 percent (12 percent adjusted for currency). The major markets increased 2.7 percent, but were essentially flat at constant currency versus the prior year period.

(\$ in millions)

For the year ended December 31:	2011	2010	Yr.-to-Yr. Percent/ Margin Change
Software			
External gross profit	\$22,065	\$19,774	11.6%
External gross profit margin	88.5%	87.9%	0.5 pts.
Pre-tax income	\$ 9,970	\$ 9,466	5.3%
Pre-tax margin	35.3%	37.2%	(1.9)pts.
Pre-tax income-normalized*	\$10,009	\$ 8,972	11.6%
Pre-tax margin—normalized	35.5%	35.3%	0.2 pts.

*Excludes \$39 million and \$98 million of workforce rebalancing charges in the first quarter of 2011 and 2010, respectively, and \$(691) million related to the PLM gain in the first quarter of 2010.

Software gross profit increased 11.6 percent to \$22,065 million in 2011 driven primarily by the growth in revenue. Gross profit margin improved 0.5 points versus 2010. Software delivered segment pre-tax income of \$9,970 million in 2011, an increase of 5.3 percent versus 2010. On a normalized basis, segment pre-tax income increased 11.6 percent and segment pre-tax margin improved 0.2 points to 35.5 percent in 2011. The Software segment delivered strong margin and profit growth in 2011 and contributed to the company's continued margin expansion and profit performance.

System z revenue increased 0.3 percent (down 2 percent adjusted for currency) in 2011 versus 2010. MIPS shipments increased 16 percent in 2011 versus 2010. The revenue performance and lower MIPS growth was a result of the strong prior-year performance and was consistent with prior mainframe product cycles, as the company successfully launched its zEnterprise 196 (z196) server in the third quarter of 2010. Since the z196 server began shipping, the company added over 115 new System z clients, with more than 33 percent in the growth markets through year-end 2011.

Power Systems revenue increased 12.0 percent (9 percent adjusted for currency) in 2011 versus 2010 with performance driven by strong growth in high-end systems. High-end systems revenue increased 31 percent (28 percent adjusted for currency) in 2011 compared to 2010. The company extended its market leadership in 2011, having posted 15 consecutive quarters of year-to-year share gains. In addition, this was the second consecutive year that the company had over 1,000 competitive displacements, which this year generated over \$1 billion of business; approximately 50 percent of this business was from Hewlett Packard, with most of the balance from Oracle/Sun.

System x revenue increased 5.7 percent (2 percent adjusted for currency) in 2011 compared to 2010. High-end System x revenue increased 35 percent (31 percent adjusted for currency) in 2011 versus the prior year. System x revenue increased 22 percent (18 percent adjusted for currency) in the growth markets and closed the year with its ninth consecutive quarter with a double-digit increase in the growth markets.

Storage revenue increased 5.8 percent (3 percent adjusted for currency) in 2011 versus 2010. Total disk revenue increased 7 percent (4 percent adjusted for currency) in 2011 versus 2010, driven by growth in enterprise disk products. Tape revenue increased 3 percent (flat adjusted for currency) in 2011 versus 2010. When combined with storage software, total storage revenue increased 10 percent in 2011 compared to the prior year.

Retail Stores Solutions revenue increased 11.6 percent (9 percent adjusted for currency) in 2011 versus the prior year. The brand gained share in 2011 and contributed to the company's overall improved performance in the retail industry.

Microelectronics OEM revenue increased 0.2 percent (flat adjusted for currency) in 2011 versus 2010, as the company shifted its production to meet internal demand.

Geographic Revenue

In addition to the revenue presentation by reportable segment, the company also measures revenue performance on a geographic basis. The following geographic, regional and country-specific revenue performance excludes OEM revenue, which is discussed separately on [page 51](#).

(\$ in millions)

For the year ended December 31:	2011	2010	Yr.-to-Yr. Percent Change	Yr.-to-Yr. Percent Change Adjusted for Currency
Total revenue	\$106,916	\$99,870	7.1%	3.4%
Geographies	\$104,170	\$97,060	7.3%	3.6%
Americas	44,944	42,044	6.9	6.2
Europe/Middle East/Africa	33,952	31,866	6.5	1.6
Asia Pacific	25,273	23,150	9.2	1.7
Major markets			5.1%	1.6%
Growth markets			16.0%	11.4%
BRIC countries			18.6%	16.1%

Total geographic revenue increased 7.3 percent (4 percent adjusted for currency) to \$104,170 million in 2011, led by strong performance in the growth markets.

(\$ in millions)

For the year ended December 31:	2011	2010	Yr.-to-Yr. Percent/ Margin Change
Systems and Technology			
External gross profit	\$7,555	\$6,856	10.2%
External gross profit margin	39.8%	38.1%	1.6 pts.
Pre-tax income	\$1,633	\$1,456	12.2%
Pre-tax margin	8.2%	7.8%	0.5 pts.
Pre-tax income—normalized*	\$1,652	\$1,513	9.2%
Pre-tax margin—normalized	8.3%	8.1%	0.3 pts.

* Excludes \$19 million and \$57 million of workforce rebalancing charges in the first quarter of 2011 and 2010, respectively.

The increase in external gross profit in 2011 versus 2010 was due to higher revenue and an improved overall gross profit margin.

Overall gross margin increased 1.6 points in 2011 versus the prior year. The increase was primarily driven by margin improvements in Power Systems (1.2 points), System z (0.4 points) and System x (0.6 points), partially offset by lower margins in Microelectronics (0.6 points) and Storage (0.2 points).

Systems and Technology's pre-tax income increased \$177 million (12.2 percent) to \$1,633 million in 2011 and on a normalized basis increased \$139 million to \$1,652 million in 2011, when compared to the prior year. Pre-tax margin increased 0.5 points, and on a normalized basis 0.3 points, versus the prior year.

Global Financing

See [pages 63 through 67](#) for an analysis of Global Financing's segment results.

The growth markets increased 16.0 percent (11 percent adjusted for currency) in 2011 and gained 4 points of market share. The growth markets strategy to expand into new markets, build out IT infrastructures and lead in specific industries has driven the strong performance and share gains. Revenue growth outpaced growth in the major markets by 10 points in 2011 on a constant currency basis. In the BRIC countries, revenue increased 18.6 percent (16 percent adjusted for currency) in 2011, with double-digit growth in each country. Overall in 2011, the company had double-digit constant currency revenue growth in nearly 40 growth market countries. These countries contributed nearly two-thirds of the company's 2011 constant currency revenue growth and represented 22 percent of total geographic revenue in 2011. To further drive market expansion, the company opened 92 new branches and added over 1,500 new sales resources in 2011.

Americas revenue increased 6.9 percent (6 percent adjusted for currency) in 2011. Within the major market countries, the U.S. increased 4.2 percent and Canada increased 14.3 percent (10 percent adjusted for currency). Revenue in the Latin America growth markets increased 16.9 percent (14 percent adjusted for currency) with growth in Brazil of 13.0 percent (9 percent adjusted for currency).

EMEA revenue increased 6.5 percent (2 percent adjusted for currency) in 2011 compared to 2010. In the major market countries, revenue growth was led by the UK up 9.4 percent (5 percent adjusted for currency), Spain up 11.2 percent (6 percent adjusted for currency), Germany up 5.8 percent (1 percent adjusted for currency) and France up 4.4 percent (flat adjusted for currency). Revenue in Italy decreased 0.6 percent (5 percent adjusted for currency). The EMEA growth markets increased 11.6 percent (10 percent adjusted for currency) in 2011, led by growth in Russia of 49.8 percent (49 percent adjusted for currency).

Asia Pacific revenue increased 9.2 percent (2 percent adjusted for currency) year over year. The Asia Pacific growth markets increased 16.8 percent (11 percent adjusted for currency), led by growth in China of 21.6 percent (18 percent adjusted for currency) and India of 10.9 percent (13 percent adjusted for currency). Japan revenue increased 2.0 percent (decreased 7 percent adjusted for currency).

OEM revenue of \$2,746 million in 2011 decreased 2.3 percent (3 percent adjusted for currency) compared to 2010, driven by the Microelectronics OEM business.

Total Expense and Other Income

(\$ in millions)

	2011	2010	Yr.-to-Yr. Percent/ Margin Change
For the year ended December 31:			
Total consolidated expense and other (income)	\$29,135	\$26,291	10.8%
Non-operating adjustments			
Amortization of acquired intangible assets	(289)	(253)	14.4
Acquisition-related charges	(45)	(46)	(1.8)
Non-operating retirement-related (costs)/income	74	210	(64.6)
Total operating (non-GAAP) expense and other (income)	\$28,875	\$26,202	10.2%
Total consolidated expense-to-revenue ratio	27.3%	26.3%	0.9 pts.
Operating (non-GAAP) expense-to-revenue ratio	27.0%	26.2%	0.8 pts.

Total expense and other (income) increased 10.8 percent in 2011 versus 2010. Total operating (non-GAAP) expense and other (income) increased 10.2 percent versus the prior year. The key drivers of the year-to-year change in total expense and other (income) for both expense presentations were approximately:

- Currency* 4 points
- Acquisitions** 3 points
- Base expense 3 points

*Reflects impacts of translation and hedging programs.

**Includes acquisitions completed in prior 12-month period.

For additional information regarding total expense and other income, see the following analyses by category.

Selling, General and Administrative

(\$ in millions)

For the year ended December 31:	2011	2010	Yr.-to-Yr. Percent Change
Selling, general and administrative expense			
Selling, general and administrative—other	\$20,287	\$18,585	9.2%
Advertising and promotional expense	1,373	1,337	2.7
Workforce rebalancing charges	440	641	(31.3)
Retirement-related costs	603	494	22.1
Amortization of acquired intangible assets	289	253	14.4
Stock-based compensation	514	488	5.4
Bad debt expense	88	40	116.6
Total consolidated selling, general and administrative expense	\$23,594	\$21,837	8.0%
Non-operating adjustments			
Amortization of acquired intangible assets	(289)	(253)	14.4
Acquisition-related charges	(20)	(41)	(52.3)
Non-operating retirement-related (costs)/income	(13)	84	NM
Operating (non-GAAP) selling, general and administrative expense	\$23,272	\$21,628	7.6%

NM—Not meaningful

Total SG&A expense increased 8.0 percent (5 percent adjusted for currency) in 2011 versus 2010. Overall the increase was driven by currency impacts (3 points), acquisition-related spending (3 points) and base expense (2 points). Operating (non-GAAP) SG&A expense increased 7.6 percent (5 percent adjusted for currency) primarily driven by the same factors. Workforce rebalancing charges decreased \$201 million due primarily to actions taken in the first quarter of 2010 (\$558 million). Bad debt expense increased \$47 million in 2011 primarily due to higher receivable balances and the economic environment in Europe. The accounts receivable provision coverage was 1.5 percent at December 31, 2011, a decrease of 30 basis points from year-end 2010.

Other (Income) and Expense

(\$ in millions)

For the year ended December 31:	2011	2010	Yr.-to-Yr. Percent Change
Other (income) and expense

Operating (non-GAAP) other (income) and expense	\$ (45)	\$ (791)	(94.3)%

NM—Not meaningful

Other (income) and expense was income of \$20 million and \$787 million for 2011 and 2010, respectively. The decrease in income in 2011 was primarily driven by the net gain (\$591 million) from the PLM transaction recorded in the first quarter of 2010 and a net gain associated with the disposition of a joint venture in the third quarter of 2010 (\$57 million) reflected in Other in the table above. In addition, foreign currency rate volatility drove higher foreign currency transaction losses (\$210 million) and lower gains on derivative instruments (\$126 million). These decreases in income were partially offset by higher net gains from securities and investment asset sales (\$258 million), primarily in the first quarter of 2011.

Research, Development and Engineering

(\$ in millions)

For the year ended December 31:	2011	2010	Yr.-to-Yr. Percent Change
Total consolidated research, development and engineering			
	\$6,258	\$6,026	3.8%
Non-operating adjustment			
Non-operating retirement-related (costs)/income	88	126	(30.4)
Operating (non-GAAP) research, development and engineering	\$6,345	\$6,152	3.1%

The company continues to invest in research and development, focusing its investments on high-value, high-growth opportunities and to extend its technology leadership. Total RD&E expense increased 3.8 percent in 2011 versus 2010, primarily driven by acquisitions (up 4 points) and currency impacts (up 2 points), partially offset by base expense (down 2 points). Operating (non-GAAP) RD&E expense increased 3.1 percent in 2011 compared to the prior year primarily driven by the same factors. RD&E investments represented 5.9 percent of revenue in 2011, compared to 6.0 percent in 2010.

Intellectual Property and Custom Development Income

(\$ in millions)			
For the year ended December 31:	2011	2010	Yr.-to-Yr. Percent Change
Sales and other transfers of intellectual property	\$ 309	\$ 203	52.3%
Licensing/royalty-based fees	211	312	(32.5)
Custom development income	588	638	(8.0)
Total	\$1,108	\$1,154	(4.0)%

The timing and amount of sales and other transfers of IP may vary significantly from period to period depending upon timing of divestitures, industry consolidation, economic conditions and the timing of new patents and know-how development. There were no significant individual IP transactions in 2011 or 2010.

Interest Expense

(\$ in millions)			
For the year ended December 31:	2011	2010	Yr.-to-Yr. Percent Change
Interest expense			
Total	\$411	\$368	11.6%

The increase in interest expense in 2011 versus 2010 was primarily driven by higher average debt levels, partially offset by lower average interest rates. Interest expense is presented in cost of financing in the Consolidated Statement of Earnings only if the related external borrowings are to support the Global Financing external business. See [pages 66 and 67](#) for additional information regarding Global Financing debt and interest expense. Overall interest expense (excluding capitalized interest) for 2011 was \$964 million, an increase of \$41 million year to year.

Income Taxes

The effective tax rate for 2011 was 24.5 percent compared with 24.8 percent in 2010. The operating (non-GAAP) tax rate for 2011 was 24.5 percent compared with 24.4 percent in 2010. The 0.3 point decrease in the as-reported effective tax rate was primarily driven by a more favorable geographic mix of pre-tax earnings (0.6 points), the lack of prior year impacts related to certain intercompany payments made by foreign subsidiaries (6.6 points) and a reduced impact associated with the intercompany licensing of certain intellectual property and acquisition integration costs (2.2 points). These benefits were offset by a decrease in the utilization of foreign tax credits (3.7 points) and a decrease in the benefits associated with the settlements of the U.S. federal income tax audit (5.5 points). The remaining items were individually insignificant.

Financial Position

Cash and cash equivalents at year end was \$11,922 million, an increase of \$271 million from the prior year-end position. During 2011, the company continued to manage its investment portfolio to meet its capital preservation and liquidity objectives, which resulted in a shift to higher rated institutions. At year end, a significant portion of the investment portfolio was invested in U.S. sovereign instruments with no holdings of European sovereign debt securities.

Total debt of \$31,320 million increased \$2,695 million from the prior year-end level. The commercial paper balance at December 31, 2011 was \$2,300 million, an increase of \$1,156 million from the prior year. Within total debt, \$23,332 million is in support of the Global Financing business which is leveraged at a 7.2 to 1 ratio. The company continued to have substantial flexibility in the market. During 2011, the company completed bond issuances totaling \$4,850 million, with terms ranging from three to 10 years and priced from 0.875 to 2.90 percent depending on the maturity. In addition, the company renewed its \$10 billion global credit facility for five years, with 100 percent of the facility available on a same day basis.

Consistent with accounting standards the company remeasured the funded status of its retirement and postretirement plans at December 31. At December 31, 2011, the overall net underfunded position was \$16,389 million, an increase of \$2,654 million from December 31, 2010 as the increase in the benefit obligation due to the reduction in discount rates more than offset the returns on plan assets. At year end, the company's qualified defined benefit plans were well funded and its cash requirements related to these plans remained stable going forward. In 2011, the return on the U.S. Personal Pension Plan assets was 8.4 percent and the plan was 98 percent funded. Overall, global asset returns were 6.1 percent and the company's qualified defined benefit plans worldwide were 96 percent funded.

The company's qualified defined benefit plans do hold European sovereign debt securities in their trust funds. See note S, "Retirement-Related Benefits," on [page 128](#) for additional information.

During 2011, the company generated \$19,846 million in cash from operations, an increase of \$298 million compared to 2010. In addition, the company generated \$16,604 million in free cash flow in 2011, an increase of \$305 million over the prior year. See [pages 56 and 57](#) for additional information on free cash flow. The company returned \$18,519 million to shareholders in 2011, with \$15,046 million in gross share repurchases and \$3,473 million in dividends. In 2011, the company repurchased approximately 89 million shares and had \$8.7 billion remaining in share repurchase authorization at year end. The company has consistently generated strong cash from operations and strong free cash flow and this permits the company to invest and deploy capital to areas with the most attractive long-term opportunities.

GAAP Reconciliation

The tables below provide a reconciliation of the company's income statement results as reported under GAAP to its operating earnings presentation which is a non-GAAP measure. The company's calculation of operating earnings, as presented, may differ from similarly titled measures reported by other companies. Please refer to the "Operating (non-GAAP) Earnings" section on [page 18](#) for the company's rationale for presenting operating earnings information.

Other Information

Looking Forward

In 2012, the company delivered revenue of \$104.5 billion, net income of \$16.6 billion, up 4.7 percent and earnings per share of \$14.37, an increase of 10.0 percent compared to 2011. Operating (non-GAAP) earnings per share was \$15.25, an increase of 13.5 percent versus the prior year. The 2012 results put the company well on track to its 2015 operating earnings per share road map objective.

The company measures the success of its business model over the long term, not any individual quarter or year. The company's strategies, investments and actions are all taken with an objective of optimizing long-term performance.

In May 2010, the company met with investors and introduced a road map for earnings per share in 2015. The objective of the road map for growth is to achieve at least \$20 of operating (non-GAAP) earnings per diluted share in 2015. The company has identified the major drivers of financial performance: revenue growth, margin expansion and common stock share repurchase. The revenue growth will come from a combination of base revenue growth, a shift to faster growing businesses and from acquisitions closed between 2010 and 2015. The contribution from margin expansion will be driven by the mix of higher margin businesses and enterprise productivity. The company will also continue to return value to its shareholders, with approximately \$50 billion of gross share repurchases and \$20 billion of dividends expected during the road map period.

Looking forward, the company expects to continue its transformation in 2013. The company will continue to acquire key capabilities, divest of certain businesses, rebalance its workforce and invest in innovation. The company continues to retool its skills and offerings to shift to higher value content and meet its clients' needs. The company's expectation for 2013 includes all these factors. In January 2013, the company disclosed that it is expecting GAAP earnings of at least \$15.53 and operating (non-GAAP) earnings of at least \$16.70 per diluted share for the full year 2013. The operating (non-GAAP) earnings per share expectation excludes acquisition-related charges of \$0.48 per share and non-operating retirement-related costs of \$0.69 per share. This expectation results in an increase year to year of 8 percent in GAAP earnings per share and an increase of 10 percent year to year in operating (non-GAAP) earnings per share which keeps the company on track to its 2015 objective. On an operating (non-GAAP) basis, the company expects the first half earnings per share growth rate to be slightly higher than the growth rate in the second half primarily driven by the new System z mainframe content and the resulting year-to-year product cycle impacts.

From a segment perspective, the Software business once again delivered strong results in 2012 and continued market leadership. The company expects the Software business to continue its momentum in 2013 and deliver revenue growth in the mid single-digits on a constant currency basis with strong profit contribution. Within Global Services, entering 2013, the company will continue to drive its key plays and shift toward higher value content. The company will

continue to invest in the growth markets—which represent over 20 percent of services revenue and where the company sees the most opportunity for growth. The company will continue to transform the services portfolio to higher value content, and away from the more commoditizing labor-based content. Global Services profit and margin performance will continue to benefit from the work being done to infuse more IP content into its offerings. In addition, Global Services will continue to be the prime beneficiary of the focus on enterprise productivity. The company believes that Global Services has a good set of opportunities to continue to drive profit growth and margin expansion in 2013. As a result, the company expects the Global Services business to deliver profit growth in 2013, consistent with its business model expectations, with double-digit profit growth in the first quarter. In addition, with its backlog growth and the mix toward longer duration engagements, the company expects Global Business Services to return to revenue growth at constant currency in 2013. Within Systems and Technology, looking forward to 2013, performance in the first half of the year will be defined by the momentum related to the System z mainframe content. The company expects that momentum to drive double-digit profit growth in Systems and Technology in the first half of 2013.

The economy could impact the credit quality of the company's receivables, and therefore the allowance for credit losses. The company will continue to apply its rigorous credit policies and analysis, and will also continue to monitor the current economic environment, particularly in Europe. Total receivables in Portugal, Italy, Ireland, Greece and Spain were approximately \$2.7 billion and \$2.6 billion, net of allowances, and represented approximately 7 percent of total net trade and financing accounts receivables at December 31, 2012 and 2011, respectively. The company will continue to monitor potential exposures in these countries in conjunction with the application of its credit policies.

The company expects 2013 pre-tax retirement-related plan cost to be approximately \$3.1 billion, an increase of approximately \$700 million compared to 2012. This estimate reflects current pension plan assumptions at December 31, 2012. Within total retirement-related plan cost, operating retirement-related plan cost is expected to be approximately \$1.9 billion, an increase of approximately \$100 million versus 2012. Non-operating retirement-related plan cost is expected to be approximately \$1.1 billion, an increase of approximately \$600 million, compared to 2012. See note S, "Retirement-Related Benefits," on [pages 120 to 134](#) for additional information.

The company expects in the normal course of business that its effective tax rate and operating (non-GAAP) tax rate will be approximately 25 percent in 2013. The rate will change year to year based on non-recurring events, such as the settlement of income tax audits and changes in tax laws, as well as recurring factors including the geographic mix of income before taxes, the timing and amount of foreign dividend repatriation, state and local taxes and the effects of various global income tax strategies.

Liquidity and Capital Resources

The company has consistently generated strong cash flow from operations, providing a source of funds ranging between \$18.8 billion and \$20.8 billion per year over the past five years. The company provides for additional liquidity through several sources: maintaining an adequate cash balance, access to global funding sources, a committed global credit facility and other committed and uncommitted lines of credit worldwide. The following table provides a summary of the major sources of liquidity for the years ended December 31, 2008 through 2012.

Cash Flow and Liquidity Trends

(\$ in billions)

	2012	2011	2010	2009	2008
Net cash from operating activities	\$19.6	\$19.8	\$19.5	\$20.8	\$18.8
Cash and short-term marketable securities	\$11.1	\$11.9	\$11.7	\$14.0	\$12.9
Committed global credit facility	\$10.0	\$10.0	\$10.0	\$10.0	\$10.0

The major rating agencies' ratings on the company's debt securities at December 31, 2012 appear in the following table. The Standard and Poor's ratings reflect an upgrade on May 30, 2012. The other agency ratings remain unchanged from December 31, 2011. The company's debt securities do not contain any acceleration clauses which could change the scheduled maturities of the obligation. In addition, the company does not have "ratings trigger" provisions in its debt covenants or documentation, which would allow the holders to declare an event of default and seek to accelerate payments thereunder in the event of a change in credit rating. The company's contractual agreements governing derivative instruments contain standard market clauses which can trigger the termination of the agreement if the company's credit rating were to fall below investment grade. At December 31, 2012, the fair value of those instruments that were in a liability position was \$503 million, before any applicable netting, and this position is subject to fluctuations in fair value period to period based on the level of the company's outstanding instruments and market conditions. The company has no other contractual arrangements that, in the event of a change in credit rating, would result in a material adverse effect on its financial position or liquidity.

	Standard & Poor's	Moody's Investors Service	Fitch Ratings
Senior long-term debt	AA-	Aa3	A+
Commercial paper	A-1+	Prime-1	F1

The company prepares its Consolidated Statement of Cash Flows in accordance with applicable accounting standards for cash flow presentation on [page 73](#) and highlights causes and events underlying sources and uses of cash in that format on [page 36](#). For the purpose of running its business, the company manages, monitors and analyzes cash flows in a different format.

Management uses a free cash flow measure to evaluate the company's operating results, plan share repurchase levels, evaluate strategic investments and assess the company's ability and need to incur and service debt. Free cash flow is not a defined term under GAAP and it should not be inferred that the entire free cash flow amount is available for discretionary expenditures. The company defines free cash flow as net cash from operating activities less the change in Global Financing receivables and net capital expenditures, including the investment in software. As discussed on [page 24](#), a key objective of the Global Financing business is to generate strong returns on equity. Increasing receivables is the basis for growth in a financing business. Accordingly, management considers Global Financing receivables as a profit-generating investment, not as working capital that should be minimized for efficiency. After considering Global Financing receivables as an investment, the remaining net operational cash flow less net capital expenditures is viewed by the company as free cash flow.

Net cash from operating activities per GAAP was \$19.6 billion in 2012, a decrease of \$0.3 billion from the prior year. As discussed on [page 36](#), a key driver was a decrease in cash provided by receivables, primarily Global Financing receivables, which increased \$3.2 billion year to year. The increase in Global Financing receivables resulted from an increase in originations primarily driven by an improved participation rate. From the perspective of how management views cash flow, in 2012, free cash flow was \$18.2 billion, an increase of \$1.6 billion compared to 2011. The increase was primarily driven by the increase in net income and a reduction in income tax payments as a result of audit settlements in 2011. Within its strong free cash flow performance, the company increased its capital expenditures by \$0.2 billion versus the prior year.

In 2012, the company continued to focus its cash utilization on returning value to shareholders including \$3.8 billion in dividends and \$10.5 billion in net stock transactions, including the common stock repurchase program. In addition, \$3.7 billion was utilized to acquire 11 companies. For the full year, the company generated \$18.2 billion in free cash flow and utilized \$18.0 billion on acquisitions, net share repurchases and dividends.

Over the past five years, the company generated over \$80 billion in free cash flow. During that period, the company invested nearly \$19 billion in strategic acquisitions and returned over \$61 billion to shareholders through dividends and net share repurchases. The amount of prospective returns to shareholders in the form of dividends and share repurchases will vary based upon several factors including each year's operating results, capital expenditure requirements, research and development investments and acquisitions, as well as the factors discussed on [page 57](#).

The company's Board of Directors meets quarterly to consider the dividend payment. In the second quarter of 2012, the Board of Directors increased the company's quarterly common stock dividend from \$0.75 to \$0.85 per share.

The table below represents the way in which management reviews cash flow as described on [page 56](#).

(\$ in billions)					
For the year ended December 31:	2012	2011	2010	2009	2008
Net cash from operating activities per GAAP	\$ 19.6	\$ 19.8	\$ 19.5	\$ 20.8	\$ 18.8
Less: the change in Global Financing receivables	(2.9)	(0.8)	(0.7)	1.9	(0.0)
Net cash from operating activities, excluding Global Financing receivables	22.5	20.7	20.3	18.9	18.8
Capital expenditures, net	(4.3)	(4.1)	(4.0)	(3.7)	(4.5)
Free cash flow	18.2	16.6	16.3	15.1	14.3
Acquisitions	(3.7)	(1.8)	(5.9)	(1.2)	(6.3)
Divestitures	0.6	0.0	0.1	0.4	0.1
Share repurchase	(12.0)	(15.0)	(15.4)	(7.4)	(10.6)
Dividends	(3.8)	(3.5)	(3.2)	(2.9)	(2.6)
Non-Global Financing debt	0.7	1.7	2.3	(4.7)	(3.2)
Other (includes Global Financing receivables and Global Financing debt)	(0.8)	2.3	3.5	1.7	5.0
Change in cash, cash equivalents and short-term marketable securities	\$ (0.8)	\$ 0.3	\$ (2.3)	\$ 1.1	\$ (3.2)

Events that could temporarily change the historical cash flow dynamics discussed above include significant changes in operating results, material changes in geographic sources of cash, unexpected adverse impacts from litigation, future pension funding requirements during periods of severe downturn in the capital markets or the timing of tax payments. Whether any litigation has such an adverse impact will depend on a number of variables, which are more completely described in note M, "Contingencies and Commitments," on [pages 110 through 112](#). With respect to pension funding, in 2012, the company contributed \$617 million to its non-U.S. defined benefit plans versus \$798 million in 2011. As highlighted in the Contractual Obligations table on [page 58](#), the company expects to make legally mandated pension plan contributions to certain non-U.S. plans of approximately \$4.0 billion in the next five years. The 2013 contributions are currently expected to be approximately \$700 million. Financial market performance and/or further weakening in the European sovereign debt credit environment in 2013 could increase the legally mandated minimum contributions in certain non-U.S. countries that require more frequent remeasurement of the funded status. The company is not quantifying any further impact from pension funding because it is not possible to predict future movements in the capital markets or pension plan funding regulations.

The Pension Protection Act of 2006 was enacted into law in 2006, and, among other things, increases the funding requirements for certain U.S. defined benefit plans beginning after December 31, 2007. No mandatory contribution is required for the U.S. defined benefit plan in 2013 as of December 31, 2012.

The company's U.S. cash flows continue to be sufficient to fund its current domestic operations and obligations, including investing and financing activities such as dividends and debt service. The company's U.S. operations generate substantial cash flows, and, in those circumstances where the company has additional cash requirements in the U.S., the company has several liquidity options available. These options may include the ability to borrow additional funds at reasonable interest rates, utilizing its committed global credit facility, repatriating certain foreign earnings and utilizing inter-company loans with certain foreign subsidiaries.

The company does earn a significant amount of its pre-tax income outside the U.S. The company's policy is to indefinitely reinvest the undistributed earnings of its foreign subsidiaries, and accordingly, no provision for federal income taxes has been made on accumulated earnings of foreign subsidiaries. The company periodically repatriates a portion of these earnings to the extent that it does not incur an additional U.S. tax liability. Quantification of the deferred tax liability, if any, associated with indefinitely reinvested earnings is not practicable. While the company currently does not have a need to repatriate funds held by its foreign subsidiaries, if these funds are needed for operations and obligations in the U.S., the company could elect to repatriate these funds which could result in a reassessment of the company's policy and increased tax expense.

Contractual Obligations

(\$ in millions)

	Total Contractual Payment Stream	Payments Due In			
		2013	2014-15	2016-17	After 2017
Long-term debt obligations	\$29,599	\$ 5,548	\$ 6,444	\$ 7,570	\$10,037
Interest on long-term debt obligations	9,842	1,014	1,617	1,410	5,800
Capital (finance) lease obligations	61	13	24	19	6
Operating lease obligations	5,806	1,466	2,312	1,281	747
Purchase obligations	1,383	559	618	139	68
Other long-term liabilities					
Minimum pension funding (mandated)*	4,000	700	1,600	1,700	—
Executive compensation	1,595	94	206	229	1,066
Long-term termination benefits	1,283	221	174	126	763
Tax reserves**	3,942	1,724	—	—	—
Other	1,107	60	91	81	876
Total	\$58,619	\$11,398	\$13,086	\$12,554	\$19,363

* As funded status on plans will vary, obligations for mandated minimum pension payments after 2017 could not be reasonably estimated.

** These amounts represent the liability for unrecognized tax benefits. The company estimates that approximately \$1,724 million of the liability is expected to be settled within the next 12 months. The settlement period for the noncurrent portion of the income tax liability cannot be reasonably estimated as the timing of the payments will depend on the progress of tax examinations with the various tax authorities; however, it is not expected to be due within the next 12 months.

Total contractual obligations are reported in the table above excluding the effects of time value and therefore, may not equal the amounts reported in the Consolidated Statement of Financial Position.

Purchase obligations include all commitments to purchase goods or services of either a fixed or minimum quantity that meet any of the following criteria: (1) they are noncancelable, (2) the company would incur a penalty if the agreement was canceled, or (3) the company must make specified minimum payments even if it does not take delivery of the contracted products or services (take-or-pay). If the obligation to purchase goods or services is non-cancelable, the entire value of the contract is included in the table above. If the obligation is cancelable, but the company would incur a penalty if canceled, the dollar amount of the penalty is included as a purchase obligation. Contracted minimum amounts specified in take-or-pay contracts are also included in the table as they represent the portion of each contract that is a firm commitment.

In the ordinary course of business, the company enters into contracts that specify that the company will purchase all or a portion of its requirements of a specific product, commodity or service from a supplier or vendor. These contracts are generally entered into in order to secure pricing or other negotiated terms. They do not specify fixed or minimum quantities to be purchased and, therefore, the company does not consider them to be purchase obligations.

Interest on floating-rate debt obligations is calculated using the effective interest rate at December 31, 2012, plus the interest rate spread associated with that debt, if any.

Off-Balance Sheet Arrangements

From time to time, the company may enter into off-balance sheet arrangements as defined by the SEC Financial Reporting Release 67 (FRR-67), "Disclosure in Management's Discussion and Analysis about Off-Balance Sheet Arrangements and Aggregate Contractual Obligations."

At December 31, 2012, the company had no off-balance sheet arrangements that have, or are reasonably likely to have, a material current or future effect on financial condition, changes in financial condition, revenues or expenses, results of operations, liquidity, capital expenditures or capital resources. See the table above for the company's contractual obligations, and note M, "Contingencies and Commitments," on page 113, for detailed information about the company's guarantees, financial commitments and indemnification arrangements. The company does not have retained interests in assets transferred to unconsolidated entities or other material off-balance sheet interests or instruments.

Critical Accounting Estimates

The application of GAAP requires the company to make estimates and assumptions about certain items and future events that directly affect its reported financial condition. The accounting estimates and assumptions discussed in this section are those that the company considers to be the most critical to its financial statements. An accounting estimate is considered critical if both (a) the nature of the estimate or assumption is material due to the levels of subjectivity and judgment involved, and (b) the impact within a reasonable range of outcomes of the estimate and assumption is material to the company's financial condition. Senior management has discussed the development, selection and disclosure of these estimates with the Audit Committee of the company's Board of Directors. The company's significant accounting policies are described in note A, "Significant Accounting Policies," on [pages 76 to 86](#).

A quantitative sensitivity analysis is provided where that information is reasonably available, can be reliably estimated and provides material information to investors. The amounts used to assess sensitivity (e.g., 1 percent, 10 percent, etc.) are included to allow users of the Annual Report to understand a general direction cause and effect of changes in the estimates and do not represent management's predictions of variability. For all of these estimates, it should be noted that future events rarely develop exactly as forecasted, and estimates require regular review and adjustment.

Pension Assumptions

For the company's defined benefit pension plans, the measurement of the company's benefit obligation to employees and net periodic pension (income)/cost requires the use of certain assumptions, including, among others, estimates of discount rates and expected return on plan assets.

Changes in the discount rate assumptions will impact the (gain)/loss amortization and interest cost components of the net periodic pension (income)/cost calculation (see [page 126](#) for information regarding the discount rate assumptions) and the projected benefit obligation (PBO). The company decreased the discount rate assumption for the IBM Personal Pension Plan (PPP), a U.S.-based defined benefit plan, by 60 basis points to 3.60 percent on December 31, 2012. This change will increase pre-tax cost and expense recognized in 2013 by an estimated \$156 million. If the discount rate assumption for the PPP increased by 60 basis points on December 31, 2012, pre-tax cost and expense recognized in 2013 would have decreased by an estimated \$200 million. Changes in the discount rate assumptions will impact the PBO which, in turn, may impact the company's funding decisions if the PBO exceeds plan assets. Each 25 basis point increase or decrease in the discount rate will cause a corresponding decrease or increase, respectively, in the PPP's PBO of an estimated \$1.4 billion based upon December 31, 2012 data.

The expected long-term return on plan assets assumption is used in calculating the net periodic pension (income)/cost (see [page 126](#) for information regarding the expected long-term return on plan assets assumption). Expected returns on plan assets are calculated based on the market-related value of plan assets, which recognizes changes in the fair value of plan assets systematically over a five-year period in the expected return on plan assets line in net periodic pension (income)/cost. The differences between the actual return on plan assets and the expected long-term return on plan assets are recognized over five years in the expected return on plan assets line in net periodic pension (income)/cost and also as a component of actuarial gains/losses, which are recognized over the service lives of the employees in the plan, provided such amounts exceed thresholds which are based upon the obligation or the value of plan assets, as provided by accounting standards.

To the extent the outlook for long-term returns changes such that management changes its expected long-term return on plan assets assumption, each 50 basis point increase or decrease in the expected long-term return on PPP plan assets assumption will have an estimated increase or decrease, respectively, of \$249 million on the following year's pre-tax net periodic pension (income)/cost (based upon the PPP's plan assets at December 31, 2012 and assuming no contributions are made in 2013).

The company may voluntarily make contributions or be required, by law, to make contributions to its pension plans. Actual results that differ from the estimates may result in more or less future company funding into the pension plans than is planned by management. Impacts of these types of changes on the company's pension plans in other countries worldwide will vary depending upon the status of each respective plan.

Revenue Recognition

Application of the various accounting principles in GAAP related to the measurement and recognition of revenue requires the company to make judgments and estimates. Specifically, complex arrangements with nonstandard terms and conditions may require significant contract interpretation to determine the appropriate accounting, including whether the deliverables specified in a multiple element arrangement should be treated as separate units of accounting. Other significant judgments include determining whether IBM or a reseller is acting as the principal in a transaction and whether separate contracts are considered part of one arrangement.

Revenue recognition is also impacted by the company's ability to estimate sales incentives, expected returns and collectibility. The company considers various factors, including a review of specific transactions, the creditworthiness of the customers, historical experience and market and economic conditions when calculating these provisions and allowances. Evaluations are conducted each quarter to assess the adequacy of the estimates. If these estimates were changed by 10 percent in 2012, net income would have been impacted by \$79 million (excluding Global Financing receivables discussed on [page 63](#)).

Costs to Complete Service Contracts
